Page 417, col. ii, line 12 from bottom. For "qualification" read "qualificative."

The Nation.

NEW YORK, THURSDAY, JANUARY 5, 1888.

The Week.

THE minority report of Mr. Pattison of the Pacific Railway Commission seems to be the wildest official production that has ever appeared in print since the Pacific Railroad was opened for business. Mr. Pattison recommends that all plans for recovering the Government's money be made subordinate to the "punishment of the criminals," and that the first step to be taken should be the forfeiture of the charters of both roads. How this forfeiture should be accomplished is not made very clear. If it is to be done by act of Congress, the fact that the Central Pacific's charter was granted by the State of California might constitute an obstacle. If it is to be done by a suit at law in which the United States is to figure as plaintiff, it might be objected that under the terms of the original act the debt to the Government is not due until some ten years hence, and that under the Thurman Act nothing is due except certain payments to the sinking fund, which have been duly made in accordance with the terms of that act. It might and would be set up in bar of such a suit that when the Government established a mode of payment by the Thurman Act, and received payments under the same, it was estopped from forfeiture proceedings as to any acts or things occurring before that time, so long as the terms of the act are complied with. The whole scope of Mr. Pattison's report bears the impress of crankiness. It is fortunate that two members of the Commission kept the main object of their appointment in view, and sought diligently for means to get the Government's money paid, just as any right-minded attorney of a creditor would do in handling a debtor's estate.

The main points of the report of the Commission are that the companies shall execute a formal mortgage to the Government in place of the present statutory mortgage, and shall include in it their branch lines and all their property; that thereupon the debt shall be extended to fifty years at 3 per cent. interest, payable semi-annually, with a sinking fund of one-half of one per cent. for the first ten years, at the end of which period a sinking fund shall be established which will pay off the whole debt at maturity. To this is added a proviso that the roads shall empower the Attorney-General of the United States to bring any suit he may see fit in behalf of the companies to secure restitution of moneys due to the companies from any private individual or corporation. This plan is perfectly rational throughout. It ought to be adopted by Congress at an early day.

The Stock Exchange seems to have taken amiss the action of the Vanderbilt roads in not increasing their dividends in proportion to their earnings, the quotations for all of them falling slightly after the decision was made. Probably a more rational view will be taken after a few days. The action of the companies was conservative and prudent in a high degree, as was also that of the Lackawanna Company, which decided in like manner to lay up a reserve fund against a rainy day. There are surpluses and surpluses—some which represent losses in former years, and which stand on the ledger for an indefinite period because the managers have not the courage to write them off the books. Very few of those venerable surpluses are available to make good a shrinkage of earnings in a bad year. But there can be no doubt, apparently, that the surplus kept back by the New York Central, Lake Shore, Michigan Central, and Canada Southern from the present dividends is a real reserve, which may be used either to make good a deficiency in some other year, or to avoid borrowing in case a necessary improvement is called for. In either case, the shares of the companies ought to advance rather than decline. It requires some courage to face discontented shareholders and withhold from them money which they think belongs to them, but it is only the first step that costs. It will be easier the next time. The experience of all these roads during the past five years teaches that no company can afford to distribute its entire earnings in times of prosperity. If the New York Central had divided only 6 per cent. during the heyday of good times, and had kept the balance in available form for the bad times that were threatened and that actually followed, it might have gone through the West Shore crisis without passing a dividend.

There has been no more melancholy sight in this country since the abolition of slavery than that afforded by the strike of the poor men in the employ of the Reading Railroad, at the beginning of the winter, most of them with families dependent on them. They had no grievance against the company except that it would not allow the train hands to decide for whom it shall carry freight, and they were controlled, under the organization of the Knights of Labor, by a band of scheming adventurers who insisted on the company's submitting this question to "arbitration," and levy money from the laborers' wages for salaries and office rent. There is no use in blaming the Powderlys, and Quinns, and Lees, and the like, for trying to live by organizing, and holding meetings, and issuing orders. Tens of thousands of men in all ranks of life would live in the same way if they could get the chance. What is most to be deplored in the matter is the immense mass of childish ignorance which these strikes represent, and which makes the "Grand Masters" and the "General Worthy Foremen" possible. Mayor Hewitt, on Thursday night, at the dinner of the Board of Trade, spoke some telling words about the responsibility of the class of politicians who encourage these "secret and irresponsible organizations" in their attacks on the peace and industry of the country, by pretending to think their existence and activity justified by the conduct of "capital."

It usually happens, in disputes and strikes where the Knights of Labor are concerned, that there are a lot of "private understandings" relied upon by the master workmen and executive committees to justify themselves to the public and their own followers. These private understandings usually consist of hints, winks, insinuations, or other deceptive contrivances on the part of the employer which convey to the master workmen, etc., the idea that if they will order the strike off, their demands will be complied with in some roundabout way. The history of the great Southwestern strike was full of such private understandings between Gen. Hoxie and Martin Irons, and even Mr. Powderly had resort to one such understanding with Jay Gould, although the written correspondence and short-hand report of the conversation between the parties proved conclusively that there was not and could not have been any such understanding. The Reading strike has yielded the usual crop of whispered agreements, the most important being the pretended agreement between the Superintendent and the Strike Committee to submit the differences to arbitration. Everybody with the least grain of intelligence must have seen that there was no room for arbitration, since there was no question of wages, or hours, or methods of labor to submit to arbitrators. The question in dispute was whether the Reading Company should obey a law which requires it to transport freight for all persons offering the same without discrimination. Was there anything here to arbitrate upon? Arbitration implies that a decision may be given against you, and that if it is, you must abide by it. It can have no other meaning. Suppose that the arbitrators in the supposed case were to decide that the Reading Company need not carry the flour of Taylor & Sons? Would such a decision relieve them from penalties under the Inter-State Commerce Act or under the law of Pennsylvania? Suppose the arbitrators were to decide that, although the Reading Company were obliged to carry the flour of Taylor & Sons, yet, if their employees refused to move the cars, the company had no right to put others in their places. Would such a decision save them from seizure by the sheriff? The very statement of the case shows that the alleged understanding between the Superintendent and the Knights was impossible. The evident truth is, that it was a fiction invented by the Committee to preserve their credit with their own deluded followers.

We are glad to say a publishers' copyright league has been formed to coöperate with the

authors in trying to secure international copyright legislation this winter. The absence of this coöperation has been until now one of the great difficulties in the way of success; publishers, as "practical men" and extensive employers of labor, having more weight with Congressmen than writers of books. As long, too, as there was enough comity between publishers to secure respect for any arrangement which any one of them might make with foreign authors, they were not very zealous in favor of a copyright treaty. The pirate has destroyed all that, however, and convinced them that there is no security except in legislation. This will go far to narrow the opposition down to simple enjoyment of theft—or, in other words, of benefit of some kind at another man's expense. Nothing is more comic or more novel, and yet more characteristic of our age, than the argument which one frequently hears in opposition to international copyright, that although it is wrong to clothe or feed yourself, it is quite right, and even praiseworthy, to develop yourself mentally, with the proceeds of another man's labor.

Whatever may be done about the case of Dakota, it is to be hoped that nothing will come of the scheme reported to be under consideration at Washington for admitting several Territories as States at the same time. New Mexico and Montana, which are said to be included in this scheme, are not fit to become States, and will not be for some time to come. New Mexico is still largely a foreign community, and has no just claim to exercise an equal influence in the Senate with great States like New York and Pennsylvania. Montana still retains many of the elements of a frontier region, and it is not yet certain that it will not prove well to change the boundaries between Montana and adjoining Territories. Washington Territory has been so long settled by a homogeneous population that it has a just claim to admission as soon as the question of rectifying its eastern boundary line is settled; but Montana and New Mexico ought to serve a long apprenticeship yet. The evils of the Territorial condition are grossly exaggerated by the politicians who hope to get the State offices, and they are really but small. Even if they were much greater, they should not offset the evils to the nation of making States too soon—evils which have been forcibly illustrated in the case of Nevada. One experience of that sort is quite enough for all time.

We did not know how largely the national prosperity is due to the tariff on potatoes until we read Monday's *Tribune*. We then learned from an interview with a dealer in the article that if the duty of 15 cents per bushel were repealed or materially lowered, we should not be able to compete with European potatoes in our own markets. Scotland, it appears, is our fiercest competitor at Washington Market, but England, Holland, Belgium, Germany, and Denmark are pressing the Long Island farmer with great energy. "If," says this New York dealer, "they send as much as they do while there is still a fifteen-cent tariff on potatoes, what would be the limit of this supply if that much profit is added to each bushel? It would, I think, soon be found unprofitable to raise potatoes in America." It might be added—and the reflection will occur to every logical mind—that if we cannot raise potatoes without a tariff, we shall soon be unable to raise wheat or cotton without it, and that we are rapidly approaching the condition of not being able to earn a living off the most bountiful land in the world without a system of taxation that locks up $100,000,000 a year of our money. The poultry dealers are already complaining of the competition of foreign-laid eggs. The ice-cutters a few years ago wanted a duty on foreign ice, and thought that they were ill used because they didn't get it. The fishermen have upset the Treaty of Washington and got us into a deal of trouble for the sake of a duty on salt fish. And now the sorghum-boilers in Kansas are protesting against any meddling with the duty on sugar because they say that they can make sugar as cheaply as it can be made in Louisiana. A hod-carrier in this city lifted up his voice the other day against any disturbance of the tariff, fearing apparently that brick buildings erected by pauper labor might rush in here from Europe. As to coal, how often have we been told that although we have about thirty times as much of this mineral as Great Britain and Canada combined, we should be compelled to leave it in the earth and depend upon foreign supplies if the duty were removed. Indeed, we can imagine a condition in which we should all be thrown helpless on our backs, and be compelled to receive our food, clothing, and fuel from foreigners, giving them nothing in return. How long they would continue to supply us on those terms, heaven only knows.

Gov. Hill has certainly done himself credit by his message sent to the Legislature on Tuesday. It is a plain, sensible, straightforward document, without any bunkum or demagogy in it, or anything on which one cannot differ with him respectfully. His recommendations are in the main very good. He advocates spring municipal elections and a revision of the charter of this city; the provision of a special counsel to the Legislature, to revise bills before they become laws—an excellent suggestion, which he has already made; a revision of the tax laws of the State, with the view of making personal property "pay its just share"—a chimerical idea, against which the experience of the civilized world is everywhere running. Personal property in our day is too readily concealed to be a proper object of taxation at all. He recommends the abolition of the State Board of Charities and of the State Board of Health, and the transfer of their powers respectively to a single officer—a step in the right direction—and of the Board of Regents as a useless and purely ornamental body; the calling of the Constitutional Convention; the permission to the Court of Appeals to affirm a conviction if, in its opinion, there was sufficient evidence to warrant it besides testimony improperly admitted—a much-needed reform, which would save the court from much popular distrust. He argues at much length, and with force, in favor of the restriction of the confirming power of the Senate to the cases in which it is called for by the Constitution; but reserves his heaviest artillery for the refusal of the Legislature to provide for the State enumeration and apportionment. On the liquor question he is as dumb as an oyster, and has hardly a word to say for "labor"—except that the Board of Arbitration is in "fairly successful operation," which will be news to most people. Some of his topics need more comment than is possible in a mere summary; but, on the whole, he has acquitted himself much more like Gov. David B. Hill than the "Dave Hill" of last year, who has hitherto afforded so much sport to the Republicans by allowing himself to be put "in a hole."

Gov. Hill's removal of Messrs. Jay and Richmond from the State Civil-Service Commission has been looked for every day since he asked for their resignations last July, without giving any reason. They refused to resign on the very good ground that such places as theirs ought not to be vacated without some explanation to the public of the cause of the change. The usefulness of these gentlemen, however, was greatly diminished by the Governor's unconcealed hostility to the law which they were trying to enforce, and the influence of his example in instigating nearly all the State officials to violate or ignore it in a greater or less degree. Mr. Jay and Mr. Richmond had the prime qualification of thorough devotion to their duty, and gave their time and attention unstintingly for what was to men in their position practically no compensation. What the Governor's motives in removing them are, can of course only be guessed at. His new appointments do not shed much light on the matter. From Mr. Manning and Mr. Treadwell it is perhaps fair to expect an honest attempt to execute the law. As regards the new President of the Board, Gen. Sickles, we shall have to get used to him in the character of a reformer before being able to pass any judgment on his merits. It will not do, however, to condemn the new Commissioners in advance. No matter what we may think of the motives or manner of their appointment, we are bound to give them a fair trial, and hope for the best from them. Possibly the fact that they are the Governor's own selection may help to secure from him more cordial coöperation than he was willing to give their predecessors.

Col. Fellows has begun his term of office as District Attorney in a somewhat unusual manner by giving a public feast. At the same time he makes this sweeping promise: "For the next three years I shall endeavor to make the city of New York an unhealthy and unpleasant place for the

criminally disposed." This lays out as large a field of work as any man would wish to enter upon. The Mayor, who naturally feels some responsibility for the Colonel's "simple Christian life" in the District Attorney's office, hastens to remind him on his entrance upon its duties that there are 15,000 bail cases awaiting trial in the pigeonholes of the office, and says: "I know that you are sensible of the deplorable consequences which result from the failure to dispose of criminal charges and to assure a prompt trial and speedy punishment in case of conviction." Now the District Attorney can in no way make New York more "unhealthy and unpleasant for the criminally disposed" than by bringing these bail cases to trial. They are nearly all for violations of the excise laws, and the greater part of them are against men who have "pulls" in politics. For years the criminal machinery of the city has been paralyzed by "pulls" of this kind, and the reason is that the violators of the laws are also political workers, whose liquor-saloons and gambling-dens are centres of political activity. The Colonel has a great opportunity before him by striking down this most pernicious conspiracy against the laws.

A despatch from St. Paul, Minn., makes this announcement: "The State Railroad Commissioners to-day issued orders that after January 1 each upper berth in any sleeping-car run or operated upon any railroad in this State shall remain closed whenever the berth beneath the same shall be occupied by a passenger, until such upper berth shall be needed for actual occupancy." If this brief order could be put in force all over the country, one of the meanest advantages taken of the travelling public by the sleeping-car companies would no longer have to be submitted to. In explanation of this order it may be stated that the aim of the sleeping-car companies (after charging, in addition to the regular railroad rate, as much for a sleeping accommodation as is charged for a room and board in our best hotels) is to make every passenger pay as much as can be extorted from him. Each "section" of a sleeping-car contains two "berths." If a passenger hires a lower berth and the one above him is not taken, the porters are compelled by the company, under a severe penalty, to let down the upper berth when the lower one is made up, thus cutting off air and light and boxing up the lower occupant as closely as possible. The object of this order is to compel the lower occupant to pay for the breathing-room above him as well as his bed beneath.

Mr. Joseph Chamberlain's speech at the Toronto Board of Trade dinner was encouraging in the sense that it promised an amicable settlement of the fishery dispute. Whether the settlement comes through arbitration (which was recommended as a last resort by the New York Chamber of Commerce) or otherwise, the country will be thankful, and accordingly has reason to be thankful when so cool a participant as Mr. Chamberlain tells us that, in his opinion, a settlement will be reached. Mr. Chamberlain is opposed to commercial union between Canada and the United States, because it would lead shortly to political union, and he does not want to bring on political union by roundabout means. But he does not say, and probably he does not mean, that he would oppose political union coming by direct means in obedience to the mutual wishes of the two countries uninfluenced by trade relations. As an English diplomat, he could not favor any step looking to the loss of Canada, although the loss itself he might acquiesce in when it comes without his active agency.

The London correspondent of the *Tribune* ought to be a little more careful about the facts in forwarding "free-trade" stories to his paper. He said on Thursday morning that "if anything is certain, it is certain that an Irish Parliament would adopt a policy of protection," and that, therefore, "home rule once granted, the Liberals will be in as much trouble as the Tories about fair trade." If he had ever taken the trouble to read Gladstone's Home-Rule Bill—the most extreme yet spoken of—he would know that the right of levying customs duties was reserved to the British Parliament, and that the Irish Parliament would have no power whatever to make a tariff. But what can we expect from a correspondent of the *Tribune* when the editor says he never maintained that the election of Cleveland would endanger American industry?

The uproar in England over the fresh reductions made in the Irish rents is another very curious illustration of the way the government of that unfortunate country is carried on. The process of reducing the rents by a Government Commission so as to make them accord with the reduced price of produce was begun in 1881 under Mr. Gladstone's Land Act. They were cut down on an average about 20 per cent., and any rent so reduced was called a "judicial rent." The work had hardly been done, however, when produce began to fall still further, and it became evident that the tenants would find it just as hard to pay the judicial as the ante-judicial rent. When the Tories came into power in 1885, an appeal was made to them to revise the judicial rents, but it was sternly denied, and the "Plan of Campaign," *i. e.*, refusal to pay any rent unless the landlord agreed to further reduction, was adopted by the National League. When the Tories returned to office the second time after Gladstone's defeat on the home-rule issue, Parnell introduced a bill providing for further revision, but it was rejected with horror, Goschen denouncing it as a characteristically dishonest proposal, and one which, if adopted, would weaken the framework of society. Gladstone's revision of rents was bad enough; it would not do to repeat it. It was soon found, however, that the Liberal-Unionists would not support this position, and that if it were adhered to, there would have to be a dissolution of Parliament. So a bill was introduced providing that the accursed thing should be done, and we now see the result. It left poor Mr. Goschen, who had to push it through the House of Commons, in a pitiable condition about the framework of society. Neither he nor Lord Salisbury, however, probably expected such sweeping reductions as the Commissioners have made, because they not only put the landlords in a worse position than ever, but they go far to whitewash the "Plan of Campaign" and justify Parnell.

The "war scare" in Europe is kept up with reasonable diligence, but does not seem to make much progress. Side by side with the accounts of the military preparations, there are always accounts of a disposition to settle on easy terms. Most of the trouble comes from the existence of semi-official or "inspired" newspapers in the Continental capitals. Now and then—perhaps once in four or five years—they get "the straight tip" from their respective governments, and the result is that everything they say in the interval has a factitious weight, although it may be pure speculation. A war scare is the best mode of running up "sales" known to them, because, as long as the armaments are so large, war will always seem a not improbable contingency, and the "movements" of troops near the frontier a good thing to "work up," either editorially or "reportorially." The way Lord Randolph Churchill has turned this to account by appearing on the scene himself, shows what a talent he has for advertising, and what a man he would be to push a ready-made clothing business. His visit to St. Petersburg is of no more importance than that of any John Smith, but all Europe is wondering what it means.

Various signs point to a new era of extravagance in Mexican financiering, after the irksome economies of the past two years. The loan of $52,500,000 just authorized by Congress is, on its face, a scheme to pay old debts by contracting new and more onerous ones. The terms of the loan are so vaguely defined that a leading commercial journal of Mexico is unable to say what they mean; they may imply interest at 6 per cent., or, more likely, 8½, or, possibly, 15. The Congress, also, after the established and vicious manner of intrusting large powers to the President during a Congressional interim, gave him authority to renew lapsed subventions to railroads, to make concessions and grant subsidies to newly projected lines, to make contracts for the survey of public lands, and for the planting of colonies. It is very natural, then, that on the heels of the adjournment of Congress come reports of a multiplicity of new schemes to "develop the resources of the country." There may be little substantial fact back of some of these large-sounding enterprises, but their being talked of is a sure sign that the speculators confidently expect a return of the good times of the lavish Administration of Gonzales. When it is remembered that all this is accompanied by the same wide gap between governmental receipts and expenditures which has been characteristic of the last three years, it looks as if the old financial policy of "after us the deluge" were to be put in force again,

REFORM OF THE HOUSE BY CONSTITUTIONAL AMENDMENT.

To the end that the Constitutional Amendment for the reformation of the House of Representatives, which we lately presented, may be more clearly apprehended, we reduce to a few plain, concise points what it will accomplish and what it will not do :

(1.) It now takes thirteen months to pass from a Congressional election to the time when the members elected assemble. The proposed amendment will enable the people to change *one-half of the members of the House in one month*, and the other half in the same time that they can now do it. With this fact so plainly in view, we are at a loss to understand the hallucination which says that the amendment will remove the House further from the people.

(2.) If an important change of public opinion should come over the country, say in two months after an election, it will be about *three years*, under the existing system, before the people can replace the recently elected House of Representatives. Under the proposed system *they could replace one-half of them in eleven months.* Constituted as the American Congressman is, we know that a decided expression of public opinion at these annual elections will be just as potent on the men who are not then elected as on the men who are; in fact, with an election before him "next year," a Congressman will be much more sensitive to public opinion than if he had just gained his seat. We can, indeed, conceive of no possible method for bringing the House of Representatives nearer to the people and making it more sensitive to the public will than that proposed.

(3.) Under the present system all the members of the House hold their seats through half of their operative official life (*i. e.*, through the most important session of Congress) after their successors have been elected, and when nearly two years must expire before another election can be held. Under the proposed system *no member will occupy his seat after his successor has been elected*, and the monstrous absurdity and abuse of the present system will disappear.

(4.) Under the present system, no matter what the public exigency, no matter what the condition of the legislative business, a law more unalterable than that of the Medes and Persians compels the dissolution of Congress in each alternate year at a fixed day and hour. The inevitable and gross abuses of the system are too well known to need repeating. Under the proposed system that arbitrary dissolution will disappear, the termination of the one session will be as manageable as the termination of the other, and *Congress will have no excuse for doing its work hastily or adjourning before its work is done.*

(5.) The present system, bringing dissolution as frequently as it does, involves the most astounding waste of everything that should be economized in the legislative system. Not only does Congress expire, but everything which it has labored upon, if not actually completed, expires with it. As we now go to press, the House of Representatives is still unorganized, and the single individual who forms the committees and who may, if he pleases, dictate the policy of the House, has not yet completed his selection. Under the proposed system, *the House will be organized from the hour when the Speaker is elected;* a working body equipped for work, and ready for work, and able on the second or third day of the session to take up the work of the nation precisely where the preceding Congress left off.

Let us now turn to the things which the proposed amendment will not do:

(1.) It will not retain the present vicious system of the short session.

(2.) It will not keep members in office after their successors have been elected.

(3.) It will not retain the arbitrary destruction of the legislative organization in each alternate year.

(4.) It will not bring together a large, unorganized mass of new members within a month, or two months, of their election (as proposed by the Crain amendment), with the heat of the election still upon them, and all the dangers of disorganization before them.

(5.) While it will make public sentiment felt annually, and almost instantly in Congress, it will not go to the dangerous extreme of enabling some temporary public excitement to overpower the national legislature.

With these facts plainly in view, we ask every thoughtful person to remember that while everything in our country has grown greater —its territory, its population, its intelligence —the product of our national legislation has not improved, and, indeed, has so deteriorated that the work of the last Congress is not comparable with the work of the first ; and then to ponder the following question : What would be thought of a great railroad corporation that in each alternate year, on the 4th of March, at the hour of noon, stopped all of its trains wherever they might chance to be, in the midst of a prairie or crossing a bridge; blew the water out of the boilers, put out the fires, invited the passengers to get out and walk, unloaded the freight, burned the tickets, blanks, and forms, cancelled their contracts, recalled their advertisements, and then took a long breath and began again? And what would be thought of a company that kept on doing this for no better reason than that they feared, if they did not, the brakemen might be a continuing body, and some day run away with the trains?

A plan to change the administrative methods of government will frequently attract no attention whatever, sometimes will arouse warm opposition, occasionally will receive decided approval. The Constitutional Amendment to change inauguration day from the 4th of March to the 30th of April was of the last class. Its merits were instantly perceived; the bar and the bench recognized the practical advantages which would accrue to legislative work; patriotic sentiment felt it to be a graceful commemoration of the one hundredth anniversary of Washington's inauguration: the press advocated it, and the militia sent in petitions asking for its adoption. But the Constitutional Amendment to reform the House of Representatives which we have propounded, has been remarkable in being received in none of these ways. Probably no other ever caused at the same moment and in the same persons so much commendation and so much doubt. Thus, in a very fair and intelligent article, wishing the question to be discussed and settled, the Washington *Post* says:

"It will require much argument to convince us that this plan is desirable. It is true that the Senate, being not only a continuing body but indirectly responsible to the people, is so slow of political change that the will of the people, expressed every two years in the election of Representatives, is often nullified by the Senate. But this does not seem to be any reason why the House should be less expressive than it is of prevailing political opinion."

And the Buffalo *Courier*, in a more extended and equally fair article, might be cited to the same purport.

A constitutional scholar who possesses the rare advantage of having lived for many years at the national capital, in familiar and confidential intercourse with the most distinguished statesmen of both parties, without having been in public office himself, and whose name we regretfully withhold at his request, writes :

"I entirely concur with so much of the reasoning of your article as relates to the necessity of modifying the despotic power of the Speaker, and of bringing the meeting of a new Congress into closer contact with each new election for its members. . . . As to the expediency of making the House a permanent body like to the Senate, in this respect I confess that I have some demur. Will not such a reformation tend still more to consolidate the power of the legislative branch of the Government—already stronger than the other branches? Will it not make change in Federal policies and Federal laws still more difficult of attainment? The great vice in the present polity is its ultra-conservatism—the fact that institutional means for effecting political changes do not keep pace with social and economic evolution. Will not the proposed reformation make our polity still more conservative?"

On the other hand, we have seen a private letter from Mr. Robert C. Winthrop, who not only is a veteran statesman, but was for ten years a member of the House of Representatives and repeatedly Speaker of the Massachusetts House, in which he says:

"I had read the article in the *Nation* with great interest, and have now read it again and with renewed satisfaction. I should gladly see the first amendment (relating to the inauguration) pass separately and on its own merits. But the second (relating to the House of Representatives) seems to me a great improvement on our present system. I heartily hope you may succeed in getting both adopted."

In presenting the proposed change to our readers, we depicted, illustratively, the House as it is and the Senate as it is in this matter of organization. The reference to the Senate, though merely an illustration which everybody knew something about, has led some correspondents and critics to suppose that we advocated changing the House into a body precisely like the Senate. No writer has, indeed, gone so far as to say that we desired secret sessions, or meant to reduce the number to seventy-six members; but the misapprehension has stopped short only at those points. We referred to the fact that the President pro tempore of the Senate is changed with every change of party; but the amendment under consideration will extend neither to the Speakership, nor to any matter of detail. Indeed, the term of the presiding officer of the House is not now regulated by

the Constitution. "The House of Representatives shall choose their Speaker," is all that is written concerning the tenure of the office; and, "A Speaker may be removed at the will of the House," says Jefferson's Manual. In other words, the Speaker of to-day holds his office, just as the President pro tempore of the Senate holds his, "at the will of the House."

The end to be kept in view, however, is not the term of the Speaker's office, but his power over and control of the committees. Some thoughtless talk has been indulged in; such as, that in the selection of the Senate committees there is doubtless a friction which the public do not hear and a manipulation which they do not see. Whether there be a friction or not, we neither know nor care—it is a friction which will hurt nobody outside of the Senate Chamber; but concerning the committees of the Senate three things are undeniable: (1) that there is no barter and trade between the presiding officer and persons who wish to control committees; (2) that there is a natural selection of the fittest, whereby the committees are well made for the work they have to do, and the ablest men of the controlling party are at the head; (3) that they are always organized and ready for work, and have their work well in hand. With a continuity of organization in the House, the actual experience of the Senate warrants a belief that the system of natural selection will naturally be adopted. Under the present disjointed system of biennial disorganization and reorganization, the despotic and dangerous power of the Speaker seems inevitable.

It has been said of the Senate that it is further removed from the people than the House. If that means that the Senate is less observant of the public will than the House, it is an error which every year of legislation contradicts. We cannot at the moment recall a single important non-political measure, such as the Presidential Succession Act, the Electoral Count Bill, the National Library measure, in which the Senate has not been years in advance of the House. It must be remembered that the Senate is part of the legislative power, part of the treaty-making power, part of the appointing power. The element of secret sessions, and the "courtesy of the Senate," which this paper has steadfastly opposed and condemned, spring out of the latter powers; but the legislative work of the Senate, considering what slovenly statutory work comes from the House, and the shameful manner in which appropriation bills have been held back, is, as a general rule, well done. Indeed, if there be one legislative body in the world which has been characterized during the last ten or fifteen years by dignity, decorum, freedom, and yet commendable temperateness of debate, and in keeping its own share of the legislative work always in advance of the other house—in short, a body which the intelligent citizens of a civilized country may look upon with reasonable satisfaction—it is the Senate of the United States.

That "continuity of organization" can render dangerous a legislative body half of whose members will go out of office every year is certainly an extraordinary fallacy. The Long Parliament was a usurpation, because for twelve years and more the people of England could hold no election of members. Organization is nothing more than machinery in working order. Dislocating the engine will not lessen the power of the engineer. No nation is ever going to be enslaved by legislators whose term of office is so short-lived as that of our Representatives in Congress. If usurpation comes, it will be the work of the bad and the unprincipled, who can find no instrumentality better fitted for their purpose than an unscrupulous Speaker and an unorganized House. The break between one Congress and another happens now to be an interval of some months, but it is only a few years since Congress was sitting almost continuously. The Thirty-ninth Congress expired on the 4th of March, 1867, and "the first session of the Fortieth Congress was begun, and held in the city of Washington on the 4th day of March, A. D. 1867." The interval of disorganization, the reëlection of the Speaker, Clerk, and other officers, the fresh deal and dicker of committees, did not lessen the power of the dominant party in that House, nor hinder the mad impeachment of the President during the ensuing winter.

In conclusion, we desire to impress upon our readers the simple fact that the constitutional continuity of the House of Representatives means simply continuity of organization; that organization means simply the machinery for doing its proper work; that a new Congress does not mean philosophically or practically the same set of politicians reappearing under a new name, but a new set of members, newly elected, bringing with them a new exposition of the public will; that the proposed amendment will secure two different but desirable results: (1) the unbroken business organization of the House; (2) the annual and immediate appearance of new members whenever they may be needed.

THE BLAIR BILL ONCE MORE.

THE question whether the Federal Government ought to appropriate money from the national Treasury to aid in the support of schools in the States, for the especial benefit of the South, received a thorough discussion while the proposition was before the Forty-ninth Congress. The scheme had been urged for some years before, without ever being subjected to careful scrutiny, and the public had inclined to give it a thoughtless approval. But during the early months of 1886 the facts and figures regarding the actual educational condition of the South, which were presented from time to time in the *Evening Post* and *Nation*, caused former supporters of the project to change their views, and resulted in a popular verdict against the bill, so that its failure to pass Congress was generally welcomed. The completeness of this revolution in public sentiment was shown in the most striking way possible by the action of the New Hampshire Legislature last summer. Mr. Blair appealed to the lawmakers of his own State for a resolution of hearty endorsement to serve as a lever in the Fiftieth Congress. The resolution went to the Committee on National Affairs, two-thirds of whom were Republicans, but by a vote of nine to two the Committee reported "inexpedient to legislate," and the greatest efforts of Mr. Blair's friends were required to save him from the humiliation of an adverse majority in the Legislature—a cold "approval" being finally granted, only by a vote of 136 to 127.

As the New Hampshire Senator insists upon being beaten again, it is well to restate the considerations which were urged against his bill two years ago, and to reinforce them with the new objections which have developed in the meantime. The plea for the measure is based upon the statistics of illiteracy furnished by the census of 1880, which showed that in a number of the Southern States nearly or quite half of the voters were unable to read and write. This fact is always presented by advocates of the bill as conclusive evidence that the South must have help from Washington; but, properly understood, it bears a very different aspect. While it is true that in 1880 there were in the South 4,715,395 persons over ten years of age who could not write, 2,961,371, or about two-thirds of the whole number, were men and women over twenty-one years old, who would never go to school if they had a chance. In other words, by far the greater part of the illiteracy which existed in the South in 1880 was hopeless, because by far the greater part of the illiterates were too old to attend school. It is absurd to say that the South in 1888 needs Federal aid to educate her children because in 1880 there were three million grown-up illiterates, born either slaves or "poor whites" of the slavery era.

The vital question is, whether the South is now herself educating her children so that they will not be illiterates when they grow up. Advocates of the Blair bill always insist that it is not, because the South does not have as good schools as cities in the North have. We have heretofore pointed out that the proper comparison is with thinly settled agricultural States, like Maine, New Hampshire, and Vermont, and have shown that illiteracy has been avoided in these New England States by a school system no better than that which many Southern States already have, and which the others will soon have at their present rate of progress. It was a great surprise to Northern people when we demonstrated that a number of Southern States keep their children in school more days in the year than New Hampshire does hers, but the truth is at last accepted even by New Hampshire, and the Concord *Monitor*, which is generally known as the "organ" of Mr. Blair's colleague, Senator Chandler, last April told its readers that "New Hampshire has less schooling than Delaware, Maryland, Virginia, West Virginia, or Missouri"—to which it should have added Texas and Kentucky, while Florida and two or three others are within a few days of the New Hampshire average. In like manner the *Monitor* might have shown that a larger percentage of the children of school age are en-

rolled in the public schools of some Southern States than in New Hampshire, while even South Carolina, which has the largest proportion of negroes, falls only a trifle behind New Hampshire in this respect.

The latest reports of the Superintendents of Education in the Southern States teem with proofs that outside help is not needed, a few of which must be cited. The average length of the school year in Virginia is already nearly six months, and the Superintendent recommends as perfectly practicable a further extension through the increase of local assessments. In West Virginia the average length is nearly five months, and the Superintendent urges an increase, remarking that "the additional tax for two months would scarcely be felt." In Tennessee the Superintendent reported that "our public-school system is growing in favor with the people," and the Legislature justified his statement by more than doubling the school tax within a month after the Blair bill lapsed by the expiration of the Forty-ninth Congress, while the counties in their turn are doubling the local fund raised for education. In Alabama the Superintendent recites the growth of the system within four years from 4,624 schools with 177,428 pupils and a school fund of $392,904, to 5,595 schools with 252,967 pupils and a school fund of $523,353; he says that "our educational facilities must be increased to keep abreast with the material prosperity of the State," and adds that "all know there has been a gratifying increase in the resources of the State during the past few years which requires an increase in the annual appropriation for schools." In Arkansas the Superintendent reports that "we are making rapid progress in our educational interests, and in a few more years Arkansas will stand side by side with the most favored of her sister States in the educational advantages she offers to her children"—a statement which is certainly warranted by the increase between 1883 and 1886 from 2,462 teachers, 112,233 pupils, and $479,471 expenditure, to 3,691 teachers, 175,935 pupils, and $866,892 expenditure. In Georgia the Superintendent reported an increase within four years of pupils from 244,197 to 309,594, and of expenditure from $498,533 to $723,161, while he showed once more that a small increase in the tax, which could be laid "without unduly burdening the people," would enable the State to keep the schools in operation for six months of the year. In Florida the Superintendent reports that the amount expended upon schools has risen within four years from $133,260 to $400,000, while the school year falls only a few days short of New Hampshire and Maine. In Texas the Superintendent reports a steady and rapid advance in the cause of popular education, and insists that "the school term throughout the State should not be less than seven months."

Space will not permit a full presentation for each State of the wonderful progress which has been made in developing the school system of the South within the past few years. The Blair bill was introduced in December, 1881, upon the ground that the South was so "impoverished by the war" that it could not raise any more money for schools than it was then raising, and that Federal aid ought to be granted for eight years. Six of the eight years have passed; the amount raised for schools has been largely increased in every State, and doubled or trebled in some, while the man who should now talk about the South being "impoverished by the war" would provoke the derision of every self-respecting Southerner. The rigorous test of time has been applied to the plausible pleas which were originally made for the passage of this bill, and their fallacy has been clearly exposed. The South has shown herself able to overcome the difficulties of the situation, and her success is another tribute to American self-reliance. The most satisfactory feature of the matter is the fact that the opposition which has defeated the "Bill to Promote Mendicancy" was largely the opposition of self-respecting Southern men, like Senator Butler of South Carolina, who put the case against it most forcibly four years ago, when he said:

"We ought to pause and reflect, for fear that in throwing this large amount of money into the States you will check the effort in those States to develop their own common-school system in their own way. Why, Mr. President, there is no success in life comparable to the success which attends individual effort, none so enduring, none so satisfactory. I would, therefore, be very cautious before I would appropriate money and put it with the States, the effect of which, I am afraid, would be, among others, to induce a very great many men who are now earnestly struggling to build up their own local institutions, to put their hands in their pockets and say: 'The general Government is going to educate everybody—what is the use of any man paying taxes for education?'"

PICTURES AND PICTURE-BUYERS.

A CORRESPONDENT in the West writes, on behalf of some local economists who are just now occupied with the tariff discussion, to ask us whether we set paintings down among the things known as "luxuries," and therefore a fair subject for Custom-house taxation. The question will most probably come up this winter in connection with the 30 per cent. duty which we now levy on the works of foreign artists, and which we believe nobody any longer defends on the ground that it is legitimate protection for native industry against foreign competition. Thirty years ago there were American artists who dreamed of the possibility of making by the aid of the tariff a sort of art vacuum in this country which native talent would fill with a purely and distinctively American school, owing nothing whatever to European precept, spirit, or example. But this dream has for the most part passed away, and American artists have resigned themselves to taking part in the general struggle for distinction and a market without any adventitious aid.

If any are now disposed to rely on the tariff at all, it is rather for protection against the dealers in this country than against professional rivals abroad. They say, and with a good deal of force, that in no country is the dealer so powerful an influence in the picture market as in this, because in none are there so many buyers with long purses who do not venture to rely on their own judgment in making their purchases. When the time comes in their career, therefore, at which they think it is incumbent on them to fill their houses with works of art, they put themselves unhesitatingly into the hands of an importer, and he generally covers their walls with the products of foreign studios, and, if he allows them to buy American pictures at all, recommends them only for bedrooms and the less frequented parts of the house.

Against this discrimination the human nature in American art naturally revolts, and if the tariff would do anything towards repressing it, we imagine a good many advocates for the duty on foreign pictures would be found among American painters. But as a matter of fact the duty on foreign pictures, although it may in some degree prevent importations being as large as they would be in its absence, has not perceptibly diminished them. The ebb and flow of the American demand for European pictures seems to be more affected by the condition of the stock market than by any other influence known to us. In truth, the ordinary American picture-buyer is rather stimulated than deterred by dearness. The addition of 30 per cent. to the price is in nine cases out of ten more likely to increase than to cool his ardor. In his own ignorance of the conditions which fix the value of a picture in money, he is apt to defer to the judgment of those who profess to know something about them, and to conclude that their asking a very high price is a sort of confession of the importance of what they have to sell. He does not know, what is literally true, that the picture market now closely resembles the stock market—that it has its bulls and bears and corners, just as Wall Street has, and that dealers not infrequently "sell short" works which they know are held in considerable quantity by a rival, in order to break him down, or "make corners" in works which they know he is seeking, and unload freely on "lambs" from the West works in which their own expectations have been disappointed.

So that, on the whole, the effect of the tariff on the sale of foreign pictures, though doubtless considerable, can hardly be said to be perceptible. It keeps foreign pictures out to some extent, but we do not know to what extent. The only aid in approximating to an estimate of it is to be found in the large number of counterfeits of distinguished European artists which are to be found all over the country. A French connoisseur came here a few years ago to catalogue, if possible, the more valuable works of French art to be found in this country in private collections and public galleries. He had not gone very far, however, before he came on forgeries, enough to astonish him, of the more readily imitable works of such painters as Corot and Rousseau. In fact, we have ourselves been assured by a leading American painter that there is in one of the suburbs of New York a Corot factory, from which you can obtain works of this master of any size or in any quantity you please—either by the dozen or the single copy. That the

tariff fosters frauds of this sort is very certain. The smuggler and counterfeiter always follow close behind the custom-house inspector.

The objection to the picture duty which American artists, we imagine, feel most keenly, is the discredit it inflicts on us in the eyes of foreign nations, which contain a large proportion of the public whose opinions they value. We are the first civilized country which has ever sought to make difficult the importation of works of art. All the leading governments of Christendom spend money in buying pictures for public galleries, and encourage by every means in their power the introduction of them from abroad by private individuals, both for their own greater glory and for the cultivation of the popular taste in an important field of human expression. We enjoy the amazing distinction of being the only people to put pictures on a level with cotton goods, and pig iron, and raw wool. Every American who occupies himself either with literature or art or science, or with the cultivation of the ideal in any field of human observation, is, of course, compelled to hang his head for shame when he is asked to explain this to a foreigner. But the reason why he hangs his head for shame in talking to the foreigner is also the reason why he is puzzled and embarrassed when he is called on to explain to the ordinary Congressman why taxes on works of art are all wrong. He cannot make the Congressman understand the part which art plays in the higher development of the race any more than he can make the foreigner understand the Congressman's indifference to it. If a man sees no educational value in art, one can hardly reveal it to him by any sort of exposition. It is, like color-blindness or the absence of ear for music, a difficulty which can only be overcome by faith. That is to say, people who see nothing in pictures, whether old or new, must trust that immense body of the best men and women of all ages who have treated art as "the flower of humanity."

The accumulation of first-rate pictures in America, in spite of all difficulties, is very rapid. They are, it is true, luxuries, in the sense that only rich men can buy them. But they are luxuries which rich men cannot consume, which delight the eye and cultivate the taste and imagination of millions who could not afford to buy them, and in a vast number of cases they find their way in the long run into public galleries and become to all intents and purposes the property of the people. We can hardly check this tendency by any import duty, however heavy. The money the present duty brings in is a mere bagatelle, so that in levying it we accomplish little beyond making our legislation seem barbarous.

THE CHACE COPYRIGHT BILL.

Senator Chace of Rhode Island has again presented to the Senate his International Copyright Bill, with no change in the text except that the date in the enacting clause is set forward one year to July 1, 1888. We have before summarized the provisions of this bill, and now desire only to revert to the clause which prohibits the importation of any foreign edition of a book reprinted in the United States. Although the two measures proposed to secure copyright to British authors which, for the moment, are attracting the largest share of public attention, both originate in Philadelphia, they are diametrically opposed in one respect. While Mr. Smith's proposed bill is designed to give the utmost latitude to competing editions, upon the plea that in this way the lowest price will be secured to the reader, the effect of the prohibition-of-importation clause in Mr. Chace's bill is absolutely to remove competition. Should this latter bill, as it is now worded, become law, American readers may find themselves obliged to choose either to go without the book, or to pay for the American reprint of Tennyson's next poem double or treble the price of the original English edition. This is no fancy illustration. Whenever an English author of established popularity shall announce a new work, American publishers will hasten to compete for the privilege of issuing it in America, and the bidder offering the highest price to the author will, of course, secure the right to republish. Having thus obtained the entire American market for his edition, with the absolute prohibition of importation enacted in the bill barring out any and every competing foreign edition, the acute publisher will very naturally hasten to recoup himself for his outlay by demanding from American readers the highest obtainable price for the work thus secured.

This is so plainly the practical result of the legislation proposed that it is with considerable curiosity one turns to see what the projectors and defenders of this bill have to say in defence of this stipulation. The arguments made are threefold: (1) That it is "an invariable rule in all countries where copyright exists"; (2) that it is necessary to enforce the requirement of the American manufacture of each book copyrighted; and (3) that the "apparently harmless concession" of an importation of copies of the authorized English edition by the author or copyright proprietor "would overthrow the whole design and purport of the bill."

Concerning number one, we have before pointed out at some length that so far is it from being the "invariable rule in all countries" to prohibit the importing of the *authorized* original edition, that it is entirely without precedent in the copyright legislation of any and all countries; only *surreptitious* reprints are thus prohibited. As regards the second reason advanced, section two of the bill distinctly requires that, in order for the foreign author to secure any copyright at all in this country, he must, within three months after recording the title of his book, deposit with the Librarian of Congress "two copies of the best edition of the same *printed in the United States*"; and if he does not, he remains in exactly the same position as regards an American copyright, after the enactment of the proposed law, as that which he now occupies. It is, therefore, but a transparent pretence to claim that the prohibition clause is necessary to secure American manufacture. At number three, however, we arrive at the true reason for the insertion of this clause. Instead of being, according to reason number one, simply an article usual in all similar legislation, we discover from Mr. Henry C. Lea's words, quoted above, that the enactment of this article is necessary to secure the real purpose of the entire bill.

Mr. Chace states in his report that the present tariff on books of 25 per cent., added to what is repeatedly referred to by Mr. Lea and himself as the high price of the original editions, would not afford sufficient "protection" to the American manufacturers engaged in the production of books. In other words, the importation of the "expensive original editions," even with the addition of a duty of one-quarter of the English price, would produce a competition detrimental to the interests of the American republishers. It is necessary, therefore, to enact a law which will allow the American reprinter unhindered opportunity to add as much per cent. to the English price as will enable him to meet the additional cost of manufacturing the book in this country (which, according to Mr. Chace, "just about balances the amount of duties imposed"), and, in addition, secure to himself a handsome profit. And this is very evidently "the whole design and purport of the bill," which would, as Mr. Lea says, be thwarted were the prohibition-of-import clause removed. As the interests of the English author and the American reprinter are identical, so far as obtaining the highest possible price for the reprinted book is concerned, it is easy to agree with Mr. Chace that they "will both be protected," but it is by no means so easy to "perceive that the interests of the American reader will suffer no detriment" by giving the first two parties an absolute protection from competition.

During the copyright agitation of 1871-72 the publishers and others of Philadelphia held a meeting in January of the latter year, at which Mr. Henry Carey Baird presided and Mr. Henry C. Lea was present. Fearing that the Copyright Bill requiring American manufacture which was then urged upon Congress might become a law, a resolution opposing it was passed upon the ground that its enactment would "enable the foreign author and his assignee in this country, by an absolute monopoly in the production, to fix the price of his book without fear of competition." At that time, it should be borne in mind, there was no question of giving the reprinter such absolute monopoly as would result from cutting off the competition of the imported edition, and the remonstrance Mr. Lea then sanctioned would, therefore, apply with much greater force to the bill he now urgently advocates. A further resolution, however, setting out that this obnoxious monopoly would fall into the hands of the "great capitalists of the Atlantic seaboard," *i. e.*, the publishers of New York and Boston, gives rise to the conjecture that it was this possible danger to Philadelphia reprinters which was the real grievance.

PROTECTION TO LIQUOR-DEALING.

THE Excise Board presents both a majority and minority report to Mayor Hewitt, in making suggestions, in compliance with his request, for changes in the law. The majority, Messrs. Andrews and Von Glahn, are opposed to high license and in favor of licensing houses instead of persons, and of issuing licenses to "keep open all night to liquor-dealers in certain portions of the city, in the restaurants, hotels, and drinking places about the markets, at the ferries, railway stations, about the printing-offices, and at certain points on the main thoroughfares." They would also license certain places to keep open on Sunday during specified hours, for the accommodation of that large portion of the community who take beer or wine as part of their daily diet. On the number of drinking places they would place no restriction whatever, and as they would only charge a "moderate fee" for the privilege of carrying on the business in any particular house, and as they admit that "the rental value of places licensed is greater for that than for any other business as a rule," they must contemplate an indefinite expansion and cultivation of the business by all property-holders desirous of securing an unusually high rent for their premises.

Mr. Woodman, the minority, on the other hand, would restrict the number of licenses granted to one to 500 of population, which would cut down the number of drinking places now existing in New York from 8,000 to 3,000, and would make the license fee very high, and add imprisonment to the fine for violations of the law, and would in all cases compel the landlord of the premises on which liquor-dealing was carried on to go on the applicant's bond, if he were not himself the applicant. Both reports are worth careful reading as the expression of the two great divisions of public sentiment about the liquor business. Mr. Woodman represents those who think that

"the Excise Law was not made, and should not be administered, in the interest of the liquor-seller. It was made not to promote, but to restrict the traffic; not to protect the seller in his business, but to protect the public against the inevitable evil results of that trade. So inevitable and so evil are these results that the tendency of public opinion and of excise legislation in all civilized countries for many years past has been towards severer curtailment and control of the liquor traffic. In several States of our Union it has culminated, through popular vote, in absolute prohibition.

"Every new step, therefore, should be towards further restriction and repression. The saloon, as it has developed in this city, is a gigantic evil in the vastness of its proportions and in the character it too often bears. It is sapping the strength and endangering the safety of the commonwealth. I believe it to be in the highest degree unwise to do anything to enlarge its scope or strengthen its grip upon the community."

Messrs. Andrews and Von Glahn are not equally explicit in stating what their attitude towards the liquor traffic is, but it comes out clearly enough incidentally through their recommendations. They evidently consider it a source of comfort and convenience to a large body of the population, liable to abuse certainly, and therefore to be regulated, but in no way to be discouraged or frowned upon. Obstacles are not to be opposed to the business. The conduct of it is to be made safe and convenient; the license is to be transmissible to heirs and executors; the applicant is not to be required to reside in the county in which he sells liquor; licenses are to be issued for short terms for special occasions; connection with theatres and places of amusement is to be permitted; there are to be no prohibited hours or days for *all* drinking places. In fact, the only condition worth mention which they would attach to permission to carry on a liquor store, is the condition which is attached to permission to carry on a bakery or dairy lunch-room in all civilized communities—that is, abstinence from disorder and indecency. For, most assuredly, if it appeared that bakeries or dairy lunch-rooms were the favorite resort of bad characters of both sexes, and noted for the number of fights and murders which occurred in them, and for the number of persons who issued forth from them to commit assaults in the streets, or go home to "pound" their wives and smash their own furniture, bakers and milk-dealers would be carefully licensed and looked after by the police.

Now, whatever be the merit of this assumption of Messrs. Andrews and Von Glahn, it is certainly not the one which now commands general acceptance, or on which the bulk of this community will any longer allow liquor legislation to be based. Whatever change is made in the law in this State must be, and we believe will be, made in the direction indicated by Mr. Woodman. In other words, public opinion demands, all over the country, with increasing force, that since liquor-dealing cannot be abolished, it must be discredited; that entrance to it must be made difficult; that the number of those engaged in it must be restricted; that liquor-dealers must, by hook or by crook, be ousted from their present influence in our politics; that all regulation of the traffic must openly recognize and provide for the fact that it is by far the most fruitful source of crime and disease and poverty known to the modern world. There is not a civilized country to-day which is not dealing with this problem on these lines. All thoughtful men are everywhere seeking to make liquor-dealing an uncomfortable and disreputable calling. This tendency may be temporarily baffled here and there, but its triumph is certain in the near future, and no flummery about "reputable persons conducting an orderly place in a moderate way," or about "honest, thrifty, law-abiding" drinkers, will arrest its progress.

MUTATIONS OF THE BOOK TRADE IN GERMANY.

THE decadence of the book trade, outside of our largest cities, has been much discussed by those immediately interested, but it is to be feared that the reading public fails to perceive that the disappearance of the country book-shop implies a corresponding narrowing of the area of literary culture. In this connection it is interesting to learn (from an article in the *Preussische Jahrbücher* for November) that the same result is threatened in Germany, though the German trade suffers from only one of the evils which afflict the American. These are three in number: first, the dying out of the habit of buying books as part of the furniture, as it were, of the homes of all families of even moderate wealth and cultivation. This is chiefly owing to the enormously increased taste for bric-à-brac, engravings, artistic furnishings, and the like, the gratification of which absorbs the margin of income formerly spent in providing well-bound sets of the Waverley Novels, *Littell's Living Age*, the *Atlantic Monthly*, and the newest volumes of Huxley and Lowell. Want of space forbids our discussing this point in detail, and we therefore refer those interested to Mr. Henry Holt's New Haven address of last year. Another evil is the revolution in values—that is, in the instinctive consciousness of what one ought to pay for a book, caused by the existence of the twenty-cent libraries. The literary democracy which these have established has destroyed the aristocracy of good editions and authors' monopoly, which, apparently, had nothing to support it except custom and tradition.

These two causes would probably have been sufficient to limit the bookseller's stock to "libraries" and a few gift-books for the holidays, and this limitation is fatal to his prosperity, because the margin of profit on the "libraries" and on school-books is very small, while the gift-book season is short, and the danger of being left with damaged or *passé* stock is great. But that which, in the opinion of the trade, is the greatest evil, and the one from which, in a different form, the Germans also suffer, is the underselling, by which a few dealers are able to profit at the expense, and eventual ruin, of the majority. This is the "bazaar" nuisance, the system under which publishers sell quantities of their most salable books, at the same or greater discount, to the miscellaneous shops modelled on the Bonne Marché or the "Universal Provider," one, at least, of which is now to be found in every considerable town, and which use books, along with dentifrices and soaps, as decoys to entice buyers of their other wares. Nor is the influence of these shops confined to their immediate neighborhood, for some of them do a large business by post.

The same thing, it appears, is going on in Germany, and is ruining that particular feature of the German book-trade which, according to our *Jahrbücher* friend, is the envy of foreigners, and which has undoubtedly, as he says, largely helped to make Germany the country in which learning is geographically most widely distributed. By means of it, the scholar who lives in the remotest country town enjoys the same advantages, as regards current literature, as the dweller in the largest city. He has only to give his local bookseller the name of any book which he possibly may find valuable, and by return of post it is on his table. He may keep it several months, and after making any useful extract, return it without compensation for the loan. Two-thirds of the books he receives are thus, at the end of a year, returned to the publisher, and the bookseller makes his living out of the profit on the third book, which is bought. The rural scholar is thus never obliged to buy a pig in a poke—he has ample opportunity to learn, by examination, whether a work is indispensable, and to have the use of the larger number which, though not of permanent value to him, are of great temporary use. Another advantage of the system is that it implies the presence in every little town of a bookseller who is obliged to anticipate, to a large extent, the wants of his circle of customers, and hence to be a man of considerable intelligence, if not a scholar, him-

self, and whose shop, in a small way, is a "literary centre."

But some clever Berlin dealers a few years since conceived the idea of offering publishers to take at one time a large quantity of each book on which they were sure of a large sale, the publishers, in consideration of the large number sold, to give a discount of 40 or 50 instead of the usual 25 or 33 per cent., at which rate they were able to sell the book at about the same price which it cost the small bookseller. By this arrangement publishers and dealers alike profited, but the old-fashioned retailer, of course, came to grief. Two years ago the publishers discovered that this was a short-sighted policy—that their sales through the large dealers in the end were smaller than they had been under the old plan, and 600 of them agreed to have no dealings with firms which dealt on this principle. On September 25, 1887, this boycott was strengthened by a resolution of the Book-dealers' Union hereafter to regard every dealer who gave a discount of more than 5 per cent. as coming under the ban. But though the local bookseller in Germany, thanks to these sharp measures, will die a more lingering death than his American brother, his doom seems to be just as certain.

The resolution of the Union, which we mentioned, has been unfavorably commented upon by the press, and the *Jahrbücher* article is largely a reply to these criticisms. The writer maintains that the prices of serious works are low enough, but admits that those asked for school-books and belles-lettres are too high. In defending these positions, the (anonymous) writer gives some interesting statistics, which, as the *Jahrbücher* is issued by a highly respected firm of printers and publishers, are, we suppose, trustworthy. Incidentally the exports and imports of Germany are compared with those of France, the result of which, in view of their political relations, is highly surprising. In 1885 France imported books, engravings, etc., to the value of $6,400,000, and exported $9,000,000 worth. But taking the trade with Germany by itself, the proportion was reversed, the importation being $3,600,000, the exportation only $765,000. The total German trade for 1886 was—imports $6,000,000, exports $15,530,000.

We get, too, some light on the pecuniary profits of authorship in Germany, though the writer apologizes to his brethren for telling tales out of school. It seems, then, that the cost of putting on the market a strictly scholarly work, of which the number that may be sold will not exceed 500, and assuming the author to be neither unknown nor famous, is: Composition and presswork for an 8vo volume of 320 pages, 500 copies, $175, paper $41.25, *author's compensation*, $125, incidental expenses $33.75; total $375. Moreover, the author of a work of more popular character, which may be expected to sell 1,000 copies, or of a novel which sells 1,500 copies, gets no more for his labor; but the compiler of a school-book which is likely to sell 5,000 copies, gets the fabulous sum of $150! The insignificance of the sums paid the authors of works of scholarship and fiction might be accounted for on the ground that so many works of these classes are published with a view to benefit the author's reputation rather than his pocket; but compilers of school-books do not usually work for "glory."

THE YELLOWSTONE PARK AS A FOREST RESERVATION.

WASHINGTON, January 2, 1888.

Of the varied beauties of the Yellowstone Park much has been said in praise. The splendor of the Grand Cañon, the grandeur of the Lake and of those scientific curiosities, the geysers and hot springs, have been described over and over again until every one is more or less familiar with the natural marvels of this wonderland. Now that the once famous pink and white terraces on the shores of Rotomahana in New Zealand have ceased to exist, the similar deposits in the Yellowstone Park stand unrivalled. Notwithstanding all that has been written, based upon sentimental considerations, in favor of a maintenance of the Park by the general Government, the most forcible argument for its preservation is an economic one far outweighing all others in importance. It is one which has received but slight attention outside of a narrow circle of the friends of the Park who realize the true value of the region.

The object of first importance in maintaining the Park is the preservation of its forests. Forest preservation is rightfully attracting increased attention in all parts of the country, and it is now very generally admitted that a rigid enforcement of the proper restrictions in the cutting of timber is demanded for the public welfare. Owing to the many conflicting interests in the more settled communities, additional protection by legislation is by no means a simple problem. Nowhere is this better shown than in the struggle in New York State to preserve the timber of the Adirondacks against the encroachment of lumbermen.

The Park is a natural reservoir admirably adapted by its topographical structure for the storage of water. No region of equal area in the heart of the Rocky Mountains presents so many favorable conditions for receiving, storing, and distributing a liberal water supply. For the preservation of this water the dense forest which covers this region is of incalculable value. The central portion of the Park is a broad, elevated volcanic plateau between 7,000 and 8,500 feet above sea level, with an average elevation of about 8,000 feet; it is accidented by broad depressed basins and scored by deep gorges and narrow valleys. Surrounding it on the south, east, north, and northwest, are high peaks and mountain ridges rising from 2,000 to 4,000 feet above the general level of the enclosed table-land. Across this plateau from the southeast to the northwest, with a very sinuous course, runs the Continental divide, separating the waters of the Atlantic from those of the Pacific. Several large bodies of water, notably Yellowstone, Shoshone, Lewis, and Heart Lakes, form such characteristic features on both sides of this divide, that the country has deservedly received the appellation of the Lake region of the Park. Hundreds of smaller lakes occupy irregular depressions either in the lava flows or in shallow basins of glacial origin high up in the neighboring mountains. Scattered over the plateau, in striking contrast with the greater part of the Rocky Mountains, occur numerous ponds, marshes, and meadows, which hold very considerable amounts of water throughout the greater part of the year. More than 3,500 thermal springs bring up their waters from below to swell the surface flows, while innumerable cold springs coming out from beneath the rocks add their share to swell the current.

Careful observation of plateau, mountain, and valley shows that about 84 per cent. of the Park region is forest-clad. The bare portions of the Park are mainly areas above the timber line, steep mountain slopes, and wet marshy bottoms. The forest is essentially coniferous. A few groves of aspen (*Populus tremuloides*) add brilliancy to the autumnal foliage, but are so insignificant that from an economic point of view they may be discarded. Quite two-thirds of the trees are what are known as black pine (*Pinus Murrayana*), and one may travel for miles over the gravelly ridges of the plateau without encountering any other species. On moist ground at high elevations, and where the snows lie later in the season, this species gradually gives way to the balsam (*Abies subalpina*) and the spruce (*Pinus Engelmanni*). Over large areas, of course, the three species occur more or less mingled. In a few favored localities the statelier tree, the red fir (*Pseudotsuga Douglassi*), is conspicuous by its size and vigor. The black pine rarely attains any great size, trees more than two feet in diameter being exceptional, while over considerable areas they are so diminutive as to be locally known as "lodge-pole" pine. The young forest is generally made up of shapely, graceful trees, but the maturer growth is not specially attractive. The charm of the forest is found in the natural groupings and park-like character of the trees in the more open country, many of those on the mountain slopes being of exquisite beauty. For grandeur and imposing appearance they are not, however, to be compared with those of the Sierra Nevada or Cascade Ranges.

Precipitation of moisture throughout the arid region of the Far West is governed in part by mountain mass and in part by the great altitude of single ridges. Across the Park plateau and the Absaroka Range to the eastward the country is unsurpassed in average elevation by any area of equal extent, and is so situated as to form one of the storm-centres of the northern Rocky Mountains. The moisture-laden winds coming up from the southwest precipitate rain and snow upon the plateau and the western slope of the Absaroka Range, innumerable streams bringing the water from the mountains back into the Park. In consequence, the climate of the region is exceptional, the amount of snow and rainfall being higher and the mean annual temperature lower than over the adjacent country. Unlike the greater part of the Rocky Mountains, heavy rains occur frequently through the summer, and snow-storms are of common occurrence any time between September and May, the snows lying upon the ground well into midsummer. The region is one of the nation's grandest reservoirs, sending its waters thousands of miles to both oceans. A closer examination of this water-supply shows its preservation to be a question of vast economic interest. Two rivers, the Yellowstone and Snake, carry off the greater part of these waters; the former draining more than one-half the area of the Park, and the latter the entire western side of the divide. Yellowstone Lake, the great reservoir for the river which gives its name to the Park, is a body of water of great beauty, measuring twenty miles in length, with a breadth across its greatest expanse of fifteen miles. It has a very irregular outline, with an indented shore of nearly one hundred miles, and an area of one hundred and twenty-one square miles. Not only is the Yellowstone by many times the largest lake in North America at so high an elevation above sea level (7,741 feet), but it ranks among the first in the world at high altitudes. Upon the western side of the divide, less than six miles from the Yellowstone, and separated from it by a ridge not more than two hundred feet in height, lie Shoshone and Lewis Lakes; the former with an area of twelve square miles, and the latter four and one-half square miles. Heart Lake, at the eastern base of Mt. Sheridan, measures three square miles. These reservoirs pour their waters into the Snake, which also finds its source near the southeast corner of the Park.

In the autumn of 1886, with a view of obtaining some data upon the amount of discharge, the largest bodies of water were accurately measured. Not only was the time selected the dryest period of the year, but all lakes and streams stood at a lower level than at any time during the previous five years. Yellowstone Lake stood twenty inches below the high-water mark of early summer. The measurements may be said, therefore, to have been taken at the minimum discharge. Measured just below the outlet of the lake, the discharge of the Yellowstone River was found to be 1,525 cubic feet per second, or, in other words, 34,000,000 imperial gallons per hour. The outflows from Shoshone, Lewis, and Heart Lakes combined yielded 104 cubic feet per second. The Lamar, Firehole, Gibbon, and Madison Rivers were gauged, and careful estimates made of the Gallatin and Falls Rivers, based upon the size and flow of the streams and the area of the country drained. According to estimates of Dr. William Hallock of the United States Geological Survey, who kindly undertook the gauging of the streams, it was found that the minimum discharge was equal to one cubic foot per second per square mile over an area somewhat more than 4,000 square miles, and that the amount of water running into the Park and leaving it through the five main drainage channels would make a river five feet deep and one hundred and ninety feet wide, with a current of three miles per hour. While this may not indicate a large supply as compared with certain highly favored areas, yet it is for the arid region of the West an exceptional and excessive amount.

In an arid and sparsely timbered country and one of unequally distributed rainfall, forests and moisture maintain reciprocal relations. Experience has shown in Europe, and unfortunately already in America, the injurious effect of disafforesting a country near the headwaters of large rivers. One instance will suffice to illustrate this protecting influence of the forest. The report of the recent Forestry Commission of the State of New York says, speaking of the sources of the Hudson River, "that the summer flow of the Adirondack rivers has decreased within the memory of men now living from 30 to 50 per cent. Many of the small streams which a quarter of a century ago were abundantly supplied with water during the entire summer are now dry during many months."

Remove the forests from the sources of the Yellowstone and Snake, and the region would become a barren waste. The snows, under the scorching rays of the sun, would rapidly disappear, and early spring freshets and floods, carrying devastation before them, would strip the rocks bare of the meagre soil with which they are now covered. Under the influence of the forests the soil and vegetation are protected, which in turn act as a sponge, regulating the flow and slowly supplying the springs and streams. The climatic benefits derived from this forest-protected region can scarcely be overestimated. From the cool, wet surface of this broad storehouse of water, the dry winds coming from the West absorb immense quantities of moisture, which is again precipitated over the agricultural and grazing lands to the eastward. Not only should the present reservation be carefully guarded, but the area of the Park should be enlarged to the east and south, so as to take in a dense forest region useless for agricultural purposes and destitute of mining resources. It embraces a rough and mountainous country abounding in streams, the real sources and feeders of Snake River, Yellowstone River and Lake.

The proposed increase extends the boundaries twenty-five miles to the eastward and nine miles to the southward of the present ill-defined limits, which were established at a time when the region had been but little explored. By this enlargement, not only the entire western slope of the Absaroka Range, with its mountain torrents flowing into the Park, but the timber-lands near the heads of streams which run eastward (the waters of which drain into the Big Horn, an affluent to the Yellowstone), will fall within the protected area. To the southward, on the opposite side of the Continental divide, the country, although less rugged, is equally well supplied with streams, springs, and lakes, whose waters uniting make a broad deep river of the Snake before it fairly leaves the mountains for the plain below.

A proposition looking to the enlargement of the National Park has already been brought before the present Congress by Senator Vest of Missouri. No obstacles exist to-day against for ever setting apart this additional territory adjacent to the Park. If left alone, it will soon be invaded by the lumberman, charcoal-burner, and railway-tie cutter, the advance guard of a rapidly increasing population. The preservation of the Park is a necessity to the nation, but to no part of it more than to the Territories of Dakota, Montana, and Wyoming.

ARNOLD HAGUE.

CHAMBER AND PRESIDENT IN FRANCE.

PARIS, December 13, 1887.

THE third French Republic has already had four Presidents. The first three retired voluntarily before the end of their terms. M. Thiers resigned his power, in a moment of anger, in the hope that the Constituent Assembly would recall him immediately. Marshal MacMahon was protected by the constitutional laws enacted soon after his accession to office; he was irresponsible, and could play the part of a constitutional king. But when he dissolved the Chamber, with the consent of the Senate, in accordance with these new constitutional laws, the general elections were hostile to his Cabinet. He remained, however, a little longer in power, with M. Dufaure as Prime Minister; he might have remained to the end of his term if he had been willing to play exactly the part which is played in constitutional monarchies by the sovereigns, since the Constitution under which we live places the Presidential power above all parties. The Marshal could not persuade himself to obey in everything the dictation of his Ministers; he revolted when he was asked to exclude from active service in the army some of his old friends and comrades. The soldier was stronger in him than the President; he resigned, and M. Grévy was elected in his place. The new Constitution was this time put fairly on its trial. M. Grévy affected to take no part whatever in the politics of the day; he uttered no opinions, he seemed to have no opinion; he merely watched the Chamber of Deputies, and gave the power of forming a Cabinet to whoever could dispose momentarily of the majority of the Chambers. The struggle for power became very fierce, and the Cabinets were very short-lived. Every man was tried in his turn; the President seemed to live in a higher sphere. His retired life, his solitude, helped to surround him with a certain halo. He was thought to be a safe, prudent, shrewd man, who could use men at his will, who remained calm amid the conflict of passions, and he was especially credited for his adherence to a policy of peace, though he allowed the expeditions of Tunis and of Tonquin to take place. At the end of his first term, he expressed a desire to be reëlected, and this desire was immediately obeyed by the Chambers, though he was becoming old, and there were already some men anxious to obtain his inheritance.

When M. Grévy was reëlected, nobody could have the slightest doubt that he would quietly end his second term, if he lived long enough. But fate had decided otherwise. I will not enter here into a painful analysis of the incidents which determined him to resign and to abandon an office which he might have kept five years longer. I will only examine the question from a constitutional point of view. The term "Presidential crisis" has been often pronounced in France in the past two months, and nobody seems to have felt its impropriety very much. People have used it as naturally as they do the term ministerial crisis. A change of Ministers seems as natural an incident as a change of weather; a change of Presidents ought to be quite another thing. According to the Constitution, or rather to our constitutional laws (for we have, properly speaking, no Constitution), the President can only be removed from his office in case he commits acts which go under the name of high treason. There is nothing in the constitutional laws which gives the Chamber of Deputies the means to remove the President from the Presidential chair; but what have we seen in the case of M. Grévy? We have seen what can only be called a ministerial strike. M. Grévy offered the Premiership to one after another of the public men who are in the Chamber of Deputies, after this Chamber had upset the Rouvier Cabinet; one after another, these public men refused to undertake the formation of a new Cabinet. The Chamber of Deputies openly, distinctly, refused to give Ministers to the President.

There remained the Senate. Unable to govern with the Chamber, M. Grévy could go to the Senate, and as the constitutional laws do not give him personally the right of dissolution, he could ask the Senate to come to his help and grant him the permission to dissolve a Chamber of Deputies which refused him the means of governing. An appeal to the people, in such a case, seemed the proper remedy, and the only remedy. M. Grévy did not send a message to the Senate, and he made a mistake in not doing so, as, in such a crisis, everything must be made public. He contented himself with conversing with the President of the Senate and with some of his friends. The Senate, which is haunted with the memory of the 16th of May (when a dissolution was granted to Marshal MacMahon), which is also afraid of the Chamber of Deputies, and anxious to prolong its own existence, which at times is threatened by the Radical party, did not in this case defend its own prerogative and the prerogative of the President. There was hardly any struggle, any discussion. M. Grévy was made to understand at once that the Senate was not disposed to allow him the right to order general elections. It thus happened that though the Constitution makes him irresponsible, and gives him the right to form at his will responsible Cabinets, the President found himself placed in the impossibility of accomplishing the duties of his office. He was like an animal placed under the pneumatic pump, who dies for want of air. Irresponsible in theory, he became responsible in practice, and not even responsible for his own faults—for faults which he had not himself committed.

Those who still care for constitutional law must see that a dangerous example has been given. Let us leave aside the person of M. Grévy, and let us talk only of the Presidential power. The Chamber of Deputies has learned

by what method and by what means it can dispose of a President almost as easily as it does of a Cabinet. The leaders of the various groups have nothing to do but to form a passive coalition; they can oppose their *non-possumus* to the President almost the day after his election. The Chamber of Deputies has learned, also, that the Presidential power does not find in the Senate a sufficient support. The present drift of our institutions is therefore markedly towards the convention system—the direct and absolute government of one chamber.

The Presidential power, so essential to the stability of the republican government, could only regain its importance if it was confided to one of those remarkable men who are a power in themselves, and who have an innate faculty for the government of men. M. Thiers may be cited as one of those men. He was capable of using any constitution so as to obtain the maximum of power. But the men of his type are rare. M. Carnot, who has been chosen by the Congress of Versailles as the successor of M. Grévy, was chosen for his negative rather than for his positive qualities. It was because the two fractions of the Republican party, which go under the name of Opportunists and Radicals, could not unite on the name of M. Ferry or of M. de Freycinet that they chose a third candidate. M. Carnot was elected by the unanimous vote of the Republicans of the two Chambers, but this unanimity itself shows that his personality was not very well marked, and that both parties expected to find in him an obedient instrument.

The division, which had ceased for a day, or, to speak more correctly, for an hour, became apparent as soon as M. Carnot attempted to form a Ministry. As he had been elected by all the Republicans, he attempted to satisfy them all, and to form a Cabinet of what is called Republican concentration—a singularly ill-chosen word, since, when you mix wine and water, you cannot be said to concentrate the wine or the water. M. Carnot tried, in his turn, every man in the Chamber, and spent ten days at the Élysées conferring with the parliamentary leaders and chiefs of groups. He took notes, and studied the situation with the exactness and method of a pupil of the Polytechnic School and of an engineer. Last night he finally succeeded in getting a Cabinet. The attempt made upon the life of M. Ferry in the lobbies of the Chamber of Deputies probably helped to hasten the solution. It was high time that the crisis should come to an end. The Radical press had inflamed the public mind, and the wretched man who fired at Ferry was incited to his crime by the bitter denunciations and ravings of the revolutionary party.

We have now a Ministry, as we have a President, and the fever may subside. The budget has to be voted; the new year is coming with its customary "grève des confiseurs." But the late events have left behind them a bitter and an ominous lesson. M. Carnot is known to be an upright, honest man; he is, no doubt, animated by the best intentions. He belongs to a republican dynasty, if the word may be used, and his very name is strength to the Republic. But he finds the Presidential power weakened, deprived of its prerogative, humbled, and almost impotent; he finds the Republican party split into two sections which are becoming more and more irreconcilable, as one of those sections is becoming allied to the communistic and anarchical elements of the population of the great cities. The walls of Paris have been covered with red placards signed with the names of the surviving leaders of the Commune of 1871. M. Rochefort, during the Presidential crisis, was a power in Paris. The Municipal Council received deputations from all the anarchical societies, and sent deputations to Versailles; it was all ready to proclaim the Commune if M. Ferry had been elected by Congress. It is idle to speak of "concentration" in the face of such demonstrations. No government would be possible if a handful of agitators, followed by a drunken mob, could dictate its will to the legislative power and appoint the executive power.

The present Chamber is doomed. It can neither give sufficient strength to the Executive power, nor can it reduce the revolutionary minority of the country to its natural insignificance. It has diminished the Presidential power, it has increased the danger of Communism. Sooner or later it will have to be dissolved, and the Senate will be forced to consent to its dissolution.

Correspondence.

THE PRESIDENT'S MESSAGE.

To the Editor of The Nation:

Sir: The President's message has already done the country a great service, even though its recommendations should be successfully opposed for a time. It calls into action a large class of cultivated men who had become disgusted with politics, and who were threatened with paralysis of all patriotic feeling. This condition of things constitutes a danger not less grave than the financial and commercial "condition" which it is sought to relieve. A few of these men, to be sure, have expressed their discontent with the low standards of the existing political parties, and, though few, they have already exerted a powerful influence. But many who naturally belonged with the "Mugwumps" or "Independents" took no active part, and did not even care to vote in the last Presidential election.

The late message has cleared the air, and one of the surprises of the next Presidential campaign is to be the number of cultivated men who will resume their functions as citizens. To rouse a large body of honest and well-informed citizens to exercise their rights, and to stir their patriotic feeling with a sense that it is once more worth while to consider the public good, and to strive to promote it—this is a service second to none rendered by any President since Lincoln. Mills Whittlesey.

Lawrenceville, N. J., December 24, 1887.

To the Editor of The Nation:

Sir: A general observer of political events might readily come to the conclusion that the voters and press of this country were divided into hostile camps, one composed of the friends of the President and the other of the adherents of Mr. Blaine. For the nonce, personal following seems to have taken the place of party ties, and the question is, not whether you are a Democrat or Republican, but whether you are a Cleveland man or a Blaine man. This state of affairs has had its immediate origin in the recent message of the President. Whether or not he intended to announce a policy of his own, such has been the result of his recommendations to Congress.

Never before in the history of the country (as far as the writer knows) has a message of the President been met, before the ink was scarcely dry, by a counter expression of views from the candidate whom he had defeated. Are publications of personal opinions, in the nature of pronunciamientos, by leaders of parties who more or less have control of party machinery, to take the place of platforms made by national conventions? If this is to be the case, our country may soon find itself on a level with South American republics, and be governed by a dictator.

If the politicians of the country rally to the support of this or that man as embodying the supreme intelligence of the country, let the voters of each party unite in choosing discreet and able men as their unpledged delegates to their respective national conventions, who will set forth in the platforms the distinctive principles of each party, and nominate men who will worthily represent those principles.

Yours truly, Talbot J. Albert.

Baltimore, December 27, 1887.

HOW IS THE TARIFF TO BE MODIFIED?

To the Editor of The Nation:

Sir: I am greatly interested in your clear and elementary articles on the tariff question. With free-trade education and proclivities, I am, nevertheless, in the iron business. You often refer to the iron trade. Would you object to giving a few plain answers to problems that are presented to any one in my branch of trade, taking a practical view of the situation?

(1.) I want to know what the President, Mr. Carlisle, and your editor mean when you advocate a reduction of revenues that will prevent a surplus. You oppose abolition of internal revenue, and therefore, of course, would take the $100,000,000 off the customs revenue. Now how would you do it? Abolish all tax on all raw materials, including wool, and you have made only one-eighth of the necessary reduction. Take off all tax on every form of iron and steel manufactures, and you have reduced another eighth. Take off that tax, and increased imports would prevent any reduction. To make the necessary reduction, therefore, must not Congress necessarily sweep the board and bring in free every form of cotton, woollen, silk, iron, steel, jute, chemical, and other manufactures? Is there any middle course? If so, give us an approximate idea of it.

(2.) What can the President possibly mean in proposing to so shape this enormous reduction of import duties as not to seriously affect the dignity and reward of American labor? I take it that other protected interests are not radically different from iron, and in this industry I speak from knowledge, being actively interested in blast furnaces in three widely separated American districts. A ton of pig iron on the furnace bank represents labor, and nothing else. The average cost now, taking the country over, is not less than $15.50 to $16.00 per ton—all labor. Take this to Chicago or St. Louis at an average freight, say, of $3.00, and it represents not less than $18.50 per ton, labor and freight. Add $1.00 per ton for profit, and you have just about the average market to-day at the great Western centres. (In Pittsburgh the selling price to-day is probably below cost of manufacture.)

Now, Scotch and English iron can pay $6.72 per ton duty and come within one or two dollars per ton of meeting these prices in Chicago and St. Louis. Take off this $6.72 protection, and there is an instant advantage of at least $5.00 per ton for the foreign manufacturer in the very centre of the American Continent. My furnaces have plainly one of two courses to pursue—shut up, or reduce cost (labor) by $5.00 per ton, or 33 per cent. Can you think of any other way? If not, do you think American mechanics, artisans, and laboring men, and the farmers who find manufacturing centres their highest priced markets, will permit any party to stand which advocates such action?

I ask these questions, not to argue for a system that has many inconsistencies, but to get

light on the practical phases of a question affecting every American citizen. H.

CINCINNATI, O.

[We have never advocated taking $100,000,000 off the customs revenue; but if that were desirable, we could find ways to do it without producing all of the evils apprehended by "H." The Bureau of Statistics classifies our imports, for purposes of convenience and simplicity, in six schedules, with the amounts of duty collected, thus:

Class A—Food and live animals.....	$67,998,330
Class B—Articles to be manufactured	19,567,903
Class C—Manufactures to be further manufactured.....	20,393,494
Revenue from these classes.....	$107,959,727

The other schedules are "manufactured articles ready for consumption" and "articles of voluntary use, luxuries, etc.," which need not be here considered. The "manufactured articles to be further manufactured" consist of tin plates, wire rods, paints, dyes, and chemicals, lumber, leather, furs, materials for hats, and woollen and worsted yarns. Pig iron is in the list of crude articles to be manufactured, and is an inconsiderable item so far as the revenue collected from it goes.

An effectual measure for the reduction of the surplus would be the repeal or reduction of taxes on the following articles:

Domestic tobacco.....	$30,000,000
Sugar (reduce one-half).....	30,000,000
Other food and raw materials.....	30,000,000
	$90,000,000

The surplus is a tremendous fact. It was $55,000,000 on the 1st of December. It is now $66,000,000. Any person who objects to any particular mode of reducing it is bound to show a better one.—ED. NATION.]

"IN THIS CONNEXION."

TO THE EDITOR OF THE NATION:

SIR: One of your correspondents, some months ago, ventured to characterize the words of my heading as at once "a New England phrase" and "a very illogical provincialism." My compendious reply to him, in No. 1127, was: "It is neither; and I could make good my contention." I now do so.

By normal development, *connexion*, originally abstract, has come to be also concrete, for "person or thing in connexion or connected"; and it is, further, used collectively, as in "the Whig *connexion*," "the Methodist *connexion*." But the fact is overlooked, by lexicographers, that it has been synonymized with *context;* except that, in this acceptation, it is seldom, however unobjectionably, found immediately preceded by the definite article. "*The connexion* goes to show," or the like, I do not remember to have met with more than once.

Etymologically considered, though not with the sanction of ordinary usage, like the Latin *contextus*, *context* signifies, according to Dr. Johnson's first definition of it, "the general series of a discourse"; a definition which the latest editor of Dr. Johnson's Dictionary, Dr. Latham, has omitted. As all but invariably employed, the term imports, with reference to a discourse or composition, viewed as a complex, one of its items, clauses, or topics, regarded relatively to something to which it is either adjacent or allied.

Connexion, precisely so taken, is exemplified in the subjoined quotations, &c.:

"This word, in certain *connexions*, denotes," &c.: "The word, . . . in all its *connections* throughout the Hebrew scriptures," &c. Rev. Martin Madan, *Thelypthora* (1780), vol. i., pp. 48, 62.

"Martin took the sentence out of its *connection*." Richard Porson, *Letters to Mr. Archdeacon Travis* (1790), p. 310.

"Here, then, we have not only the same argument stated, but stated in the same *connexion*." William Hazlitt (1807), *Political Essays* (1819), p. 413.

"By placing any of the arithmetic signs or words . . . in different *connexions*, they may seem (but only seem) to acquire and express different meanings." James Gilchrist, *The Labyrinth Demolished* (1815), p. 22.

"In such a *connexion*, . . . the indefinite article answers a useful purpose." *Id.*, *The Etymologic Interpreter* (1824), p. 138.

"Sulpicius also happens to mention, in *another connexion*," &c. Cardinal Newman (1833, &c.), *The Church of the Fathers* (2nd ed. of 1842), p. 412. And again (1842) in the Cardinal's *Essay on Ecclesiastical Miracles* (1843), p. 82, and in other works of his.

"Those who pick the word out of its *connexion*," &c. Rev. Dr. S. R. Maitland, *Remarks*, &c. (1836), p. 31.

"Its influence on the planting and manufacturing interests is a subject to be considered in another *connexion*." Miss Harriet Martineau, *Society in America* (1837), vol. i., p. 103 (ed. 1839). Also in vol. ii., pp. 117, 252, 306.

"This is almost the only *connexion* in which the word 'woman' is used." *Id.*, *ibid.*, vol. iii., p. 83.

"I certainly had not read it [*scil.*, a certain passage] in its original *connexion*." Rev. Dr. W. H. Mill (1846), *Five Sermons on the Nature of Christianity* (1848), p. 130.

"In another *connexion*." Rev. Mark Pattison, *Oxford Essays* (1855), p. 277.

"In such a *connexion*." Mr. Walter Bagehot (1859), *Literary Studies* (1879), vol. i., p. 213.

"In a different *connexion*." Dr. W. G. Ward, *Nature and Grace* (1860), pp. 349, 416.

"In different *connexions*." Rev. Benjamin Jowett, *Essays and Reviews* (1860), p. 371.

"In a different *connexion*," "in another *connexion*." Prof. John Conington (died 1869), *Miscellaneous Writings* (1872), vol. i., pp. 266, 458.

"In a somewhat different *connection*." Mr. Richard Congreve (1870), *Essays*, &c. (1874), p. 364.

"In such a *connection*." Mr. John Morley, *Critical Miscellanies*, vol. i. (1871), p. 313. "In the present *connection*." *Id.*, *Voltaire* (1871), p. 295 (ed. 1872).

"In such a *connection*." Mr. Leslie Stephen, *Hours in a Library*, First Series (1874), p. 321. "In any other *connection*." *Id.*, *History of English Thought*, &c. (1876), vol. ii., p. 403.

"In several *connexions*, . . . in different *connexions*." Mr. Matthew Arnold, *God and the Bible* (1875), p. 297 (ed. 1884).

"In the same *connexion*." Prof. Sidney Colvin, *Landor* (1881), p. 21.

Passing by unnoticed a great many similar proofs of my position which are at hand, I give four quotations exemplifying the not unusual substitution of *connexion* for *context* in a tralatitious sense:

"Many ideas may be excellent as parts of a great whole, which, when violently torn from their *connection*," &c. William Godwin, *An Enquiry concerning Political Justice* (1793), p. 220.

"A subject in all its import, meaning, *connections*, relations, aspects, and bearings." James Gilchrist, *Reason the True Arbiter of Language* (1814), p. 79.

"Meantime, the clergy were pretending to find express sanctions of slavery in the Bible, and putting words to this purpose into the mouths of public men who do not profess to remember the existence of the Bible in any other *connexion*." Miss Martineau (*ut supra*), vol. iii., p. 231.

"How should a story prove the existence of God, which, if told in any other *connection*, would only prove its narrator to be the victim or the author of a lie?" Mr. Leslie Stephen, *Hours in a Library*, Second Series (1876), p. 142.

On at least one occasion, William Hazlitt pretty clearly extends the meaning of *connexion*, so as to make the word equivalent to *discourse*. It is where, having premised the names of Byron and Scott, he goes on to say:

"We shall treat of them in the same [*i. e.*, one and the same] *connection*." *Spirit of the Age* (1825), p. 159.

Connexion is here much the same as *contexte*, agreeably to the first part of one of the definitions of it in the Dictionary of the French Academy: "Un texte quelconque, considéré par rapport à l'ensemble d'idées qu'il présente, ou au sens que certains passages empruntent de ce qui les précède ou de ce qui les suit."

The word *context*, in all likelihood, seemed too formal and technical to those who proposed, in place of it, *connexion* used restrictively. The latter has, however, but little affected, on the whole, the prevalence of the former; and we find, in the pages of a living author, even "in this *context*," in preference to the phrase which has been objected to. Mr. Richard Congreve has (1873):

"But, if I wished to indicate the general defect under which we labour, a general ground for our not producing a greater effect than we do, I should avail myself of the words of one of our number—not used *in this context*, but suiting my present purpose,—and say," &c. *Essays*, &c. (1874), p. 480.

As respects the particular combination "in this connexion," possibly it had not yet appeared in 1800; and, at present, I am unable to show that its age is more than half a century. That all along during that time, however, it has had the support of very good authority is evidenced by the ensuing quotations and references:

"Such, at least, is the theory; and one fact, *in this connexion*, is," &c. Miss Martineau (*ut supra*), vol. i., p. 277. Also in vol. ii., p. 28, and vol. iii., p. 75.

"*In this connexion* we are led to quote," &c. Cardinal Newman (1841), *Essays Critical and Historical* (1871), vol. ii., p. 272.

"*In this connexion*, therefore, it is full of interest to trace back," &c. Bp. Samuel Wilberforce, *A History of the Protestant Episcopal Church in America* (1844), p. 13 (ed. 1846).

Prof. F. W. Newman, *History of the Hebrew Monarchy* (1847), p. 354: *Miscellanies* (1869), p. 302.

Rev. G. S. Faber, *The Many Mansions*, &c. (1851), p. 437 (ed. 1862).

Rev. Dr. S. R. Maitland, *Eight Essays on Various Subjects* (1852), p. 150.

Saturday Review (1861), vol. xi., p. 662.

Literary Churchman (1861), vol. vii., p. 447.

Mr. John Morley, *Critical Miscellanies*, vol. i. (1871), p. 322. *Id.*, *On Compromise* (1874), p. 116.

Mr. Leslie Stephen, *Hours in a Library*. First Series (1874), p. 192: Third Series (1879), p. 198.

Rev. J. D. Aylward, in *Essays on Religion and Literature*, edited by Cardinal Manning, Third Series (1874), p. 86.

Dr. C. E. Appleton (1876), *Life and Literary Relics* of him (1881), p. 175.

Mr. J. A. Symonds, *Shelley* (1878), p. 85.

"George Eliot," *Impressions of Theophrastus Such* (1879), pp. 271, 348. The expression is there used figuratively.

Dr. W. G. Ward (1882), *Essays on the Philosophy of Theism* (1884), vol. ii., pp. 122, 132.

The want of sufficient specification in some of my old notes prevents me from referring here to the Rev. Dr. Whewell and many other authors of acknowledged repute.

Even if "in this connexion" stood, as it has been supposed to do, for the elliptical "in connexion with this," still it could not be arraigned either as "very illogical," or as violently unidiomatical. Nearly on all fours with it, thus understood, is "in his company," with which may be compared "on this account," "on this score," "in his stead," and similar expressions in abundance. Madame D'Arblay's "in its comparison," for "in comparison with or of it," is certainly very peculiar. See her *Diary and Letters*, vol. vi. (1846), p. 199.

"In this connexion," "in another connexion," "in such a connexion," &c., are, obviously, homogeneous. The second occurs, in the range of

my reading, as early as the first. Cardinal Newman has been cited for both of them; and, in the absence of proof, it is not lightly to be assumed that such a master of English idiom would countenance so illegitimate an ellipsis as "in another connexion," for "in connexion with another matter," or the like.

Finally, if the use of *connexion* for *context*, frequent as it is, had not been overlooked, probably the expressions here discussed would have incurred no censure. As regards "in this connexion," the late Mr. Edward S. Gould was well advised in declining the advice given him to condemn it. That it is "not often employed by the best writers in England" is one of the numerous statements hazarded by the editors of Dr. Webster's Dictionary which require modification, while their primâ-facie explanation of it, "in connection with this subject," calls to be revised.—Your obedient servant, F. H.

MARLESFORD, ENGLAND, December 13, 1887.

ROBERT SOUTH AND THE ENCYCLOPÆDIA BRITANNICA.

TO THE EDITOR OF THE NATION:

SIR: In the last volume of the 'Encyclopædia Britannica' (volume xxii), in the article "Robert South," it is said: "In 1710, he (South) showed himself a keen opponent of Sacheverell." Now, in the memoir of Dr. South which is prefixed to the edition of his works published by Bohn of London, in 1850, it is said (page vii): "His zeal for the welfare of his beloved Church lost none of its ardour, and we are not surprised to find that, among the last acts of his public life, was his interesting himself on behalf of the notorious Dr. Sacheverell."

Again, Dr. Lake, the present Dean of Durham, says in his essay on South (Kempe's 'Classic Preachers of the English Church,' p. 64): "[He] was a warm supporter of Sacheverell." Confidence in this statement may be somewhat impaired by the fact that Dr. Lake adds that this occurred "in 1670," whereas Sacheverell was not born till 1674. The internal evidence, however, would be all in favor of Dr. Lake and the Memoir and against the 'Encyclopædia Britannica.' Sacheverell was an ardent Tory, who preached two sermons in 1709, declaring the Church in danger from the course of the Whig Ministry. For this he was prosecuted in February, 1710. South, too, was a strong Tory, and was all his life proclaiming the divine right of Church and State and non-resistance to royal ordinance. It is in the highest degree improbable that he should be a "keen opponent" of a man whose position he so thoroughly sympathized with as that of Dr. Sacheverell. I have not at hand the means for consulting authorities more widely and determining whether the 'Encyclopædia Britannica' has made a mistake here, as would seem to be the case. Can any of your readers settle the question?

It is also stated in the same article that South was, before the Restoration, "a strong supporter of Presbyterianism." I can find no evidence of this, except the fact that in 1655, the year in which he took his B. A. degree at Oxford, he published a Latin panegyric on Cromwell. When we remember that Latin verses in England, even in our own day, are not the most natural medium for the expression of the author's opinions, and that the subjects for such verses are often set by the college authorities, stronger proof of South's ardent support of Presbyterianism will be needed than these verses. As negative proof that he was not attracted to Presbyterianism are to be noted the facts that he satirized the Puritans in his public capacity of *Terræ Filius* at Oxford; that he drew upon himself the severe reprimand of Dr. John Owen, Cromwell's Vice-Chancellor of the University, for continuing to worship according to the liturgy, after it had been prohibited; that he was admitted to holy orders in 1658 by a deprived bishop, whereas, if he had been an adherent of Presbyterianism, he would naturally either have sought ordination from Presbyterian authorities, or, if more Episcopally inclined, from some conforming bishop; and that in 1659 he made a violent attack in his sermon, "The Professors of Godliness, but Workers of Iniquity," on the Independents—though this, it is true, it is possible he might have done if he had been a Presbyterian. South has quite enough to answer for in being always the champion of the established fact, without compelling him, unless such was unquestionably the case, to answer so grave a charge as that of a change from a "strong supporter of Presbyterianism" to a bitter opponent of it in a very brief time. Can any one confirm or convict the 'Encyclopædia Britannica' here again? FREDERIC PALMER.

JENKINTOWN, PA., December 28, 1887.

Notes.

CHAS. SCRIBNER'S SONS' near publications are the 'Memoir of Fleeming Jenkin,' by Robert Louis Stevenson; 'The English in the West Indies,' by J. A. Froude; 'Old Spain and New Spain,' by the Rev. Henry M. Field; a new edition, thoroughly revised, of J. J. Knox's 'United States Notes'; and an English translation of Prof. Franz Delitzsch's latest edition of his 'Commentary on Genesis.'

Anson D. F. Randolph & Co. will publish immediately 'The Triumph of the Presbytery of Hanover; or, The Separation of Church and State in Virginia; to which is added a Concise History of the Presbyterian Church in America, from 1705 to 1888,' by Jacob Harris Patton, M.A., Ph.D. They will also put their imprint on the 'Life of Samuel Morley,' by Edwin Hodder, author of 'The Life of Lord Shaftesbury.'

The Dante Society announces that the Concordance of the 'Divina Commedia,' upon which Prof. E. A. Fay has been engaged for some time, and of which we have already spoken, is now ready for printing. The volume will contain between eight and nine hundred pages, and the greatest care will be taken to insure accuracy in the printing. The price in cloth is ten dollars, by subscription. It is hoped that there will be a ready response from the scholars of the country to aid in crediting America with so valuable a publication. Subscriptions may be sent to Mr. John Woodbury, 10 Tremont St., Boston, or, in Europe, to Messrs. Trübner & Co., Ludgate Hill, London.

Prof. W. I. Knapp of Yale is still desirous of obtaining material for his Biography of George Borrow. A condensed sketch of the career of this remarkable man was prepared by Prof. Knapp for the November *Chautauquan*, and he has reprinted it as a little brochure for private distribution in furtherance of his researches.

We have already noted, at the time of their appearance in *Scribner's*, the letters of a young woman at the beginning of the century, which are now published in an attractive book-form under the title 'A Girl's Life Eighty Years Ago' (Scribners). The scope of the correspondence, which ranges over Portland, Boston, Saratoga, New York, and Charleston, gives a broad view of the conditions of our early social life. The illustrations are numerous and well printed, and the portraits of old Salem and other worthies have almost an historical interest in our social annals. Clarence Cook furnishes a sympathetic and competent introduction.

An American edition of S. C. Hall's 'Book of British Ballads' was published in 1844. The collection seemed a proper one for the series called "Knickerbocker Nuggets" (Putnams), and it takes its place there so far transformed as to have very abridged notices of the several ballads, relegated to an appendix instead of being prefixed, and all the original illustrations reduced in size to fit the tiny page. For decorative purposes this reduction is no loss. The finest type called for by the scheme is an occasional hardship to the eyes.

Dryden's Poems, more of Plutarch's Lives, Shakspere's "Winter's Tale" (with its progenitor, Greene's "Pandosto"), and Southey's 'Colloquies on Society,' are the latest issues in the pocket "Cassell's National Library."

The 'Jubilee and Plantation Songs' published by Oliver Ditson & Co. is a selection which one may be glad to own who cares to preserve specimens of this indeterminately large class of truly American compositions. It draws upon the stock of the various colored college singers, with but little indebtedness to the best extant collection, the 'Slave Songs of the United States.' Even when the titles and words are the same, a great difference in the airs is often remarkable.

L. K. Strouse & Co., New York, send us seven numbers of the first volume of the official edition of the Inter-State Commerce Commission Reports—a series destined to be classical in the literature of transportation the world over.

A *Civil-Service Chronicle and United States Consular Record* is to be edited in Boston by C. B. Norton, and published monthly at a low price. It will supply practical information in regard to the civil service, examinations for admission to it, preparation and study for it, etc. It will keep the run of consular affairs, and give extracts from consular reports. It will favor the growth of foreign trade, and advocate steamship subsidies to South American ports.

Book-Lore has been absorbed into the *Book-Worm* (London: Elliot Stock; New York: Geo. J. Coombes). The first number of the new journal bears date of December, 1887. It is smaller, handier, and typographically more attractive than its predecessor. Its aim, as well as we can make out, is to popularize the love of books by spreading readable information about "old-time literature." It is illustrated, and starts with an interesting table of contents, in which Mr. Henry B. Wheatley's paper on 'John Wesley's English Dictionary' would be generally allowed to be of first importance intrinsically and in the line of the magazine.

The *Art Age* for December issues as a detached supplement an admirable engraving, by Elbridge Kingsley, of a wood scene, "Silence," after the painting of that name by Wm. Bliss Baker. The block is very large (14½x10), and in all respects the print is suitable for preservation by framing.

Vol. ii of *Modern Language Notes* (1887) lies before us, neatly bound. It would be impossible, of course, to give even an inkling of contents so diversified. We can only congratulate the managing editor, Prof. Elliott, and his associates, Messrs. Bright, Goebel, and Todd, upon their success. What seemed a problem two years ago is now an assured fact. The *Notes* already take the lead in all matters per-

taining to the scientific teaching of modern languages and literatures. This comes of having a high purpose and the courage of one's convictions. We have only one remark to offer upon the general direction of the *Notes:* it is, that English philology has not the prominence that one might look for in an English journal. This bias towards the foreign is doubtless one of which the editors are not at all conscious. It is at bottom the result of occult psychological forces. Educated as so many of us have been in foreign schools, we are apt to overlook the truism that the foreign is there the *native*. If we are to rival the Germans, for instance, not merely in form but in spirit, we shall give the lion's share to our own modern language, as they give it to theirs.

Carl's essay on the life and works of Thomas Lodge, *Anglia* x, 235-238, is a good summing up and restatement of what was already known, but it scarcely adds to our knowledge. Like so many other disquisitions in the *Anglia*, it suffers from an overflow of "Quellen"; the three pages of authorities might profitably have been condensed into one. And one monograph on Lodge, the most important of late years, is strangely conspicuous by its absence—we mean Gosse's paper, in his 'Seventeenth Century Studies' (London, 1883). From it Carl might have learned of Lodge's being entered at Merchant School, March, 1571; also that the non-mention of Lodge in his father's will by no means implied disinheritance for bad conduct. Carl does not seem to be aware of Lodge's later proclivities to Roman Catholicism, touched upon by Gosse. Read in this light, the passage, cited p. 261, condemning the use of Scripture for the drama, is anything but "irony"; it is rather the language of a convert.

The latest issue of the *Englische Studien*, xi, 1, contains an instructive article of twenty-five pages by Krummacher on the language and style of Carlyle's 'Frederick II.' We are all familiar by this time with Carlylese, its strong and its weak points. But such a systematic treatment of it by a well-trained foreigner will give us a clearer perception of its oddities. The words are arranged in alphabetical order. Not the least valuable portion of the paper is that which treats of compounds and derivatives. The author has erred occasionally in treating as Carlylese what is common literary property—thus, "abeyance," page 80. "Doggery," page 83, can scarcely be a rendering of *Canaille;* "thimblerig-filouterie," page 82, is too obvious in meaning to call for a (?). "Inarticulate," page 85, is interpreted "beliebter Ausdruck für wortkarg, verschlossen, unberedt, auch für unverständlich"; not one of these quite hits the mark.

An interesting recent Russian publication is 'Old St. Petersburg,' by M. I. Pylayeff, with numerous illustrations taken from old prints. The city is old enough and has undergone enough changes to render such a book appropriate, though it cannot compete with many other European capitals in the beauty of its ancient structures, whatever may be said about the buildings of the present day.

General Alexander von Kaulbars, before he became so conspicuous in Bulgarian affairs, was chiefly known as explorer of the Oxus, or Amu-Darya, River and its basin. He has recently issued a new book on the subject, entitled 'The Most Ancient Beds of the Amu-Darya.' Thanks to the labors and investigations of specialists, one of the most prominent questions of late has been as to the former course of that Central-Asian stream, and it is a question of some interest independently of its purely scientific aspects. Recent researches have revealed traces of the former channel of the river through the present oasis of Khiva, below Pitnyak, and further out on the steppe towards the Sari-Kamyshk basin, and also of an ancient channel through which the overflow of this basin reached the Caspian Sea. General Kaulbars's latest volume is devoted to the subject of these ancient channels; and he notes the traces which are met with above Pitnyak, along the banks of the river's present channel, and in the stretch lying between Khiva and the northern extensions of the Paropamisus, nearly to the Caspian Sea. His volume is published by the Geographical Society at St. Petersburg, is accompanied by charts showing the altitude of various points above the level of the Caspian Sea along the line of Tcharjui-Merv, etc., by a detailed chart of the country between the Caspian Sea and the Sea of Aral, of the districts adjoining the Amu-Darya, and by other charts.

The December Proceedings of the Royal Geographical Society contains a brief sketch of Mr. A. D. Carey's remarkable journey in 1885 from Ladakh through Central Asia and from Lob Nor across the Altyn Tagh into northern Tibet. The solitariness of part of the region through which he passed can be realized from the fact that for eighty days he did not see a human being save the members of his own party. When they at length reached an inhabited place, his followers in an ecstasy of delight knelt and kissed the first human foot-prints which they saw. There were some fertile tracts, but this part of Turkestan is generally very sterile, and the people are wretchedly poor. They were very friendly, however, and apparently well governed. Crime was rigidly repressed, and life and property as safe as in India. At one point Mr. Carey reports falling in with an incredible number of antelopes, and at another he saw tigers hunting on the ice.

Petermann's Mitteilungen for November contains the conclusion of Dr. V. Jhering's report on the German colony in the Brazilian province of Rio Grande do Sul, together with a sketch of Capt. J. S. King's explorations in Somaliland. Dr. Schinz throws very serious doubts on the genuineness of Mr. Farini's 'Through the Kalahari Desert,' hinting very plainly that it is nothing but a "Jules Verne'sche" romance. A supplementary number contains an elaborate monograph on the island of Corfu by J. Partsch, accompanied by three admirable maps.

The third part of 'Bibliographie générale et raisonnée du droit belge,' by Edmond Picard and Ferdinand Larcier (Brussels: F. Larcier), has been published during the year and completes the alphabet of authors. The three parts, of which the first was published in 1882 and the second in 1885, make one volume of 867 octavo pages. A second volume is to contain the periodicals, series, and all the anonymous works, notwithstanding that when the authorship of an anonymous book has been discovered, the title appears under the author's name in this first volume. The publisher also promises a subject index. The period covered begins with the year 1814, and the number of titles recorded is 6,786. This number includes, however, the contributions to 136 periodicals and society publications which are indexed. When these are deducted, there remain about 4,200 titles of books and pamphlets upon law subjects issued from the press of Belgium in something like seventy years. Aside from a large number of inaugural dissertations in Latin, nearly every book is in the French language, the only exceptions being seventy-one titles in Dutch, three in German, and a single one, 'The Laws of Belgium which Affect British Subjects,' in English. The titles are given with reasonable fulness, including the place of publication, name of publisher, and date, while the size of each book and the number of pages it contains are stated, and, when it was published for sale, the price is added. Only the last edition of a work is catalogued, but in a note the dates of the earlier editions are mentioned, and the notes also contain brief references to review notices, while, in the case of deceased authors, biographical references are appended.

The new Berlin school for the study of Oriental languages has 115 students, 40 of whom are preparing for the diplomatic and colonial service. There are about as many who expect to be teachers and naturalists or explorers, the remainder being merchants' clerks. The Arabic and Chinese classes are most numerously attended, the Japanese and Turkish coming next.

—In the January *Atlantic*, fiction comes well to the front, with two new serials, and the prospectus for the year promises yet a third from the pen of Henry James. The leading place is given to a novel fresh in topic and treatment, the scene being laid in Japan. The opening chapters introduce us to a missionary circle and exhibit the limitations of mind and culture in some of its members, with an unsparing frankness. One overhears in the comments of the principal character, who tells the story in his own person, the author's disapproval of some traits which it is not surprising to find in earnest and narrow persons from among whom the ranks of missionaries are necessarily recruited, and there is something of harshness in the words used, however just they may be in particular cases. But the Japanese heroine is drawn with a tender touch, and has the pathetic quality apt to be found in aliens who interest the Western mind; and the episode of her early life, which is the main incident of these chapters, is a delightful child-story. The progress of this tale from a new hand will be looked for with a humanitarian's as well as a novel-reader's interest. The other serial is from Miss Murfree, whose engraved portrait accompanies the number; it is in her well-worked style. The remainder of the contents is variously made up of travel to the two Golden Horns of Constantinople and California; of some letters of Franklin to Strahan which illustrate the sort of books our great-grandfathers read; and of a short contribution by Mr. Edward J. Lowell to the endless discussion of what should constitute a liberal education for an American boy, from the point of view of the smaller college. Mr. James Russell Lowell contributes a brief poem in lyrical form, which exhibits both the grace of his muse and the mastery of his hand, and is another foretaste of the promised volume for which the public still waits.

—The illustrated article in *Scribner's* is one upon mediæval armor. It is very complete, and is accompanied by a text which is not too technical, though somewhat difficult to follow as a history of armor. The Great Pyramid, a subject whose interest seems to be as eternal as the stone, is admirably pictured from many points of view, and the story of its exploration in modern times is well told. Fiction is represented by a new long novel by Mr. F. J. Stimson, "First Harvests"—presumably the first results of American civilization in society. The scene is in New York, the characters are fashionable, the tone is cynical to a fault; the work has received high finish, and there are some beautiful descriptions of the sights of an oil refinery, in which there was opportunity for the author's poetic feeling. Mr. Brownell continues to exalt the French genius for intelligence, but his essays suffer from comparison with Mr. Hamerton's late papers. Mr. Lang

has a charming motive for a poem in "American Antiquities," of which he makes the most he is able to do; and Mr. Aldrich contributes a pathetic single-thought poem, "White Edith." A very interesting article to those whose taste leads them to Oriental art is from the hand of Mr. William Elliot Griffis, on "Japanese Art, Artists, and Artisans," with illustrations after drawings by a Japanese artist. Municipal finance and Balzac are topics to add variety, and the number is rounded off by Mr. Robert Louis Stevenson, who confides to the reader how his waking moments have been served by his dreams, which have given suggestions or scenes for some of his stories.

—The interest of the January *Harper's* lies largely in its illustrations. Two of the contributions treat directly of art subjects, and yet in such a way as to leave the pictures in the first place. The "Adoration of the Magi," which leads the number, shows the changes of rendering and spirit which different times have brought about in the case of one of the constant themes of the painter's imagination, from the walls of the Catacombs to the Church of the Incarnation in this city; and the article upon "French Sculpture" makes the modern masters of France known by a number of examples of their characteristic works. The text of both papers is inferior. Archdeacon Farrar's sketch of the share of America in Westminster Abbey is also mainly attractive from its cuts; but the attention of those who are interested in placing memorials in England to testify to American filial piety, may be directed to the Archdeacon's desire to "erect a worthy window" to John Milton's memory in the Church of St. Margaret's, and his declaration that if any of Milton's American admirers should be willing to assist in this design, he would "on public grounds most heartily welcome their munificence." The twenty portraits of Italian Deputies, principally ministers, are also of interest to the eye, and the text is what it should be, brief and to the point. Mr. Watterson writes of the tariff from the reformer's standpoint, but hardly with the closeness and point specially desirable now. The city of Savannah is graphically laid before the reader in an article that glows with the optimism and pride of the new South, and is materially instructive as well. Mr. Black begins a new novel, and Mr. Curtis again passes to his readers the compliments of the season.

—The 'Social History of England,' by Louise Creighton (London: Rivingtons, 1887), is the second contribution to a series called "Highways of History," edited by Louise Creighton, the first volume of which, 'The Government of England,' by the same author, appeared in 1884. "The aim of this series," says the prospectus, "is to give consecutive treatment to certain important subjects in English History. . . . The treatment of the subjects in this series is adapted for the use of students who have already mastered the general outline of English History, but wish for more connected information with regard to some special point. Each part is complete in itself, and treats of its own subject without reference, except where necessary, to the general course of events." In the 'Social History of England,' the author has, on the whole, done her work admirably. Every important phase of social development, from the mark system of the Saxons, the medieval towns, gilds, monasteries, feudalism, villeinage, etc., down to the reforms of the nineteenth century, is briefly but ably and comprehensively discussed. In a compilation like this, based on many authorities, some omissions and errors of detail are inevitable. On p. 10 the important points of divergence between English and Continental feudalism should have been briefly characterized. The distinction between court baron and court customary, on p. 13, is not fully enough stated. The old gild-halls of England did not bear the name *hans hus*, as asserted on p. 21, except perhaps in the two cases of Beverley and York. The *firma burgi* was not merely the right of the burgesses to collect the royal dues belonging to a town (p. 23), but the commutation of those dues by the annual payment of a fixed sum of money. There is no good authority for the statement, on p. 25, that "a branch of the famous Hanseatic League had been established in London certainly since 967." For *firma burghi*, on p. 23, read *firma burgi*; for *Gilda Teutonicurum*, on p. 39, *Gilda Teutonicorum*. But we are not inclined to emphasize these and some other shortcomings that have attracted our attention. The work is a compilation of real merit, which may be safely commended not merely to young students, but also to older persons seeking to supplement or to refresh their knowledge of the *Culturgeschichte* of England.

—Sievers's Anglo-Saxon grammar, whether in the original German or in Cook's translation, is doubtless somewhat bulky and complicated for the beginner. Admitting this, we cannot withhold from the 'Outline of Anglo-Saxon Grammar,' by Baskervill and Harrison (A. S. Barnes & Co.) the merit of undertaking to meet a practical want. The pamphlet is an "offprint," with some corrections, of the Appendix to the Dictionary, published two years ago. But we suspect that the editors are not fully abreast with the times. Why, for instance, do they adhere to Koch's antiquated classification of strong verbs, instead of following the more scientific classification of Braune, Sievers, and Noreen? Or treat tōd, fōt, bōc as *mixed* stems? Or speak of *niht* as indeclinable? Aside from the adverbial genitive *nihtes*, mentioned by them, we find a genitive *nihtes* not adverbial, a genitive *nihte*, a dative *nihte*, gen.-pl. *nihta*, dat.-pl. *nihtum*. The statement, page 65, that the verb forms (*a-hwī*) are based on Bosworth-Toller and Groschopp, and the orthography corrected by Sweet's 'Reader,' is not encouraging. It would have been incomparably safer to follow Sievers's second edition implicitly. And what is meant by *regular* verb-forms? Followers of Sievers know that there are dialects in early English, and that in each dialect there are early and late forms. But they know nothing of regular forms as distinguished from irregular. The editors have retained throughout such spellings as *ȳwan* (printed *ywan*). Is this regular, in distinction from the earlier Wessex *īewan*? And of the six forms *gerwan*, *gærwian*, *girwan*, *gierwan*, *gyrwan*, *gearwian*, which is regular? The infinitives *pīhan*, *tîhan*, *rafan* would be difficult to demonstrate. Such errors of method and of detail will render the 'Outline' unsafe for the beginner, for whom it is intended.

— That the present generation is suffering from lack of a book about the "animals of antiquity," is an idea that had not hitherto forced itself upon our attention, especially since the appearance of Victor Hehn's excellent work upon 'Domestic Plants and Animals in Their Transition from Asia to Greece, Italy, and the Rest of Europe.' We had thought that Hehn, whose work is full of quotations from Greek and Latin writers, and has long been an authority upon what may be called the philology of our familiar plants and animals, must have exhausted all the more interesting aspects of the subject, scientific as well as sentimental. But now comes Otto Keller, assuring us "that there is probably no point upon which the learned world are so perfectly agreed as upon this, that a usable book upon the animals of antiquity is a real need of contemporary scientific investigation." This remark is made, as any one might guess, in the preface to a new book by Herr Keller. The book is entitled 'Thiere des classischen Alterthums in culturhistorischer Beziehung' (Innsbruck, 1887). It has, speaking roughly, 300 pages of text to 200 of notes, but in spite of its prodigious wealth of learning it is modestly styled "only a beginning." The treatise has a chapter, long or short, upon each and every animal known to have been in any degree familiar to the ancients. The general reputation of the beast, his habits and habitat, exact observations and loose superstitions concerning him, are all set forth from the authorities, the author taking special pains to note any facts having a bearing upon mythology. A feature of the book is the illustrations from ancient reliefs, vases, gems, mosaics, coins, etc. For this purpose the treasures of the British Museum and the museums of Berlin and of Brussels have been specially drawn upon, most of the illustrations having been engraved especially for this volume. In the pictorial department of the work, as also to some extent in the text itself, we find not only Greek and Roman, but also Assyrian and Egyptian antiquity represented.

—A correspondent writes us from St. Petersburg under date of November 27 (December 9), 1887: "An eminent artist here has in his studio two recently finished portraits of Count L. N. Tolstoi, not yet shown to the public. He has made an exception in my favor. The portraits published last summer in America were taken two years ago, but the larger of these I speak of represents him as at least ten years older, with hair lying close and thin on his temples, and with the beard smaller. The folds of the black gown girt about the waist with a cord conceal the lines of the figure, and one hand holds a book—an English socialistic book, the name of which the artist has forgotten. The head, though greatly changed and aged, bears the same stamp of power and sadness which is so striking in previous portraits, and the features are more marked than ever. The second picture is small, and represents Count Tolstoi ploughing in the fields, with the harrow hitched to the rear of the unwieldy plough, which is drawn by a white horse along the slope. The Count's gray beard streams sideways across his blue blouse and half-bared breast, and his cap is pulled well down over his face. This portrait was painted on the spot last summer, and is only less interesting than the large one. This beloved author's scheme for the preparation of reading-books for the people flourishes. I know the wife of a Senator who has prepared a life of Socrates (and prepared it admirably) for this purpose, which Count Tolstoi corrected, and which sells for two cents. Her name does not appear (nor does his) in the matter; and he has other assistants who are equally modest. An important step in the direction of popular education has also been taken by the authorities, and nowhere will its importance be more thoroughly appreciated than in America. The first free public library, in honor of the memory of the poet Pushkin, was opened here day before yesterday, and all day yesterday it was thronged. It begins with the modest outfit of four thousand volumes, acquired from various sources, and the intention is to establish a great many more like it, with the hope that workingmen may thereby be induced to abandon the dram-shops. Though the Imperial Public Library is accessi-

ble to everybody, it is by no means free in the American sense of that term; it is more like the Astor Library, and the officials shake their heads in amazement and doubt when I reply to their queries as to whether we have any 'public libraries' like it in America. No books are permitted for use at home. Only personal friendship with a librarian will give one that privilege in the librarian's name. It seems that the public here abused the privileges accorded to them even in the matter of a full printed catalogue, of which it was found impossible to keep a perfect copy on hand, so that now only a partial catalogue is generally available, and not a single book can be had without a signed application. In many cases, also, an application made in the morning is only filled after three P. M. or the next day. These precautions are probably the outcome of unpleasant experience; but the effect upon the officials of such an establishment of my description of the unprotected reference books and the general methods in American free public libraries can be better imagined than described."

RENAN'S HISTORY OF ISRAEL.

Histoire du Peuple d'Israël. Par Ernest Renan, member de l'Institut, professeur au Collège de France. Vol. I. Paris: Calmann Lévy; New York: B. Westermann & Co. 1887.

In order to complete the 'History of the Origins of Christianity,' which he initiated a quarter of a century ago with his 'Vie de Jésus,' and continued in 'Les Apôtres,' 'Saint-Paul,' 'L'Antechrist,' 'Les Évangiles,' 'L'Église Chrétienne,' and 'Marc-Aurèle,' M. Renan goes back to the early history of the nation to which the founders of the Christian religion belonged, tracing the origins to their remote springs, "the great prophets who introduced morality into religion about 850 years before Jesus Christ." But then, "prophetism itself has its root in the antique ideal of patriarchal life, an ideal created partly by fancy, but which had been a reality in a remote part of the Israelitish tribe." Consequently Renan must begin the beginnings with the history of Hebrew patriarchal times. But is there such a history? Have any records of it been preserved? Are the Biblical Abraham, Jacob, Joseph, historical personalities? M. Renan has not the least hesitation in answering these questions with a bold negative. Abraham is a transformed recollection of a mythical Babylonian King—the good Orham, or "father Orham," Ab-Orham. Jacob and Joseph are abridged names of nomad clans, Jacob-El and Joseph-El, devoted to the worship of El, like Ishma-El and other Arab Elites. The stories told about them in Genesis are childish tales, full of miraculous traits, which readers of our time cannot but find absurd in the highest degree. Yet such is the vast learning, Biblical and Semitic in general, at the disposal of our writer, and such the magic power of his poetic fancy and descriptive diction, that he can venture to reconstruct Israel's earliest history, partly out of general observations on Arab nomad life and primitive institutions, and partly out of scanty historical threads woven by the ancient Hebrews into their myths and tales.

As we remarked on a much earlier occasion (see *Nation*, No. 213), "M. Renan, without any qualification, rejects as incredible everything supernatural; but the shadows that accompany the delineations of supernatural things he saves, and — quite as artfully as artistically—works them into new images. His new images are often excellent imitations of the sacred ones he tears; but while orthodoxy must spurn them as devoid of all sacred substance, mere unimpassioned criticism, too, can see in them little more than shadows." Thus he created his Jesus and his Apostles, and painted their Galilee and the cradle-time of Christianity, and thus he reconstructs and paints, with admirable skill, Israel in his infancy and childhood. We use this personal (and Scriptural) form of expression, for under the poetic pencil of our author the nation becomes a hero, and its history a biographical epic. He follows Israel in his wanderings—as a child—from Arabia, along the western banks of the Euphrates, to Padan-Aram, to Canaan, into Egypt. For this period of his hero's life he has nothing but fond sympathy. Israel walks, or might have walked, in perfect simplicity and innocence; his God, then, was the homeless nomad's El, or Elohim, a benevolent, impartially just, unnational, universal god. The pictures of this life, of this faith, are impressive and beguiling from apparent naturalness of delineation and coloring. And everything is chastely done, almost to the exclusion of ornamentation, which saves the idyllically sublime from becoming ridiculous. Nor is the necessary support from varied stores of antiquarian and Oriental lore wanting to the tableau.

The reader must not hastily form the conclusion that M. Renan's epopee of Israel will be as unmixed in features as that of Jesus or St. Paul. Far from it. His Israel will become a nation in Egypt, and "alas! since the beginning of the world no amiable nation has yet been seen." Elohim will be exchanged for Yahveh (Jehovah), a special national god, a god-protector of Israel. The national idea will demand a god caring only for his nation, to the detriment, the abasement, the woe, of all its opponents and rivals. The theology of Israel, in Shiloh and Shechem, Jerusalem and Samaria, will be as black (the author does not spare the color) as it was pure and amiable under the starry skies and in the healthy air of the desert. The Jehovah of the time of the judges and early kings is not just and kind like El, "the Elyon or the Shaddai of the patriarchs." He is "shockingly partial" to Israel, "frightfully hard" to other nations. "Il tue, il ment, il trompe, il vole pour le plus grand bien d'Israël." Fortunately for the world, the development of Hebrew theology does not end there. "It will be the work of the prophets"—of the ninth century B. C., and of their successors—"to recreate the Elohism of old by dint of reflection," to perfect it, to bring their people back to it, to make it the perennial stream from which all nations will finally draw waters of bliss. "Elohim is the universal God, the God of mankind. In reality, it is to Elohim, not to Yahveh, that the world has been converted. The world has become theistic—that is, Elohistic, not Yahvistic. It has forgotten how Yahveh's name was pronounced; every one, to eternity, will furnish it with vowels as he fancies. Neither Christianity nor Islam knows Yahveh." This is, in fact, the keynote of the volume.

These are surely radical notions for an historian of the chosen people, a student of the origins of Christianity, who began his work, and continues it, with a kind of religious ardor. But radical and bold as all this is, the history, as such, must be pronounced far from destructively critical compared with recent German works on the same subject. Wellhausen, in his well-known sketch of the history of Israel (published in the 'Britannica') wastes not a paragraph on the patriarchal period—to which our author devotes 150 pages—evidently deeming all the traditions concerning it completely valueless as a substratum for history. Stade, in his extensive work (see *Nation*, Nos. 1132 and 1133), barely alludes to them in a few lines, distinctly declaring: "Irgend eine historische Gewissheit ist bei dem bruchstückartigen dieser Ueberlieferungen und ihrer durchgängigen Versetzung mit mythologischen Elementen nicht zu gewinnen." He not only ignores all that is told about the migrations from Ur of the Chaldees to Haran through Canaan, but also the sojourn of the Israelites in Egypt, and their march under the lead of Moses to Sinai, and thence to Gilead. M. Renan has chapters on "The Beni-Israel in Egypt," on "Egypt's Influence on Israel," on "Israel's Exodus," on "Israel in the Desert of Pharan," on "Sinai," and on "The March toward Canaan," devoting much learning, some original criticism, and animated diction to particulars which the more consistent German critics reject as completely fictitious.

M. Renan's inconsistency in rejecting the bulk of the Pentateuchal narratives—all that has real historical importance—as legendary and rather idle tradition, and picking out some few slender threads, presumed to be of older texture, to weave them into a fanciful work of historical reconstruction, is flagrant. He knows no Joseph (barring the clan Joseph-El), no clearly historical Moses—"quoique son existence soit très probable"—no Aaron, no Levites, and doubts the existence of a Joshua; and yet he enters upon speculations on the route taken by the Israelites at the exodus from Egypt, imagines a substitute for the crossing of the Red Sea, speaks of Marah, Elim, Rephidim, Meribah, etc., and introduces Sinai in the highest strains of descriptive rhetoric. When we examine his fascinating narratives, we find them hollow. Israel is said to have become a people in Egypt—"Israël n'est plus une tribu, c'est déjà une nation"—but a little brackish water, sweetened by the infusion of "certains branchages," keeps up this people at Marah, and seventy palm trees and some tamarisks give it shade at Elim. Of course, M. Renan reduces the millions of the fugitive Israelites to a comparatively very small number, and their forty years' wandering in the desert to a very rapid march through it—though with a senseless deviation "toward the awful wilderness" of Sinai; but in order to explain away an unavoidable residue of the miraculous, he must still resort to remarks like the following: "The fugitives might have taken along grain and provisions from Egypt. By means of the precious things which they had appropriated to themselves, if the narratives be credible, they could have procured something from the Ishmaelitish or Midianitish merchants, or form a herd for themselves. Possibly the [Sinaitic] Peninsula was not so denuded three thousand years ago as it is at present." "Might," "if," and "possibly" are poor substitutes for the wand of Moses, a surfeit of quails, and plenty of manna from heaven.

The fact is, M. Renan is a much more radical unbeliever now than he was when he wrote his 'Vie de Jésus,' and he is still as Bible-loving, imaginative, and artistically ambitious as he was then. Purposing to write a history of Israel without the least admixture of the supernatural, he cannot resign himself to presenting it incomplete, with gaps, and devoid of its exceptional embellishments. A disciple of the prophets and Bossuet, a critical follower of Kuenen and Wellhausen, and always poetical, he turns what he cannot accept as a sacred account and is unwilling to reject as an historical romance, into a romantic history. He begins with dissecting legend, and ends with rehabilitating it, forgetting his own maxim, "Il y a du danger à chercher trop d'histoire dans de vieux

rêves où les spectres ne se distinguent pas des hommes." From the scanty footprints of the infant Israel—and to him we must limit our remarks here—a whole image of him is drawn, with the magic help of Semitic philology, Arabian archæology, Babylonian and Egyptian lore, and philosophy and poetry. The interspersed remarks, learned or other — partly drawn from the author's numerous previous works and dissertations—are generally suggestive and seductively plausible. The critical details may be too numerous for the general public, but they enhance the value of the book for students. Some of the generalizations, whether sound or specious and glittering, are most forcibly presented. The following extract is, in more than one way, characteristic of the work:

"Far from advancing the religious development of Israel, Egypt only strewed obstacles and perils upon the road which God's people had to wander over. Egypt contributed the 'golden calf,' that eternal stumbling-block of the multitude; the brazen serpent, which the puritans detested; the lying oracles [Urim and Tummim]; the Levite ['ark-tender'], who became Israel's leprosy; perhaps also circumcision, the people's greatest mistake, which for a time threatened to defeat its destiny. Excepting the ark, Egypt introduced into Israel only perturbing elements, which had to be eliminated, sometimes not without a crisis. It was not thus with the notions borrowed from Chaldea. These were all fruitful, and, excepting perhaps the unpronounceable name [of the Divinity], have remained strong supports of religion. Believing mankind still lives on them, it owes to those old fables a prehistoric antiquity in which it delights, and a cosmogony of which it is proud. Israel's genius did not spring from Chaldea; but Chaldea furnished it the first ten pages of the book which has made its unparalleled success.

"Egypt, on the contrary, supplied it with few fruitful germs. And how many exquisite things it killed! The beautiful Jacobelite life is gone. Those noble types of [patriarchal] aristocrats, proud, honorable, and religiously serious, have passed away. Authority rests no longer in the hands of the tribal chief. The multitude has now a voice, and this voice will not at all be in favor of religious puritanism. The Elohim-worship will soon appear dull. On every occasion the people will longingly regret the vulgarities of Egypt, and, in order to satisfy it, it will be necessary to erect for it Apis figures with gilded horns."

CRAWFORD'S STORY OF SUMTER.

The Genesis of the Civil War: The Story of Sumter, 1860-61. By Samuel Wylie Crawford, Brevet Major-General U. S. A., A.M., M.D., LL.D. 8vo, pp. xxiv, 486. Charles L. Webster & Co.

The story of Sumter is doubtless an important chapter in the genesis of the civil war, but it is by no means the whole of it; and Gen. Crawford's method of telling the story, full of interesting matter as it is, only makes it more clearly evident how impossible it is to narrate the "genesis" without writing the full history of the United States during the period immediately preceding the war. Indeed, the war cannot be understood except by regarding it as the culmination of antagonist forces operating from the establishment of the Federal Constitution; and must, therefore, be considered as one of the closing chapters of a constitutional history conceived upon the philosophic plan which Von Holst has followed.

But even when we try to limit the field of the "genesis" to the half year immediately following Mr. Lincoln's election, as Gen. Crawford has done, we find that the progress of public sentiment in every State of the Union, from Maine to Texas, the action of political parties within those States, their legislation, the attitude of the press, the views of leading men, and many other things, help make up the current o events which swept the nation onward to its great crisis. If we confine our view to the action of Congress and of the seceding States, the attitude and influence of the border slave States, and the conduct of the Administration at Washington, we shall lack some essential elements in the critical analysis of the causes leading to the outbreak of the war, though we should still have a very large field of research.

Gen. Crawford has limited himself by still narrower lines than any of these, and by as much as he has done so necessarily falls short of an adequate grasp and presentation of the subject which is the principal title of his book. The secondary title—"The Story of Sumter"—much better indicates the scope of it, though we can readily understand that a broader title suggested itself by the accumulation of material that bore upon the general policy of the national Government and that of South Carolina. The "genesis" of the book would seem to be this: In the autumn of 1860 Gen. Crawford was an assistant surgeon in the army, and assigned to duty as medical officer in the garrison of Fort Moultrie in Charleston harbor. His zeal led him to volunteer for military duty when he was not employed as surgeon, and he took active personal part in the transfer of the little garrison to Fort Sumter, and in the defence of the latter fort by Maj. Anderson until it was surrendered to the Confederate Army under Beauregard. On his return to the North he sought military duty again, and was soon appointed Brigadier-General of Volunteers. As brigade and division commander, he served with honor in the Army of the Potomac till the close of the war. His part in the historic defence of Sumter led him to collect materials bearing upon all the events connected with it, including not only what public records and printed books and pamphlets would furnish, but what could be procured by private correspondence or conversation with prominent characters on both sides, and from their private papers. He had intimate intercourse with Judge Black, who had been a member of Buchanan's Cabinet, and valuable original documents were procured from him, as well as from Judge Holt, another member of the same Cabinet, and from private papers of Gov. Pickens of South Carolina, of Mr. Seward, of Gen. Anderson, and others.

The story of Sumter has grown out of all these sources, and is centrally the military history of the forts in and about Charleston harbor, the efforts at relieving them and their reduction by the Confederates, with the political history of the events most closely connected with the fate of the forts and their garrison. In collating the material he has collected, the author has avoided carefully—too carefully, we think—the expression of his own judgment, preferring to let the principal characters speak through their own documents and recorded conversations. The indications of quotation are not in all cases complete, and the reader is sometimes puzzled to tell whether he is following the author's own conclusions or the assertions of the original parties to the great controversy. In passing back and forth from the military narrative to political events, it has been hard to keep a smooth current and connected story; repetitions occur frequently, and the relations of things still fail to be as clear as they might be made. If the book should pass to a second edition, a careful revision might make it more satisfactory and more useful.

One of the curious things in the history of the great rebellion is the unchallenged way in which the spokesmen for the seceding States constantly assumed that nothing which was done on their side was an act of war, but that any return blow would be the beginning of hostilities—would "inaugurate civil war," to use the hackneyed phrase then current. A writer who to-day treats of those events has no need to be embarrassed with all this. The war itself settled some things by the complete assent of all intelligent men of the South. The appeal to arms, in this case as in others, was the submission of a controversy to the *ultima ratio regum*, and its decision. The secession party of the South had asserted a constitutional right on the part of each State to withdraw from the Union whenever its own judgment declared a sufficient cause to exist. The Union men of the country denied this, and asserted the nationality of the whole people in such a sense that secession was violent revolution.

We believe that every statesman of the Southern States who to-day claims to be a citizen of the United States, distinctly and unequivocally holds that this contention was decided by the war in favor of the national view, and that by virtue of such decision the national view is determined to be and is the constitutional law of the United States. We do not say that they desired such a decision; we know, on the contrary, that they fought to establish the other side of the controversy. We do not say that they were not sincere and earnest in their own contention; we know they gave every evidence of their sincerity which men can give. We do not say that they now admit that they were morally or even theoretically wrong in their position; we believe general content and even satisfaction in the constitutional decision is rapidly growing, but even this is not necessary for our conclusion, which is that they agree with us that the constitutional principle is settled. Their attitude, in short, is that of honest men who have submitted a controversy to a court of last resort; they admit that the judgment settles the law of the case, and determines that those in whose favor it is given were acting within their legal right, while those against whom it is given were not. Unscrupulous politicians at the North refuse to accept this plain basis of peace, and lay themselves out to irritate Southern men into expressions of "unrepentance" for their former action, thinking they have made cent per cent. on their political capital when they have goaded some feather-brained rhetorician into exclaiming that "the Lost Cause is not lost." We believe that judicious men of both sections of the country grieve at whatever tends to keep the calm judgment of the whole people from resting quietly upon the solid foundation for a good understanding which we have indicated.

The application of this to historical writing concerning the war is not difficult. A writer on the national side, especially if he have been a soldier, need have no fear that any sensible person will be offended if he treats his subject in accordance with the principle stated. He has the right, and it is his duty, in tracing the steps which led to the terrible conflict, to judge of each act according to settled principles. In January, 1861, South Carolina claimed to be an independent nation by virtue of steps taken in accordance with what she asserted to be rights reserved to her by the Constitution of the United States. The State officers and agents determined that the force and weight of the claim should lose nothing for lack of vehement assertion. In their anxiety to avoid strife, the officers of the United States often fell short of the clear declaration of the national claim that the ordinance of secession was revolutionary, and that the first shouldering of a musket or opening a trench was an act of war. He who writes the history now has the great advantage that

this principle is settled, and his work will be the more respected even by those who fought against it, if he logically and clearly sticks to it in his analysis of events.

There seem to have been five distinct periods of the controversy between November, 1860, and April, 1861, and as many varying attitudes of the national Administration. First, the period when avowed secessionists like Cobb and Thompson were potent influences in Buchanan's Cabinet, and when the executive conduct seemed to admit the full claim of South Carolina. Second, the period when the President theoretically denied the right of secession, but denied also the power of the Government to oppose it. Third, the period when the Administration, under the influence of Black, Holt, Stanton, and Dix, asserted the right to hold and defend the forts and other public property in the South, even if it led to flagrant war. Fourth, the opening period of Lincoln's Administration, when Mr. Seward's view prevailed, that while the right to oppose secession by force was unquestionable, it was politic to bear even with the surrender of Sumter, if by so doing the border slave States might be kept in the Union and the seceding ones possibly induced to reconsider their action. Fifth, the period immediately before the surrender of the fort, when it was determined to take all the consequences of decisive efforts to send supplies and reinforcements to the garrison.

The warlike acts of South Carolina were quite as numerous in their succession. First was the placing of State troops in charge of the United States arsenal, nominally to protect it and the public property in it; but that this was a seizure was evident from the fact that the officer in command of the forts was not allowed to take ordnance stores from the arsenal, even in the smallest quantity. Second was the seizure of Castle Pinckney by force, escalading the barred gate and making prisoners of the officer and one or two men in charge. Third was the seizure of Fort Moultrie. Fourth was the seizure of Fort Johnson. Fifth was the erection of batteries on Cummings Point and Sullivan's Island, and preparing all the forts for the attack on Sumter. Sixth, the firing on the *Star of the West* when she tried to carry in supplies and men to Sumter. Seventh, the bombardment of Sumter itself.

It seems quite clear that Major Anderson regarded all these acts as hostilities, but thought himself restrained by his orders from replying to them with his cannon, unless he should actually be attacked. His mental struggle seems to have been greatest when he saw the *Star of the West* fired upon and driven from the harbor. His military impulse was to fire upon those who were firing upon the national flag, but dread of the responsibility for the first shedding of blood restrained him. The letters and papers quoted by Gen. Crawford seem to prove that at that time Anderson believed the dissolution of the Union was an accomplished fact, and was only anxious that events which seemed inevitable might run their course without actual conflict. His personal sympathies were with the South in the political contest, yet he was determined to do his duty as a soldier with scrupulous fidelity. Hence arose a conflict in his own breast such as few men have undergone, and it is not strange that he solved his doubts in favor of avoiding bloodshed till he was actually attacked, and would have been glad to have been starved out instead of being reduced by the bombardment.

It is curious, however, to see how far even the officers of the United States had gone in yielding to the assertions of the secessionists that a shot from the Government forts would be the beginning of war, while all the military preparations for the reduction of Sumter, and even the firing upon a Government ship, were to count as peaceful. As late as the 11th of April, the day before the bombardment opened, Commander Rowan of the *Pawnee*, off the harbor, refused to sail in for the bar, for the reason that it would be "to begin civil war"; but when on the 12th he saw the flashes of the guns, he was eager to join the fray which the Confederate batteries had begun.

It is the consideration of the confused state of mind in which were so many of the responsible actors in the great drama, both civilians and military men, that makes us feel it to be the duty of the historian to clear up the muddle, and help his readers by an analysis of the events which shall leave as little doubt as possible regarding the legal and military responsibilities of either side. The new matter which Gen. Crawford has collected is most of it very valuable, and a little bolder application of the principles we have suggested would make the book wholly satisfactory as a presentation of the dramatic beginning of the great conflict.

HOWELLS'S MODERN ITALIAN POETS.

Modern Italian Poets: Essays and Versions by W. D. Howells. With portraits. Harper & Bros. 1887.

Mr. Howells's agreeable book is taken at a little less than its worth by the critics, because they regard it as a study of rather trivial literature, like those primary and secondary sonnetteers of Bettinelli who are embalmed in Sydney Smith's satire. But the book is really a chapter in the history of liberty, and the author was plainly led into this series of studies by the same generous impulse that led him—mistakenly, it may be—to petition for the life of the Chicago anarchists. The finest saying of Thomas Paine was his refusal to accept the motto *Ubi libertas, ubi patria*, on the ground that a brave man's motto should rather be "Where liberty is *not*, there is my country." When these younger Italian poets wrote, liberty did not exist in Italy; their aim was to secure it, or at least some measure of it; and Mr. Howells's first object is to give an intelligent comprehension of the work they did. We, however, find it necessary to defend his purpose not only against his critics, but against himself; for when he comes to writing his introduction he evidently distrusts his readers a little, and reverts, like so many heroes in his own novels, to an attitude of understatement and almost of *persiflage*. When he complains that, after all, political satire is not best relished in free countries, he forgets that it is but a little more than a quarter of a century since the last of the 'Biglow Papers' was written in our own; and he means, let us hope, a little more than he says, in adding, "I am not sure that literature is not as nobly employed in exciting men to heroism and martyrdom for a great cause as in the purveyance of mere intellectual delights" (p. 10). If he had not really felt sure of this, he would never have given us these three hundred and seventy pages of minor Italian poets.

Besides a little preliminary account of the "Arcadian Shepherds," Mr. Howells offers us sketches, longer or shorter, of eighteen authors, all of these being modern in the sense of dating back no further than the French Revolution. In this selection he again underrates the knowledge or the sympathy of his audience by assuming that even the best known of his poets is "scarcely more than a name to most English readers" (p. 51). Of course the majority of such readers do not read Italian, and if that is what is meant, no Italian poet is more than a name to these. In a stricter sense also, it is true that "I Quattro Poeti," though still issued in a joint volume, have long since practically shrunk into two poets, Dante and Petrarch surviving Ariosto and Tasso. But poets may be more than names, even if we do not read their verses, and the picturesque and stormy life of Alfieri was so well recorded in his own autobiography, and was, moreover, so intermingled with the English and French adventures of his time, that he is really a more distinct figure than Ariosto to most English-speaking readers. Mr. Howells has skilfully retold Alfieri's story—the essay being that prefixed to his edition of the autobiography, as reprinted in 1877; but he has relied mainly on materials already familiar. Again, in the case of Manzoni, the novel of 'I Promessi Sposi' is still one of the common Italian text-books; Leopardi's poems have just been translated, fully though somewhat prosaically, by Frederick Townsend, with a preface by O. B. Frothingham, in which Leopardi is rated quite as highly as by Mr. Howells; Silvio Pellico is still remembered for his imprisonment and his naïve narrative; and Ugo Foscolo is almost counted as a naturalized Englishman in literature, a fact to which Mr. Howells scarcely alludes. He tells us that Foscolo went to London and "gained a livelihood by teaching the Italian language and lecturing on its literature" (p. 123); but he does not tell us that he was a favorite contributor to the London reviews, through the perfection of his English style; and that his essays on Dante and Petrarch, written in English, dedicated to Lady Dacre, and published in 1823, belong almost as essentially to English literature as do the sonnets of Rossetti.

Even these comparatively unforgotten poets, however, will doubtless take a new lease of life through the friendly intervention of Mr. Howells, and his treatment of the remainder will certainly shield them, for a time at least, from oblivion throughout the English-speaking world. But in considering the mode in which this is done, it is impossible not to perceive that Mr. Howells loses by the want of that possession in which Mr. J. A. Symonds, for instance, is so strong—a classical background for his modern study. In what Mr. Symonds writes we always see modern Italy in its proper perspective as relieved and illustrated by the older Italy behind; for Mr. Howells it is simply a modern country without historic past. This makes an almost insuperable drawback to a satisfactory treatment of Alfieri, who, although avoiding the Greek and Roman classics in his youth, became more and more infused with their spirit as time went on. When, for instance, Mr. Howells analyzes the differences between Alfieri and Shakspere, he treats them simply as a personal matter, and wholly ignores the simpler solution that the one was a classicist and the other was not. Alfieri's handling of Orestes and of Fate, which was in reality a mere survival of the Greek habit of mind, is viewed by Mr. Howells (p. 95) as an individual whim, of which the whole key is lost.

But if the modern period is to be treated as something absolutely disconnected from the earlier age, no one could do it more felicitously than Mr. Howells. He sometimes pats and plays with it a little too much, and turns upon you with the sort of familiarity which he dislikes in Thackeray, as, "Is not this most charmingly done?" (p. 44)—or even in a way that verges on the slangy and journalistic, as, "I do not begin to think this is all true" (p. 69). Sometimes, also, he employs a foreign idiom, as when he says in a footnote, "Question of

Macchiavelli" (p. 119), meaning that the passage refers to that name. He has this sure merit, that he makes his book attractive; and his ventures into the field of translation have a peculiar charm. We have here the complaint to make, however, that he does not follow the usual course of Italian translators in giving the first words of the poem translated, for convenience of identification; and it is vexatious to have to look through the two hundred and fifty sonnets of our quarto Alfieri of 1809, merely to ascertain that those rendered are the 107th (*Quel tetro bronzo*) and the 167th (*Sublime specchio*). When found, the poem proves itself musically and faithfully translated, with such Howells-like felicities of phrase as "A proper nose" for *Giusto naso;* but it smacks of indolence when so skilful a master of words can hit upon no better rhymes than "mild" and "embroiled" (p. 101); and still more when we find him utterly disregarding that limited sequence of rhymes on which the Italian poets so pride themselves. The translator is right in giving us the alternate rhymes which Alfieri, unlike Petrarch, admitted; but whereas in each of these two sonnets the original has but four distinct terminations for the fourteen lines, the translator allows himself seven, and winds up, worst of all, by the Shaksperian closing couplet, which is alien to Italian verse. Mr. Howells has thus indulged himself in a far easier task than the occasion required, and one far lighter than other modern translators of sonnets exact of themselves. We regret to say that the same self-indulgence or negligence further shows itself in many lines so careless as to be almost doggerel, such as, from Fusinato (p. 365):

> "And now be shivered upon the stone here
> Till thou be free again, O lyre I bear."

This is the more to be regretted because he is capable, under sufficient effort, of very graceful and sweet translation, as in the cradle song called "Nanna" (p. 361), though even this is disfigured by such careless rhymes as "love me" with "love thee," "come" with "doom," and "abroad" with "God."

We have been thus frankly critical with Mr. Howells because he is justly called upon, as one of our acknowledged masters, to do his work thoroughly and keep to a high standard. His book, as a whole, is a most agreeable one; the publisher's part is well done; the portraits, though unattractive, are probably not more so than the Italian originals; the binding is peculiarly appropriate, and there is no serious defect except the want of an index.

Winter. From the Journal of Henry D. Thoreau. Edited by H. G. O. Blake. Boston: Houghton, Mifflin & Co. 1888.

THOREAU himself questions whether any life is rich enough to be journalized; but his editor's method, of making the whole life cover only a single natural year by selection and rearrangement, probably never occurred to him as a solution of the difficulties of triviality and monotony that make the days tedious. In the case of a growing mind such a method would hardly be applicable. Thoreau did not change much, either in himself or in his surroundings, and perhaps the type of his character is better defined by this composite-photography device of laying day upon day in the record. In this last instalment, which ends the series, he preserves his three-fold interest as an observer of nature, a man with a theory of plain living, and a writer whose mind was visited by stray thoughts. In all of these aspects he is still a noticeable figure in our literature.

The season of winter is one which he was especially fitted to report. He could not keep indoors, and by the help of skates and snow-shoes he travelled far. The New England winter, too, is a season of marvellous sky-color and snow reflection, and for color Thoreau had a sensitive and appreciative eye. Some of the scenes he gives to us are of great beauty merely for their graduated tones and hues. Of bird and plant and animal life there is little, but the lack is abundantly made up for by these broad prospects, which were his principal pleasure until the sound of running water under the snow and ice made his pulses warm with the thought of the coming spring. But, rich as the record is, it is not one which the reviewer can report.

Of Thoreau's theory of life enough has been written in the time when it was a novel thing, not in itself, but in the practical illustration he gave to it. In these entries one sees how genuinely he held it, and both what it did and what it failed to do for him. The principal value of it was that it left him time to meditate, not so much to think as to be a passive instrument of that mood when thoughts occur to the mind. Many of these are treasured in the journal; one wonders whether it was not to him what the note-book was to Emerson, a receptacle to which he had recourse in writing his books. Their literary form is clear and hard, and often they have the indefinable quality of felicities. It is singular to observe once more the wide interval between the poetry of his prose and the prose of his poetry. He had the touch of the poet now and then, but in his verse his muse was disenchanted, the fairies' gift changing at once into sticks and stones in his hands. He had some of the methods and the waiting spirit of the poet; but the message came without music. He writes: "To please our friends and relatives we turn our silver-ore into cart-loads, while we neglect to work our mines of gold, known only to ourselves, far up in the Sierras where we pulled up a bush in our mountain walk and saw the glittering treasure." This is a fine image. It is a pleasing fancy when he speaks of the ice that crystallizes about holes in the ground as "the frozen breath of the earth upon its beard." Such bits are not infrequent. There are striking sentences—"A friend in history looks like some premature soul"; and on the next page a phrase about the Greek attracts the eye: "He has left nothing unsaid, but has actually wiped his lips of it." Such examples remind us again of Thoreau's true literary faculty, the power of perfect speech. "So soon as we begin to count the cost, the cost begins," is an apothegm out of his own life. One could keep on quoting; but it is sufficient to be reminded that while such a literary gift is proved as is shown in these journals, together with such an ownership in his own thoughts, so close and full-eyed an outlook on natural beauty and such interest in the life of creation, Thoreau cannot be dismissed by a just critic as the eccentric inhabitant of a parish; he was more than that, and has had with justice more than a parochial interest to other men. Presumably this is the last of his books, and in putting it on the shelf one is quite sure that the row of volumes will be a long-remembered memorial of old New England.

Philosophy of Theism. By Borden P. Bowne. 8vo, pp. 269. Harper & Bros. 1887.

THEISTIC speculations of the present day have to contend with the universal tendency to concede that, even if the existence of God and immortality are given up, truth and duty remain the same for us as before. When it was thought that religion existed in order to be proved, or that it did not exist until it was proved, seeking for the "grounds" of truth and virtue was a very respectable calling. But we have come to see that there may be a great difference between the order of things and the order of our knowledge. Hence, metaphysical theories have only a secondary interest compared with facts. Prof. Bowne is not guilty of confusing the *ratio essendi* with the *ratio cognoscendi* of religion, nor does he pretend that men cannot be religious or moral until they have adopted a philosophy of theism. But, whatever importance he may attach to theistic beliefs, his confident and overbearing manner of argument will convert nobody to them. Lack of philosophic charity is the author's besetting sin. If this book had been written in the spirit of scorn and absurd defiance which characterizes his preface to the fifth edition of the 'Metaphysics,' we might have treated it with contempt. Although it is free from insanity, it is not wanting in self-assurance, browbeating, and the intimidation of opposing opinions. Happily the world is coming to respect a man more for his Christian treatment of views different from his own than for his sharp debating. We expect as much mercy and consideration from a philosopher as from the Deity for whose existence he may be so solicitous. Logical proofs of metaphysical doctrines are less valuable than moral character, and hence railing at a man because we have not convinced him will effect no more than stamping one's foot or kicking a stone. Calm moral sympathy for religious doubt is the first condition of effective philosophic discussion in the nineteenth century, and hence we could wish that the author had the spirit of Lotze, T. H. Green, and Martineau. Martineau is trenchant, but, nevertheless, he has a heart.

The old method of proving the existence of God by stopping with the evidence for a First Cause the author justly abandons to ignorance of the question. Hence there are mainly three topics for discussion, representing as many distinct factors in the problem: the unity of the world-ground, the world-ground as intelligent, and the world-ground as ethical. The other chapters are parts of the same theme. The statement, that theism is the only system capable of satisfying "the total interests of life," is too comprehensive to be received until we know what is going to be made of it. Of course, the author means our scientific, philosophic, moral, and religious "interests." But the conception of interest is a dangerous one to trust implicitly. It has so many ramifications that it may, at any time, shut us off into anthropomorphism in philosophy and into selfishness in ethics. Our scientific interests are satisfied by the unity of nature and the uniformity of causation, without stopping to inquire whether they imply personality or not. But in seeking to satisfy our moral and religious interests we may be prompted by something like the question: "Will God take care of us when we die?" Humanity's plaintive cry for immortality is profoundly interesting, and its belief in God may be wholly unselfish. But there is room here for motives which have nothing to do with the truth of a doctrine. The question is whether the expression of emotional instincts, which are much like "the will to live," and dangerously allied to self-interested impulses, *prove* anything.

The author would not be considered a pantheist. But the difference between this position and the one he does hold might be only one of accent. He could compromise by adopting *Pan-Theism.* He emphasizes two systems between which, it seems, our choice is to be made, theism and atheism. But there is agnosticism,

which is as positive and as dogmatic a creed as either of the others. And there is the fourth, of letting the question entirely alone. But what are you going to do with this ominous silence? You cannot argue with it, for it is irrational to pick a quarrel with a man who is peaceable and says nothing. It remains, then, as a system which adapts itself to known facts, and has neither belief, nor disbelief even, about an unknowable. Hence there is one case in which logic is not the Nemesis of Faith.

The Standard Cantatas: Their Stories, their Music, and their Composers. By George P. Upton. Chicago: A. C. McClurg. Pp. 367. 1888.

MR. UPTON has added another to his very useful musical handbooks. It is arranged on the same plan as his 'Standard Operas' and 'Standard Oratorios,' the first named of which is already in its fourth thousand. In the historic introduction he calls attention to the different senses in which the word cantata is used. He himself uses it in the widest sense, and includes in it such works as Berlioz's "Faust" and "Romeo and Juliet." In the case of the classical composers, who were very prolific in this kind of composition, only a selection could, of course, be made, and of Bach's 480 cantatas, for instance, only the four which are most frequently performed are analyzed. Besides describing the plot of the texts, Mr. Upton always calls attention to the best musical numbers, avoiding technical terms as much as possible. A large number of cantatas by American composers are included in the list.

We hope that Mr. Upton will not rest on his laurels, but will prepare another handbook that would prove very useful. Every observer of concert-hall audiences must have noted that many pay much closer attention to a piece if they know something regarding its origin and the pictorial idea that may have been in the composer's mind when he conceived it. Nor is this curiosity at all to be condemned; for the mind's eye being given some scene to fix upon, we are enabled the more easily to forget the artificial surroundings in a concert hall. Moreover, people like to talk about the pieces they have heard, and it is much easier to talk about the biography of a composition than about the music itself. Now, if Mr. Upton would select a few hundred of the symphonies, overtures, etc., etc., that are most frequently played, and explain their meaning, pictorial or biographic, with some æsthetic remarks on form and feeling, he would do a service to all concert-goers. And concert-givers would find it an advantage to get the author's permission to reprint on their programmes such of his notices as might be desirable.

Half-Hours with American History. By Charles Morris, author of 'Half-Hours with the Best American Authors.' Vol. I. Colonial America. Vol. II. Independent America. Philadelphia: J. B. Lippincott Co. 1887.

MR. MORRIS aims to present the story of the nation by selections from the works of leading historians upon the most important topics. These selections are chronologically arranged, divided into periods, and connected by brief outlines of intermediate events supplied by the author. History does not so readily lend itself to this mode of treatment as do other branches of literature, and we miss especially the continuity and unity so important to the complete presentation of a subject, and which cannot be supplied by connecting notes. On the other hand, there is value in the emphasis given by the method to events of particular importance, and in the variety of treatment. Taken in connection with some standard history, the work will also do good service by interesting its readers in the authors represented in the selections. The difficult task of culling has been executed with much skill by Mr. Morris. One is glad to find that while liberal, but not excessive, use is made of such writers as Bancroft and Parkman, local historians have not been neglected. While we must wish that more frequent use had been made of contemporary writers, yet the selections, on the whole, seem judiciously chosen for the purpose in view. The notes, which are simply condensed statements of fact, are in general correct; but the author is not entirely free from errors, as in the slip which makes him say that Alexander Hamilton was one of the defenders of popular rights at the time of the negro plot in New York. The reference is to Andrew Hamilton.

BOOKS OF THE WEEK.

Gérard de Nerval. Sylvie. Recollections of Valois. George Routledge & Sons. $4.
Goodwin, Mrs. H. B. Our Party of Four: A Story of Travel. Boston: Cupples & Hurd. $1.
Guiney, Louise Imogen: The White Sail. Boston: Ticknor & Co.
Hale, E. E. The Life of George Washington Studied Anew. G. P. Putnam's Sons. $1.75.
Hall, S. C. The Book of British Ballads. Illustrated. G. P. Putnam's Sons. $1.50.
Harrisse, H. Christophe Colomb et Savone. Verzellino et ses Memorie. Genoa: A. Donath; New York: F. W. Christern.
Harrisse, H. Le Quatrième Centenaire de la Découverte du Nouveau Monde. Genoa: Donath; New York: F. W. Christern.
Henry Ward Beecher: A Memorial. Brooklyn: Plymouth Church.
Huebsch, S. Volapük: A Guide for Learning the Universal Language. New York.
Hutton, R. H. Essays on Some of the Modern Guides of English Thought in Matters of Faith. Macmillan & Co. $1.50.
Heron-Allen, E. The Suicide of Sylvester Gray. Belford, Clarke & Co.
Hornaday, W. T. Free Rum on the Congo, and What it is Doing There. Chicago: Woman's Temperance Publication Association.
Howells, W. D. April Hopes. Harper & Brothers.
Jastrow, M. A Dictionary of the Targumim, the Talmud Babli and Yerushalmi, and the Midrashic Literature. Part II. G. P. Putnam's Sons. $2.
Jubilee and Plantation Songs, Sung by Hampton Students, Jubilee Singers, and others. Boston: Oliver Ditson & Co.
Kendall, May. Dreams to Sell. Longmans, Green & Co. $2.
Kirkup, T. An Inquiry into Socialism. Longmans, Green & Co. $1.50.
Larcom, Lucy. The Cross and the Grail. Chicago: Woman's Temperance Publication Association.

The Nation.

NEW YORK, THURSDAY, JANUARY 12, 1888.

The Week.

As regards the composition of the House committees, we think there will be general agreement that, on the whole, Mr. Carlisle has done his work well. The weakest point appears to be the Committee on Reform in the Civil Service, which is constructed too much on the principle of that famous committee on the same subject of which Mr. Blaine made Gen. Butler the leading spirit. The fact that a majority of the chairmanships go to the South, is seized upon by the bloody-shirt organs as occasion for a new howl about the Confederacy being in the saddle, but with a melancholy air which shows that they know that the country is sick of it. The South gets the majority of the chairmanships when the Democrats control the House, just as the North does when the Republicans have a majority, because the preponderance of each party's strength is in the section which thus profits. The only question with which the voters who decide elections nowadays are concerned, is whether the men are fit for the places which they get. For example, "a one-legged ex-Confederate soldier named Stone," according to the *Tribune* correspondent, has been appointed Chairman of the Committee on War Claims; but as the *Tribune* correspondent adds that "Mr. Stone is a good man," nobody whose opinion carries weight will object to him because he was once a "rebel," any more than they objected to his fellow-rebels who were appointed judges of United States courts at the South by Grant, Hayes, and Arthur.

Mr. Lamar has resigned the Secretaryship of the Interior in order to avoid the embarrassment to public business caused by the nomination of his successor, who has not yet been confirmed, "and to leave before the Senate in its final judgment upon his [my] nomination the sole question of his fitness for the position." This is a manly and straightforward act of the sort which always strengthens a public man with the people. It must also strengthen Mr. Lamar with the Senators who are to pass upon his case. There never has been any real doubt of his confirmation, and Senator Stewart's letter giving his reasons for voting that way assures such a result. Mr. Stewart's letter is an exceedingly vigorous and powerful defence of his position, and is perfectly merciless in exposing the hypocrisy and cant of the warfare which has been waged against Mr. Lamar by the bloody-shirt element in the Republican party. Mr. Stewart shows the fallacy of all the charges against Mr. Lamar on the ground that he has not loyally accepted the results of the war, and states what every candid person knows to be the exact truth when he says: "I know of no other man who bore arms against the United States in the late war who has so unreservedly accepted the verdict of arms, and so unequivocally and continuously maintained the validity of the new amendments to the Constitution, as Mr. Lamar." In short, this Republican Senator has made a complete answer to all the absurd stuff on this subject which nine-tenths of the Republican papers in the country have been printing for the past month.

"A States' Rights Opinion Given," is the headline which a Republican organ quite properly puts over the decision rendered by the Supreme Court of the United States on Monday, overruling the action of the United States Circuit Court in Nebraska, and vindicating the freedom of that State from Federal control in matters involving State questions. This "States' rights opinion," it is well to remember, was the unanimous judgment of a Supreme Court every one of whose members holds a commission signed by a Republican President. Two of these judges were appointed by Lincoln, and it is evident that they still stand upon the platform on which Lincoln was elected to the Presidency. A good many Republican editors of to-day will probably be surprised to learn that in 1860 the Republican National Convention resolved that "the maintenance inviolate of the rights of the States, and especially the right of each State to order and control its own domestic institutions according to its own judgment exclusively, is essential to that balance of power on which the perfection and endurance of our political fabric depends."

The memorial of the Bar Association of this city which has been sent to Congress, praying for an increase in the salaries of Federal judges in this State, ought to be heeded at this session, when the great problem before the members is the best way to reduce the enormous surplus. It surely cannot be claimed now that the country is not able to pay its judges salaries large enough for them to live upon respectably. No one can claim that the salaries at present paid are large enough for that. A United States District Court judge receives only $4,000 a year. A Circuit Court judge receives only $6,000, from which he is obliged to pay his own travelling expenses and private clerk hire. Compared with the salaries of New York State and city judges, this is absurdly inadequate compensation. Supreme Court judges here receive $17,500, those of the Superior Court and Common Pleas $15,000, Police Court $8,000, and Civil or District Court $6,000. When Mr. Lacombe accepted the appointment to the new Federal Circuit Judgeship, he resigned the city position of Corporation Counsel at a salary of $12,000 to take a Federal position at $6,000. This is a sacrifice which the Government ought to be ashamed to ask. More than that, the low salaries of the Federal judgeships serve as an insurmountable obstacle to most of the best legal and judicial talent of the city, because our most eminent lawyers and judges cannot afford to give up a remunerative position or a well-paid judgeship for a seat upon a bench where the remuneration does not exceed that of an ordinary clerk. Congress ought not to delay in raising the salaries to the amounts suggested by the memorialists, that is, $9,000 a year for circuit judges; for the district judges of the Northern and Eastern Districts, salaries equal to those allowed by the State to the judges of the Supreme Court outside of New York city, namely, $6,000; and for the Judge of the District Court of the Southern District of New York, in view of the cost of living in the city of New York, $7,000.

The fury of the Blaineites over Mr. Lowell's speech in Boston shows how hard its praise of Cleveland struck them—for they feel all praise of Cleveland as a stinging reflection on their own candidate—which is of course unfortunate for Mr. Lowell, as it subjects him to torrents of abuse. But this does not prevent Mr. Lowell's speech being one of the best pieces of political oratory which have been heard in the United States for many a day. The Blaineites are, in fact, so sensitive about Blaine that one can hardly speak of any other public man as honest, or truthful, or manly, or square, or upright, or accurate, or sober-minded, without rousing the worst passions of their nature. They always think this means that Blaine is wanting in these qualities, and rally round their candidate with their squirts loaded with filth. There could not be a more striking illustration of the demoralization brought by the continued prominence in politics of such a man as Blaine, than the obligation which it imposes on all his followers to vilify everybody in the community, however estimable or illustrious, who disapproves of him and his methods even so far as to be unwilling to see him in the Presidency.

Senator Allison of Iowa has been spending the vacation among his constituents, and he has found out that the "Blaine and a surplus" platform will not be accepted by Western Republicans. He told an interviewer at Dubuque last week that the necessity of revising the tariff is great, that Congress will be compelled to act, and that the party which fails to do its share in speedily reducing the tariff taxes will lose in public favor. It is rather hard on the New York *Tribune* that this outspoken declaration in favor of tariff reform, by the leading Republican Senator from the West, comes just as that paper is getting out an "Extra" containing the "Paris message."

Senator Allison condemns Mr. Blaine's policy of maintaining the surplus and distributing it among the States only by implication, but Senator Aldrich of Rhode Island comes out specifically against it. In his address to the Providence Board of Trade on Tuesday week this Republican made a very

strong argument against the plan laid down in the "Paris message." Mr. Aldrich declared that "it is substantially agreed by all parties that the revenue must be reduced," and added that "there is a general feeling among those who have made a study of the question that the annual reduction ought to be $100,000,000," although Mr. Blaine does not think that any reduction is necessary beyond the comparatively small amount involved in removing the tax upon that "necessity of to-day," tobacco. Mr. Aldrich said further upon this point, we may presume with an emphasis upon the word in italics: "I know of no *intelligent* protectionist or Republican who is not in favor of reducing the annual revenue to such a sum as shall be required to meet the current expenses and the maturing obligations of the Government." As for the Blaine plan of annually dividing a great surplus revenue among the States for the benefit of a particular class of taxpayers, Mr. Aldrich contemptuously remarked: "None of the propositions to collect a revenue with a view of dividing it among the States, or distributing it by extraordinary expenditures, are in my opinion defensible."

The strike of the coal-miners of the Reading Coal and Iron Company is connected, in the imaginations of the Knights of Labor, with the strike of a portion of the employees of the Reading Railroad Company. The strike of the railroad hands, it will be remembered, grew out of the refusal of the crews of five freight trains to handle cars loaded with flour taken from a warehouse that was operated by non-union men. The Superintendent of the railroad company promptly discharged the five crews and filled their places with non-union men. There had been a similar difficulty brewing for some time among the coal-handlers at Port Richmond and Elizabethport regarding "scab coal" from the Lehigh region, where a strike was going on in which the Reading Company had no concern except as carriers of coal mined by other companies and firms. A strike was ordered all along the line when the five crews were discharged, but it was only obeyed in part, and a conference was held between the Superintendent and the leaders of the Knights of Labor, in which it was agreed that the five crews and the two leaders who had incited them to mutiny should be definitely discharged, and that all strikers who reported for duty at twelve o'clock on the next day should be re-employed if their places had not been filled in the meantime. The Knights affirm that there was a further understanding that the original difficulty growing out of the refusal of the five crews to handle non-union flour should be submitted to arbitration; but there is no evidence of any such agreement, but on the contrary every reason to doubt it, since the laws of the State and of the United States expressly require railroad companies to carry all freight offered, in its turn, without discrimination or favoritism.

The strike of the coal miners is a different matter altogether. This is a question of wages entirely. The granting of the 8 per cent. advance, or the refusal to grant it, involves no question of principle, or of law or charter requirements, or of discipline. The company had an agreement with the miners that they would continue the 8 per cent. advance after the 1st of January if the same advance was granted in the Lehigh region. The miners agreed to go back to the old wages if the advance was not agreed to in the Lehigh region. As a matter of fact the advance was not granted to the Lehigh miners. Therefore, logically, the Reading men were bound to go to work at the old rate on the 1st of January. But miners are not very logical, and indeed it does not make much difference whether they work a few days or a month at the old wages, and then strike again, or whether they simply break the agreement. The agreement did not require them to work at the old wages for any specified time, although the implication was that their strike was contingent on the Lehigh strike, and was to follow the fate of the latter. There is no reason, therefore, why the miners' strike should not be submitted to arbitration if the Reading Company see fit to do so. But no arbitration or private settlement of that strike can be made to hinge upon the freight-handlers' strike of the Reading Railroad employees. The same reasons which forbade any submission to arbitration of the company's right and duty to carry all goods offered promptly and without discrimination in the first instance, forbid it now. The correlative right and duty to discharge hands who refuse to obey orders, and to employ others, remains unaffected by anything happening or that may happen in the coal region.

An interview with Gen. Sickles, the new Chairman of the State Civil-Service Commission, shows that his intentions are excellent, but also that he has paid but little attention to the working of the competitive system. There is no surer sign of a man's ignorance about it in this State than his belief that the examinations are not practical. Gen. Sickles apparently holds this belief, and in support of it cites the case of a

> "young man who applied for a position in which a knowledge of chemistry and metallurgy was absolutely necessary. He was a graduate of one of the scientific schools, and was a man of considerable repute in chemistry and metallurgy. He went up for examination, and was asked all sorts of questions in a two hours' examination on all sorts of things, but was not asked a single one about the subject of chemistry and metallurgy."

This looks very startling, but the explanation of it is probably the same as the explanation of the puzzling story told by "the boy" about the complicated relationships in his own family: the "young man" lied. We venture to assert that no such examination ever took place. Stories of this sort are frequently told by defeated candidates to excuse their failure to their friends, but they are never brought to the notice of anybody who can investigate them. Gen. Sickles's account of the way the examinations ought to be conducted, in his opinion, shows also that he has still to make himself acquainted with the way they are conducted. For instance, he recommends that the police examinations should be conducted by "such a man as Inspector Dilks," not knowing that they are conducted by a better man than Inspector Dilks, namely, Inspector Byrnes; and he recommends the "same method in the Fire Department," not knowing that the examinations there are conducted by Chief Bonner. His further remark, "that the place of a mechanic should be filled by a mechanic, and not by a college graduate with a smattering of knowledge of the work to be done, we must in common politeness take to be a recommendation, and not an empty platitude; but as such it shows that Gen. Sickles is still in the state of mind which was very common four or five years ago, when there was so much hostility in political circles to examining candidates "touching the height of the walls of Khartum and the depth of the Polar Sea."

Gen. Sickles's want of knowledge of the system is very likely shared by his colleagues, which makes it seem unfortunate that they should so soon have got rid of the Chief Examiner, Mr. Potts. Their first official act was to dismiss him, as he was an object of special animosity, we believe, to the Governor, who was extremely annoyed at his being put in a salaried office by a commission which he (the Governor) looked on as moribund, without consulting him. The offence was aggravated, too, by the fact that Mr. Potts had been secretary of that odious body, the Civil-Service Reform Association. But none the less Mr. Potts was a most efficient officer, thoroughly familiar with all the duties of his place, and, as any man filling it ought to be, eagerly sympathetic with the system he was called on to administer. If the new Commissioners had kept him in his place until they had thoroughly familiarized themselves with their new duties, they would, in our opinion, have done a very wise thing.

New Hampshire is beginning to doubt whether its new insurance policy pays. It will be remembered that two years ago last summer the Legislature passed the "Valued Policy Law," which required an insurance company in case of total loss by fire to pay the entire amount of the policy without regard to the loss actually incurred. All the foreign companies withdrew from the State. Appeals were made to State pride, and a number of local companies were started. For a few months things went well, but last year brought losses of over $2,000,000, which is more than double the average for the last ten years; and one of the strongest of the new local companies, the New Hampshire Manufacturers' Mutual, which carried risks of $800,000, has just been forced into liquidation, while several other companies are reported to be in a rather shaky condition. "What do we care for abroad?" is not so popular a remark in New Hampshire now as it was two years ago.

It is now announced authoritatively by the London *Lancet* that the affection of the throat from which the German Crown Prince is suf-

fering is not cancer, but "a severe form of chronic laryngitis," and that the condition of the throat has completely changed. The news, we are sure, will be received with the heartiest satisfaction throughout the world. There is no royal personage who has so strong a hold on the respect or affection of men of all civilized communities, or whose removal just now would be so great a misfortune, both for his own and other European countries. The way, too, in which he has borne the belief, for many weeks, that he was threatened with a lingering death of the most horrible kind, has been a splendid example of courage and fortitude. As long as he lives and can perform the duties of the place which awaits him, the future of the German Empire may be considered secure, and it will be a future of peaceful progress, both political and industrial. Moreover, in a few years more the military ardor of Prince Wilhelm, the next heir, will have been cooled by time and experience of life.

The Pope's Jubilee has not brought about, as some people supposed it would, a reconciliation between the Vatican and the Quirinal, as the phrase is, or, in other words, reconciled Leo XIII. to the loss of the temporal power. So far is he from this that he returned the King's presents the other day in a somewhat uncourteous way. We are sorry to add that the prospects of a settlement are still further darkened by the uncompromising attitude on the subject of the temporal power of some Catholics in this city, and notably of Mr. Bourke Cockran, who has set his face like flint against home rule for the Romans. He is apparently opposed to the kingdom of Italy as at present constituted, and insists on the surrender of the capital and a piece of the adjoining territory to the Pope and the Cardinals. We feel sure that Mr. Cockran, however, will some day relent, and let the Italians have their metropolis in peace, but we do not see how the Pope ever can. No Pope will be willing to go down in history as the one who gave up the claim of the Papacy to the States of the Church. Consequently, every Pope will for an indefinite period, as a matter of form, continue to put himself on record as complaining of being kept out of them. This does no harm to any body, and saves all rights. No claim of this kind is ever relinquished in a short time. It is only seventeen years since the Pope lost Rome. It is one hundred years, to all intents and purposes, since the Bourbons lost Paris, and they are claiming it still vigorously. The Stuarts, too, claimed London down to the beginning of this century, or until the line became extinct. If the Papal claim to Rome be abandoned within 150 years, those who witness it will be greatly surprised. In the meantime, however, the restoration of the temporal power is about as likely as the restoration of the Holy Roman Empire. The great argument that the Church cannot get on without it, even with the help of God Almighty, will, however, yearly become a little more hollow. In forty or fifty years it will become ridiculous even to the most pious believers. It is always dangerous to argue that you cannot live without a thing which you cannot have, because you are liable sooner or later to have to decide whether you will die or be reduced to absurdity.

The French Government, curiously enough, considering what a part women in France play in the retail trade, has only recently begun to employ them in the public offices. It has now about 6,000 in the postal and telegraphic service, to which they are admitted after a competitive examination which has to be pretty severe, owing to the large number of applicants—from five to ten for every vacancy, although the salary is wretchedly small. It takes long years of service to reach the maximum of $300. M. George Michel discusses the working of the experiment in the last number of the *Économiste Français*, and gives some interesting details about its conditions. The office hours of the women are from ten to five, and they are rigidly confined to one portion of the building, which no man is allowed to enter except the higher officers of the department. They are furnished by the Government with a hot lunch in the building, or breakfast, as they call it, at from ten to fifteen cents, from a kitchen established for the purpose. No letters are allowed to be delivered to them in the office. All letters addressed to them there are sent to their homes. As to the quality of the service rendered by the women, what their superiors say is, that they are far superior to the men in everything which calls for manual dexterity. In sending despatches, classifying bonds and coupons, verifying and sorting postal orders, and in the keeping of accounts, their superiority is incontestable. M. Michel says: "They discover errors with that sureness of sight which belongs to women accustomed to count the points of a piece of tapestry or the threads of a piece of linen to be marked. They also give very close attention to the copying and the verification of tables of figures. But as soon as the work ceases to be in some sort manual, their superiority disappears in most cases. They cannot follow up a correspondence or extract the essence of a transaction from a bundle of papers. Their turn of mind rebels against this sort of work; it loses itself in details."

The length to which "realism in art" has been pushed by a certain school of French littérateurs has brought so much reproach on the French nation that a "League" has been formed for the "Elevation of Public Morality," in "the interest of democracy and of the honor of the national genius." "The question is," its promoters say, "the frightful spread of immoral and demoralizing literature." What has brought about this crisis is probably Zola's latest effort, which is having an immense sale, and is probably the filthiest and most disgusting product of the human mind either in ancient or modern times. A lecture has just been delivered, under the auspices of the League, by M. Pressensé, one of the Senators, at Lyons, in which he draws a terrible picture of the condition of French light literature; but this, as the *Temps* points out, is a comparatively easy thing to do. What is needed is a remedy, and the suggestions made on this point are not very valuable. One writer, M. Loliée, in a book on 'Literary Men' (*Gens de Lettres*), says the cause of the evil is that whereas writers used to be amateurs who never expected to make money out of their books, they are now professionals who want to make all the money they can, and manufacture whatever they find will sell best. This may be an explanation, but it is not a cure. The *Temps* says that the only way to abate the nuisances is to induce "the public to become disgusted with the products which are furnished to it, instead of eagerly buying them," but this does not differ greatly from the plan of getting the Legislature to ordain virtue, at which the same journal laughs. The fact is, that both filthy books and filthy newspapers owe their prosperity to the existence and rapid growth in all countries of an immense public which has acquired the art of reading without any intellectual tastes or culture, and therefore seeks from the types simple entertainment of any kind. He would be a very wise man who could tell how this class is to be cut off from what it finds the cheapest form of excitement.

The promised explanation by the Mexican Government of the newspaper charges brought against it in connection with the colonization of Lower California mingles confession with denial. It fully disposes of the charge of secret and underhand methods, easily showing that all the contracts involved had been long since published. It also makes the alarm over the alleged number of American settlers look rather ridiculous, by showing that of the 1,600 colonists recently introduced into the Territory, not more than 200 are citizens of the United States, while the total population is upwards of 34,000. This estimate, however, makes no account of the foreigners who are in Lower California, not as settlers, but as adventurers, explorers, holders of contracts and laborers under them. There seems to be no way of getting at the numbers of these accurately, but it is generally admitted that they would foot up many more than the regular colonists. The Government argues strongly for the positive advantages wrought for Mexico by the development of the Territory under the present policy, instancing the new Custom-house established at Santa Rosalia purely in consequence of the growing trade, from which a revenue of $90,000 has already been produced. Secretary Pacheco tacitly admits that the law preventing alienation of land within twenty leagues of the frontier has been violated, but justifies this by saying that the law has become ridiculous with the introduction of railroads, since a hundred leagues mean less now than twenty did formerly. He also refers at great length to the circumstances attending the annexation of Texas, arguing that the situation in Lower California is entirely different, and that, moreover, the attitude of the United States towards annexation is wholly unlike what it was half a century ago.

SENATOR SHERMAN'S SPEECH.

Our Washington advices state that Senator Sherman's speech is to be taken as an indication of the Republican policy of dealing with the surplus. We think that there is good reason for this opinion. In the first place, Mr. Sherman is and has long been the leader of the party on that class of questions. He has had more experience in dealing with them than any other member. He understands the principles of finance better than any other. He is immeasurably the superior of Blaine in this regard. He is quite as skilful as the author of the "Paris message" in presenting surface arguments when they serve his purpose, but he sees much further below the surface, and accordingly knows much better what the wearing qualities of a sophism are if it becomes necessary to use it. It is thus, by virtue of a better training, that he has kept clear of Mr. Blaine's plan to divide the whiskey tax among the States—a proposition which has fallen upon the public opinion as flat and motionless as a ball of putty against a pavement.

Mr. Sherman has steered clear, also, of the fantastic proposition to abolish the whole internal-revenue system. He goes no further in this direction than the repeal of the tobacco tax and the special taxes (amounting to $5,200,000) on rectifiers, etc., of distilled spirits. "The taxes on beer and spirits," he says, "might be so modified that the States could make taxes on the consumption of those articles a bounteous source of revenue and a proper means of relief from the burdens of local taxation." This is a very different thing from advocating the repeal of all internal-revenue taxes. It proves conclusively that the Republican party is not prepared to enter the next campaign bearing the odium of free whiskey while sugar and salt, for example, remain taxed nearly 100 per cent. ad valorem.

But the surplus must be got rid of somehow, and those who object to the President's methods must show better ones. Mr. Sherman suggests rather than recommends extra liberality in appropriations as a means of getting money out of the Treasury. He says that *if* the President had signed the River and Harbor Bill, *if* he had not vetoed the Pauper Pension Bill, *if* the House had voted for a suitable coast-defence bill and a proper increase of the navy and the "Bill to Promote Mendicancy," and, finally, *if* the Secretary of the Treasury had gone on resolutely buying bonds in the face of an advancing premium, we should not now have the surplus problem in its present aggravated state. Undoubtedly there may be found ways to spend all the money that can be raised by any system of taxation. Most of us would be willing to take some. But it requires courage to advocate public extravagance before a people who have been all their lives practising economy in private, because they were compelled by dire necessity to do so. Mr. Sherman comes just short of saying that he would enlarge the expenses of the Government to the magnitude of the surplus, but what he says on this point is sufficient to give President Cleveland a very fair start in the next campaign, because what he does say is a public announcement that the Administration has been economical of the people's money. Since party contests began in this country, the claim of economy by the ins and the charge of extravagance by the outs have constituted the chief part of our political diet. The time has not yet come when this rule can be changed. We look upon this as the weakest part of Mr. Sherman's speech, and we shall be surprised if the Democrats do not make him repent that he ever helped them to prove to the people that they have been careful in husbanding the public resources, and that they have avoided as far as possible the payment of high premiums to bondholders.

Mr. Sherman proposes a reduction of the sugar duties. This is the only protective tax that he consents to abandon, and he allows this only on condition of granting a bounty to the American producer of the article. It will be a novel experience—this payment of bounties out of the Treasury to persons engaged in a particular industry. If this policy is adopted in reference to sugar, it follows that every other industry which is, or says that it is, put to disadvantage by tariff changes, must be fed with the same spoon. The wool-growers have not ceased to declare that they were damnified to the extent of millions by the slight reduction of the tariff on wool made in 1883. If sugar is to have a bounty, why not wool, and why not everything that can show that it is suffering from those "inequalities of the tariff" which the Republican party is pledged in its last national platform to rectify? We advise all parties to beware of bounties.

THE TAXES ON TOBACCO.

We were not aware until very recently that the tax on domestic cigars is a part of the general system of "fostering" American industry. We use the word fostering, instead of protecting, because it is used by the *United States Tobacco Journal*, from which we derive this valuable information. We are always sceptical about the promotion of industry by taxation. The fostering care of a government which levies any percentage of tax over and above the plain needs of the public treasury, looks to us like the diversion of the lawful earnings of one person to the pocket of another, the more especially since the Government has no occult resources of its own, but can only disburse or distribute what it has first collected from the people. This reasoning is commonly held to be sound and unanswerable until you apply it to the consumers of imported goods. Latterly there has been an extension of the principle to butter, the doctrine being that this article should be "fostered" by a tax on oleomargarine, although both are American products.

Far otherwise has the fostering care of the Government been exercised in the cigar industry, which, as the *Tobacco Journal* assures us, has been stimulated not by taxing any other industry, domestic or foreign, but by taxing that industry itself. This is proved by statistics and the history of the trade. In 1860 the capital invested in the manufacture of cigars was $3,035,555. It gave employment to 7,997 persons, whose wages amounted to $2,531,354. The population of the country was 31,000,000. But between 1860 and 1870, when the tax was the heaviest and Government interference the strictest and most vexatious, the capital invested in cigar-making quadrupled, the population of the country having risen only to 38,000,000, an increase of only 24 per cent., against an increase of 400 per cent. in cigar-making. The number of persons employed rose in this period to upwards of 26,000, an increase of more than 300 per cent. In the next succeeding decade the cigar industry grew to $21,698,549 of capital invested and to 53,297 in the number of persons employed, or about 100 per cent., while the population increased only 35 per cent.

"What do these figures prove?" asks the *Tobacco Journal*. Why, that the internal-revenue cigar tax "fostered the cigar industry to a marvellous growth, and that while its repeal will not benefit the consumers in the least, it may expose the industry to the same injurious and deadening influences which hampered its growth before the war." The conclusion of our tobacco contemporary is, that "the best policy would, therefore, appear to be to leave well enough alone, particularly if the repeal of the tax is opposed by an overwhelming majority of the manufacturers themselves and all the wage-earners in the industry." Then a suggestion is made that both the consumer and the manufacturer would be benefited by the removal of the duty on raw leaf. There can, in fact, be no doubt that this important branch of American industry would be greatly promoted by the repeal of the duty on imported leaf, which has recently been increased to the shocking rate of 75 cents per pound (the former rate being 35 cents), in order to protect a few growers in the Connecticut Valley.

We cannot help feeling puzzled to find a particular industry calling for internal-revenue taxes on itself, and we should catalogue this fact among the other insoluble oddities of our financial situation—the surplus and the dreadful stew about getting rid of it—did we not remember that we heard the same outcry when the tax on matches was about to be knocked off. The match manufacturers wanted the tax retained. Why? Because it required more capital to go into the business while there was a tax on the article, and thus the trade was kept select, being in some sort a close corporation. We do not know whether this is the situation of the cigar trade, but we note it as a question worth looking into by Congress, why cigar manufacturers should want to pay the Government $3 per thousand on their output, and should be distressed that the Government does not want the money. Unquestionably there has been an immense increase in the cigar industry since the year 1860, by far greater than the increase of population. But since common sense refuses to believe that this increase has been caused by the tax on domestic cigars, we are driven to the conclusion that smokers now use cigars who formerly used pipes, just as they now use refined sugar where they formerly used brown sugar. These are

merely signs of the increasing wealth of the country.

The taxes on tobacco and its products are of several kinds. Manufactured tobacco and snuff are taxed 8 cents per pound, cigars $3 per 1,000, and cigarettes 50 cents per 1,000. In addition to these taxes the manufacturers, dealers, and peddlers of cigars, tobacco, and snuff pay special taxes or license fees which amounted in the last fiscal year to $1,430,919. The total internal revenue from tobacco and the tobacco trade was $30,108,067, of which domestic cigars and cigarettes yielded a little more than $12,000,000. The *Tobacco Journal* insists that the repeal of the cigar tax would not benefit the consumer, because the cheapening of the article would be only one-third of a cent, "a fraction of currency which has no real existence." Possibly this difficulty might be got around by buying three at a time; but if it were insurmountable, the cigar-makers might as well pocket the $12,000,000, seeing that the Government does not want it and is embarrassed by having it. Can they not manage somehow to make their disbursements equal to their receipts? Are they, too, troubled with a surplus?

A few words of reply are due to a valued correspondent who writes to protest, on free-trade grounds, against our position in reference to the tobacco taxes. The difference between us is primarily this: We consider the surplus a greater evil than protective duties. He considers protective duties a greater evil than the surplus. Holding the view that the surplus is extremely menacing to all business interests, and most demoralizing in its incentives towards extravagance in appropriations, and that it is a new evil that may be killed now by common consent, while protection is an old one that can be killed only by slow degrees through the spread of education—for these reasons and for others which we need not repeat, we favor the repeal of the tobacco taxes as one of the measures for reducing the surplus.

SUCCESSFUL ANTI-LIQUOR LAWS.

THE statement which Gov. McGill of Minnesota has made concerning the effects of the new High-License Law in that State furnishes valuable corroborative evidence of the practical wisdom of this method of fighting the liquor evil. He tells the same story that has been told of every State in which high-license or tax laws have gone into effect, namely, a large decrease in the number of saloons, a perceptible diminution in the amount of drunkenness, and a great increase in revenues to the local and State treasuries. The Governor says there has been a total reduction of over 1,600 in the number of saloons in the State, and that "while the effects of the law with regard to the diminution of drunkenness must naturally be of a more or less speculative determination, still there are many facts which plainly warrant an inference that there is much less than before the law went into operation." He then quotes the following interesting and valuable opinion by Bishop Ireland, who, he truthfully says, is probably better able to judge of the general effect of the law with respect to drunkenness than anybody else in the State:

"In Winona there is a very large Polish population, perhaps 800 families, mainly composed of mill hands, and formerly there was a good deal of intemperance among them. There is now but one saloon in Winona, instead of eight or ten, and the bank deposits of the Polish people are unusually large. Caledonia, Houston County, was formerly composed of a large drinking population. Now there are but four saloons where there were formerly fifteen. In many of the smaller places drunkenness has disappeared altogether. Kilkenny, formerly a constant source of disorder, is now one of the quietest villages in the State. All classes of people are pleased, Germans, Polanders, and French, all through the country. If there was a popular vote to-day as to high license in Minnesota, the majority would be overwhelmingly in its favor. It is a solution of the temperance question. Its benefits are already appreciated by the people, and it would be impossible to change the High-License Law of Minnesota to-day. The financial feature of the Minnesota law is one of its many admirable features."

This is testimony of the highest value. It coincides perfectly with a letter recently published in the *Evening Post* about the effect of the law in Caledonia, one of the places mentioned by the Bishop. The writer of it stated that the effect of the law in that village had been to reduce the number of saloons from fifteen to four, to diminish drinking and drunkenness, to keep all saloons closed on Sundays, and to increase the revenues so that improvements of the streets had commenced. He concluded by saying, as Bishop Ireland does, that public sentiment was overwhelmingly in favor of the law, and added: "It is an unmixed good." The Bishop says: "It is the solution of the temperance question."

Simultaneously with this news from Minnesota comes a detailed statement, put forth by the Local-Option League of Ohio, giving the latest figures concerning the working of the tax law in that State. License is forbidden by the Ohio Constitution, but the effects of license are secured by a law which levies a tax of $200 upon all full liquor stores and of $100 upon beer-saloons, and permits any community, by means of a local-option clause, to regulate, restrain, or prohibit the sale to suit itself. According to the Local-Option League the net results of this law to date are as follows:

"(1.) Two thousand and eighty-eight saloons have been closed by the saloon-tax provision.

"(2.) Five hundred and seventeen saloons have been closed by Town Councils, most of them by vote of the people.

"(3.) Two hundred towns in the State have adopted local option and suppressed the liquor traffic to a greater or less extent, and the number of towns taking this stand is increasing.

"(4.) Nearly $2,000,000 has been collected of the saloon men and put into city and county treasuries."

In order to get the effect of cumulative evidence, let us place beside this testimony from Minnesota and Ohio the latest official data about the effects of similar laws in other Western States. In Illinois there is a uniform tax of $500 upon liquor-selling. The law provides for two licenses, $500 upon liquor-selling and $150 upon beer-selling, but the local authorities have found it advisable in nearly all cases to use the privilege given them to make the tax a uniform one of $500 upon all kinds of saloons. The total effects of the law have been to reduce the number of saloons in the State from 13,000 to 9,000, to increase the revenues from the traffic from $700,000 to over $4,500,000, and to decrease perceptibly the amount of drunkenness and crime. In Chicago alone there are now 3,900 saloons, against about 4,000 before the law went into operation, notwithstanding the great increase of population, which would have warranted, under the ratio of the old law, at least 6,000 to-day, and the revenues have increased from $200,000 a year to nearly $2,000,000.

In Missouri, where the minimum license fee is $550 and the maximum $1,200, the number of saloons has been reduced about one-fifth, and the revenues raised from less than $600,000 to nearly $2,000,000. Under a local-option law, which is separate from the license law, and which has recently been declared constitutional by the Supreme Court of the State, thirty-four counties and eleven cities have established prohibition by popular vote. In Michigan there has been a tax law in operation since 1875—last year made more stringent, we believe, by raising the tax from $500 to $800 upon every wholesale dealer and from $300 to $500 upon every retail dealer. At the last session of the Legislature a local-option law was passed under which a large number of counties have voted in favor of prohibition. The effect of the two laws together has been to cut down the number of saloons to less than 5,000 in the State—about one-half of what they would number on the ratio of saloons to population under the prohibitory law which was in force previous to 1875, and to give the State an annual revenue of nearly $9,000,000. In Nebraska, where the license is $1,000 in cities and $500 in all smaller places, the number of saloons in Omaha has been reduced nearly one-half, drunkenness has been greatly diminished, and the revenue has been increased from $50,000 to nearly $250,000. Similar results have been obtained in other portions of the State.

Can anything like these results be shown from prohibitory laws? Is there a single State where there is a prohibitory law on the statute-books in which it can be affirmed that the liquor evil is restricted to anything like the extent shown by the statistics given above? If so, we are not aware of it. Only a few months ago the Prohibition organ, the *Voice*, published several columns of letters from persons in Maine about the working of the prohibitory law there, and the admission was frankly made in all of them that in all the large cities of Maine—Bangor, Portland, Lewiston—the law was not enforced at all. "With one voice," said the editor of the paper in summing up the Bangor portion of these letters, "they declare that the prohibitory law in Bangor is a farce and a fraud." The same charge was made about other cities, and was sustained by ample evidence, and the excuse made was not that the law was a failure, but that the Republican officials would not enforce it for political reasons. The same state of things exists in Rhode Island, where the law is systematically violated in nearly or quite all parts of the State. In Vermont it has never succeeded in keeping saloons closed, and in Iowa and Kansas there has been a similar

failure. Saloons exist in large numbers in all these so-called prohibition States, and there is no revenue whatever from them.

In fact, there has been no form of legislation in recent years which has proved so successful in actual experiment as these high-license laws. They do accomplish the most important purposes of restricting the traffic, keeping it within bounds wherein it can be regulated and controlled, and reducing the evils which flow from it. It is the one form of legislation which the liquor interests most fear, and for excellent reasons. We ought to have such a law in this State, and if the present Legislature does its duty, the responsibility of preventing us from having it will be put squarely upon the Governor's shoulders.

FROM TRIPOLI TO ALEXANDRIA.

ROME, December 21, 1887.

COMING from the French possessions in Algeria and Tunis to Tripoli is a change from tolerably well-ordered countries to a narrow strip of fertile, poorly-cultivated land, with Turkish rule and garrisons, an unhealthy and, for a great part of the year, very hot climate. Mirages are common, and have often deceived mariners on the inhospitable and poorly charted and lighted coast. From the mountains and fertile plains of the northern part to the arid deserts and flat coast-land of Tripoli—the Sahara being but two miles inland from the city—is indeed an extreme change, and the older order of things obtains, with all the evils of Moslem misrule, wretchedness, and neglect. The few oases within travelling distance send their products to the weekly market, and these consist of barley, dates, rough cloths and carpets, cattle, horses, chillies, some fruits, grasses, and melons. It is stated that gold dust is brought in also. Formerly the slave-trade was prominent here, and caravans with slaves from the interior were the chief source of trade and activity.

The garrison, besides occupying the citadel, were encamped without the walls, on the right, in the public gardens, to the number of two thousand. There is some apprehension regarding the aims of Italy in this quarter, and these troops—at their present strength—have not been here long. Two well-armed men-of-war were also in the harbor, and the fortification mounts a few large Krupp guns besides the considerable number of ordinary cannon. The walls are much worn and decaying, but they are manned; sentinels are posted at all points, and visitors are not permitted to go near them. Two large schools were visited at 7 A.M., and were full of all classes of scholars—adults as well as boys—studying aloud. The morning hours are not neglected by any portion of the community; trade was brisk, and none were abed. The population consisted of the usual Jewish traders and merchants, very many negroes from the interior, a few Europeans—Maltese, Italians, and French—and the larger part Bedouins. The Turks number not over a sixth of the inhabitants. A large number of the Arabs are Tunisian, and appear to be rather a hard lot, freely reviling the foreigner upon sight. Since the French occupation of Tunis, these Arabs come into Tripoli, and are said to be a little troublesome. They pitch their tents near the city.

For pure sightseeing of Arabs—their mode of life, productions, trading capacities, and characteristics—Tripoli offers better facilities than any other northern African port. I saw great heaps of their staples—grain, dates, and chillies—and vast numbers of camels, horses, and some cattle. Well-bred and blooded colts of four or five months were priced at from two to four English pounds, and they were exquisitely beautiful. Cloths and carpets of coarse make and fibre were strewn about for several hundred yards, and were mainly of wool. Barley and dates exceeded all other displays, and the space occupied by the market was certainly a half mile long by a quarter wide. The scene was unique; there were money-changers and story-tellers, musicians and armorers, the rich, fat Jew and the haughty, well-to-do Arab, with servants of both sexes, black as Erebus, a mingling of costumes and colors, flowing white burnooses, and head-gear of all the northern African races. Ears, necks, noses, arms, and ankles of the Arabs loaded with jewelry; hidden faces, tattooed skins, the lame and the sick—all were there, and rarely a European. The sun beat down, and there were no tents; the season was declining; October was at hand, and the thermometer (F.) was at 95°.

There is no American consular officer here. The bazaars offer nothing unusual, but they are large, roomy structures, and with few exceptions are occupied by the Jews. The principal stocks are cotton, silks, carpets, embroideries, and European fancy articles, smokers' materials, fezes, arms, perfumes, and so on. There is no good accommodation for travellers, and the tourist coming to Tripoli must rough it—must accept poor fare and many strange bedfellows. The streets are merely lanes, foul and ill-smelling to the last degree, and there is no cleanliness. Sheep are killed at any convenient wall, and the meat sold on the spot; offal is left for dogs—too few for the purpose—and one meets everywhere heaps of garbage and refuse. Eye diseases and poorly nourished children are common. The best element of Tripoli seemed to me to be the nomadic Arabs. They at least appear clean, and, with their fine faces, tall figures, and haughty bearing, their quaint arms, their pure white flowing costume, incessantly going and coming, on camel or horse, they have a striking individuality.

There is no way of ascertaining the volume of trade accurately, and though it may not be as large as formerly in the days of slave-selling and the great caravans from the far interior, it is nevertheless considerable and mainly local. Of course there are no docks, and all loading and discharging of steamers is done by large boats and lighters. Labor is cheap as well as human life. With the extinction of piracy and slavery, and the decline of the power of the reigning chiefs—from this last cause more than anything else—Tripoli as well as Tunis soon took an inferior place and is now rarely heard of in a material sense. There does not appear to be much to attract foreign conquest, and if it is asserted that Algeria is a drain on the French treasury, it is inconceivable that Tripoli could ever support for any length of time a European force. It is an unhealthy country, and the few square miles of fertile coast land in the immediate vicinity of the capital offers the choicest part of the country. It is probably hotter than Egypt, with the desert a few miles away on three sides, and the relative humidity is extreme.

From Tripoli to Egypt is an agreeable change, but before reaching Alexandria there are days of scorching heat and blistering sun, steaming along the arid northern coast. The first impression one forms of Egypt at the present time is, that a struggle is going on between many forces, and that this fair country may not after all emerge from the condition of servitude and chaos she has been in for so many years. Few people can successfully deny the benefit Egypt is deriving from the English control. For the first time in ages the "fellah" or producer in this land gets a receipt for his annual tax payments, and he seems to be correspondingly happy and industrious over it. Formerly taxes were wrung from him as long as his money and worldly goods held out—often with the lash—and as often as two and three times in the year. One sees great quantities of cotton on the wharves, and much evidence of a large trade in Alexandria, while from the ruins of the old city is rising a vast, and in many parts an elegant, metropolis. Alexandria promises to be again a great city, and in the building activity one is reminded of a growing Western city in our own country. It is now estimated that the population is 250,000, and plans for the entire building of several new sections of the city are in progress. The English garrison are rarely seen, though they have two large buildings in the heart of the city, and occupy a commanding fortification in the old citadel, near the railway station, besides an encampment a few miles out, near the remains of the Khedive's unfinished summer palace. Without going into the question, one becomes impressed with the fact of the solid benefits of English control. During a visit to Egypt in 1881, I formed some idea of the order of things and the management of affairs then, and, coming now again, there seems to be a change for the better, though I should hesitate to state why. Notwithstanding a feeling of insecurity, which is quite general, the workers in the country are probably gaining a better spirit, there is more production, more industry, and less fear of a summary and brutal official and military class in government.

There is now prevailing at Cairo a form of fever, of malarial type, sometimes with a continuous or typhoid tendency engrafted on it, in all probability due to the excessive height and overflow of the Nile, and the consequent stagnant pools of water, decaying vegetable matter, and the formation of specific miasms. The mortality is reported as very low. The disease is, however, very general, and will in all likelihood unfavorably influence the coming season for tourists, as strangers to the country seem to be especially prone to experience an attack. In some cases symptoms of joint involvement and deep-seated pains are noted, and hence unusual reports of dengue and "break-bone fever" are in circulation, but there is an absence of the chronicity and serious sequelæ usually attendant on dengue.

In the older and strictly native portions of Alexandria the old order of things still obtains, and one winds through miserably kept streets, wooden bazaars, by heaps of garbage and refuse, and other annoying nuisances made more potent by the heat. As usual in the East, the Jews seem to have the bulk of the trade, and the money to do it with, but there is a wonderfully mixed population to be found in all manner of trades and occupations, and the country undoubtedly now contains a great number of renegades and adventurers from Europe—men and women with no good behind them. In many sections there are blocks upon blocks of the poorest hovels and wooden structures serving as shops, cafés, workshops, and dwellings, and inhabited by a motley crowd of Egyptians, negroes, Armenians, Jews, and low Europeans. There did not appear to be many unemployed people, and I was assured that there was work to be had by everybody desiring it—coarse labor on the many new buildings in course of construction. One, however, sees here as elsewhere a considerable number of the frock-coated gentry (here wearing the fez),

always fairly well fed and dressed, idle, vicious, engaged in small peddling, or acting as quondam guides when subsistence becomes precarious. They accost one everywhere and are of all countries and languages. There are two large and influential clubs in Alexandria, several first-class hotels, an exchange, many elegant shops and stores, and at evening quite a display of pretentious equipages. Hotel rates are higher than in Europe, and first-class accommodation, without any extras, cannot be obtained under four dollars per day.

After October the climate of Egypt is not surpassed for mildness and equability anywhere, and many lives are prolonged for the winters spent here. In some respects the Messrs. Cook control much of the country's prosperity, and the number of people moved about by them is amazing. When one considers their paraphernalia, servants, and far-reaching influences generally, Egypt in winter without Cook would be "Hamlet" without the title-rôle. One only requires a long purse to do Egypt thoroughly and particularly; there is no trouble or annoyance about it. The natives are a long-suffering, patient, and generally honest lot, and thievery and rascality occur, if at all, in contact with the superior being from abroad. I have met with instances of rigid honesty and orthodoxy among the natives, both Mahometans and Copts, and going about among them is both safe and agreeable. Should some of the projected schemes for more general irrigation come to a successful conclusion, the area of arable and valuable land will be increased at least a million acres—by seven millions, as some assert. This land is all in the Nile delta, easy of access, and correspondingly valuable.

C. A. Siegfried.

JOURNAL OF THE BROTHERS GONCOURT.

Paris, December 28, 1887.

The brothers Goncourt were as like in appearance and in feeling as twin brothers. One of them is now dead, but we still say "les Goncourt." The survivor leads a sort of double life. He looks unhappy, like a man who has lost his shadow. The Goncourts were in one sense a rare instance, for they were literary twins. We sometimes see two men write in collaboration—we have had the case of Erckmann-Chatrian; but we know the secret of these collaborations. One does not bring the same things as the other to the literary picnic. The Goncourts really seemed to have had one heart and one brain; there is no sign which can help you to say, Here I recognize one and here the other. This mental and intellectual identification is all the more remarkable because these two brothers were not merely given to receiving and translating sensations: they had theories, they made plans, they were full of ambition, of hopes; they meant to create a literary school; they considered themselves as the true precursors of the naturalistic school.

Still, their dualism was a weakness, and it probably accounts for the failure of many of their hopes and ambitions. 'Madame Bovary' will be read when 'Germinie Lacerteux,' 'Madame Gervaisais,' 'Renée Mauperin,' 'Manette Salomon,' will be forgotten. I might say, without much injustice, that they are forgotten. Flaubert impressed his strong individuality on his work; the Goncourts had not the same creative force. They had a great sensibility, and received sensations as a mirror receives images. They were never able to give a dramatic form to their thoughts, to condense their observations in living types. They were witnesses rather than actors in the struggle of their own time, and though they pretended to be naturalists and impressionists, there is a curious want of reality in all their work. They always produce on me the effect of men who are just out of a dream.

In many respects they were interesting young men when they began their Parisian existence. They were well born (and many passages in their 'Journal,' which has just been published in two volumes, show that they were not unconscious of this great advantage); they were not extravagantly rich, but they were rich for their time; they might have lived like hundreds and thousands of other young men, enjoyed the pleasures of the gayest capital in the world, mixed with fashionable society. They made early for themselves an ideal; they had an intense curiosity with regard to artistic and literary matters, and they chose to see only artists and writers. Their name belongs to the pleiad of the poets and novelists who came after the great Romantics. Théophile Gautier was a sort of connecting link; he was a Romantic, he had been at the famous first representation of "Hernani," he had no leaning towards the naturalistic school.

In the society of artists, the Goncourts became collectors. How often did I see them on the Quai Voltaire, entering the shops of the dealers in old engravings and old drawings. They were early seduced by the French school of the eighteenth century, a school which was thoroughly despised in the time of Horace Vernet and of Ingres. They had no system, or, if they had one, they did not like the dryness of the French academical school of the Restoration; they appreciated the merit of men who were almost forgotten—of Chardin, Watteau, Boucher, Latour the pastellist, Greuze; of the brothers Saint-Aubin; of the engravers Gravelot, Cochin, Eisen; of Moreau, of Fragonard. They found a number of original drawings of these men, and bought for a trifle what would now fetch enormous prices. Their fine book entitled 'L'Art au XVIIIe. Siècle' will keep a very honorable place among the art literature of our time.

Their familiarity with the painters and engravers who lived during the French Revolution gave them opportunities for studying the French society of that period and of the Directory. The pictures they drew of these extraordinary times are vivid and full of interest, as well as their studies on the actresses of the eighteenth century, on the Duchesse de Châteauroux and her sisters, on Mme. de Pompadour, on Mme. Du Barry, on Marie-Antoinette.

The 'Journal' begins on the very day of the *Coup d'État* of December 2, 1851. By a curious chance, on that date the first novel of the Goncourts was to appear:

"In the morning when we were lazily dreaming of edition after edition, entered with noise and slamming of the doors our cousin Blamont, a ci-devant *garde du corps*, who was now a pepper-and-salt conservative, asthmatic and always angry.

"'It is done!' said he.

"'What is done?'

"'Well, the *Coup d'État!*'

"'Oh!—and our novel, which is to be put on sale to-day.'

"'Your novel? A novel? France cares little now for novels.'"

They went out, and though they looked at all the placards which covered the walls, and which had the proclamations of the new Government, they could not help searching for the placard which was to announce to the world the appearance of two more literary men, "Edmond and Jules de Goncourt." The placard was not there; the publisher had got frightened and had thrown all the placards in the fire.

The 'Journal' shows us, so to speak, the gradual development of the Goncourts; it takes us into their society. Flaubert plays a very important part in it, as well as Gautier. Gautier looked like a sort of lazy lion; he wore long hair, and had something of the sphinx. This is the way he worked at his feuilleton:

"At eleven o'clock I take a chair, I put on the table the paper, the ink, the pens, the instruments of torture. It bores me to write—it always did, it is so useless. . . . When I am once there, I write quietly like a public writer. I don't go fast, but I never stop, for, you know, I never look for anything better. An article is a thing of impulse, it is like a child—it is, or it is not. I never think of what I am going to write. I take my pen and write. I am a man of letters and know my trade. . . . I throw my phrases in the air; like cats, I am sure that they will fall on their feet."

Gautier did not like Molière, and thought the "Misanthrope" badly written. He did not care for dramas of any sort: his was a subjective nature. "All my worth," he used to say, "arises from the fact that for me the visible world exists." He pretended that few people, when they had entered a room, could tell a moment afterwards what was the color of the paper. He preferred verse to prose, and when he wished to do something good, he always began it in verse.

Flaubert was more genial, less sceptical than Gautier. Like Gautier, he was what we call a stylist, only Gautier never changed the form he had chosen, while Flaubert changed it constantly. He had absurd theories upon the art of writing, like receipts for cooking; he gave so much importance to the words that sometimes the idea disappeared. He was very coarse in conversation, somewhat of a fanfaron of vice. He chose Carthage as the scene of one of his novels, as the most corrupt place which had existed on earth. Maxime Du Camp has told us for what reason Flaubert retired so often to Croissy, in his house on the Seine: he was subject to fits of epilepsy. Nobody could have believed it, seeing him so strong and apparently robust. In Paris he saw but few people, only a small number of friends: "he lived the life of a bear." This *oursérie* of the man of letters of the nineteenth century is curious, when you compare it with the worldly life of the writers of the eighteenth century, from Diderot to Marmontel. The middle classes of the present hour only care for the man of letters when he is disposed to accept the part of a curious beast, a buffoon, or a cicerone of foreigners.

One day About is painted, and the picture is very exact:

"We meet About while we are walking in the woods of Bellevue. He talks, he unbosoms himself, he becomes expansive. It is the measure of intelligence of a very intelligent man of the world, with a remainder of the professor and a little of the quack. He speaks of his person, of his hair which is growing gray, of his mother, of his sister, of his family, of his Castle of Saverne, of his five servants, of the eighteen people he always has at his table, of his hunting, of his friend Sarcey [the theatrical critic], of his disillusion in reading over the 'Notre-Dame de Paris' last week, of the qualities of Ponson du Terrail [a popular novelist], and of the opinion he has of him with Mérimée. It is the successful *moi*, but not too heavy, not too insupportable, saved by clever monkey tricks, by little flatteries for the littérateurs present. But in his conversation there is not an atom which is not terrestrial, Parisian, and small-newspaper."

The Goncourts describe Sainte-Beuve as a small, round, rustic-looking man, with a large forehead, a bald head, great eyes starting from his head, an irregular nose, an ugly mouth with an amiable smile; looking like a provincial librarian living in the dust of books, under which some good Burgundy wine would lie concealed. Sainte-Beuve was engaged in writing

his famous 'Causeries du Lundi.' He was overworked, and complained of the necessity in such a task of jumping from subject to subject, from century to century:

"'One has not the time to love anything, to become attached to anything. . . . It breaks my head. I am like the horses who have their mouths spoiled by jerking to right and left,' and he made the gesture of a man who pulls the bit. 'Well, I am engaged for three years. At the end of three years I shall have earned about what people earn with a comedy which is not a success. Ah! the theatre,' he exclaimed; 'the comedy in verse is a thing of the past. Either you write verses which are not verses for comedy, or you write prose. Everything will tend to the novel, the field is so vast, and you can take every possible form.'"

Renan comes in, in many places, as he was a member of the once famous Friday dinners which made some noise under the Second Empire. Some of these dinners are well described in their disorderly conversations. The student of the literature of France between 1850 and the present day will find many notes to take in this 'Journal.' There are some parts which might well have been omitted, but the authors, I suppose, wished to give a proof of their perfect sincerity. The central figure of these littérateurs is the Princess Mathilde. The Goncourts worship her as the poets of the Pleiad celebrated the great ladies of their time; and, surely, nothing could exceed her kindness to her literary friends. Her salon has been the only point of contact of such men as Flaubert, the Goncourts, Sainte-Beuve, Taine, Renan, and the great world. She was able to tame all these *bears*, like Circe. "A curious physiognomy, this Princess, with the succession of impressions of all sorts which she receives, and with those enigmatic eyes which pierce you. Her mind has something of her eye. Here and there a word comes out which paints, *à la* Saint-Simon, a thing or a man." The Princess Mathilde is no longer young, but she has kept the literary sceptre of a drawing-room. All her friends are very devoted to her; Goncourt still observes her and notes her clever sayings. She has chosen the better part, and never attempted to play a political rôle. Goncourt's gratitude and devotion to her are almost touching. He tries not to conceal it, and he prides himself candidly on the friendship of the niece of the great Napoleon, who condescends to be the most natural and best of women.

Correspondence.

QUESTIONS ON THE ISSUE OF THE DAY

To the Editor of The Nation:

Sir: Now that the signs of the times point unmistakably to a clearly defined *national issue* between the great parties next fall, provided the Republicans do not force a personal one through the character of their nominee, and in view also of the fact that the popular discussion through the campaign is likely to be narrowed down, on the protectionist side, to the alleged dilemma (as the *Tribune* has just very ingeniously put it), *ruined industries* or else *pauper wages*, as the result of tariff reform —persistently called by the other side "free trade"—would it not be wise for the reformers largely to shape their discussion so as to anticipate this form of argument before it has fastened itself ineradicably in the prejudices of the people addressed by the *Tribune* and its like?

Personally, although on general and largely *à-priori* grounds, an out-and-out free-trader, should be glad to know how a careful thinker and trained economist would meet the seemingly grave objection that to open the door to foreign competition would necessarily bring, at last, American wages to a par with English ones in the same industry. Is it enough to answer that the American operative would be sufficiently protected by the 3,000-miles-freightage with which European goods must be handicapped in the competition with our own? Or shall we say that American wages cannot fall without a corresponding rise in English ones, both seeking a common level, as artificial conditions are removed? Or, finally, shall we answer that, happily or unhappily, the industrial conditions of the two countries cannot, for a long time, at any rate, be made the same—social, governmental, and other considerations forbidding it; and that accordingly the faithful, intelligent American workman must long command, tariff or no tariff, a compensation above that of his English brother?

How, also, shall we meet the *Tribune's* plausible suggestion that the pauper earnings of the needle-women, as Mrs. Campbell has so feelingly told the story, fairly hint what men's wages will be brought to when *their* ranks in the several industries are in effect similarly overcrowded by foreign competition?

I, for one, should like to hear your answer, however elementary or puerile the difficulty may seem to you.—Respectfully yours,

H. D. C.

Eastport, Me., December 29, 1887.

[There are so many answers to the foregoing queries that we find ourselves somewhat embarrassed to know where to begin. Perhaps we may as well start by asking why foreign competition does not bring English wages down to the level of German, French, and Belgian wages, which are as much lower than English as ours are higher.

For a second answer we might ask how we are enabled, with our high wages, to export and sell abroad in competition with foreign producers the following quantities of manufactures in a single year:

Iron and steel manufactures	$16,605,046
Leather "	9,692,408
Wood "	21,464,322
Agricultural implements	2,561,602
Books, maps, etc	1,389,350
Carriages	1,495,475
Chemicals	4,806,193
Clocks and watches	1,345,940
Cotton manufactures	11,866,591
Flax and jute "	1,314,140
Gunpowder, dynamite, etc	1,367,223
Paraffine	1,725,344
Refined sugar	16,071,767
	$91,707,401

This list is taken from the exports of the fiscal year 1885. It might be much extended, as we have selected only the items whose amounts were upwards of $1,000,000.

Now, the wage question enters into all these articles of manufacture just as much as it would into any article that might be imported. Will anybody tell why the higher wages of this country do not prevent us from exporting a hundred million dollars' worth of manufactures now, and selling them in competition with the lower wages of England and the still lower wages of Germany, France, and Belgium?

For a third answer we refer "H. D. C." to the report of the Hayes-Oliver-Porter Tariff Commission of 1883, where he will find the wages question fully considered as preliminary to an expression of opinion that a general reduction of the tariff by 20 or 25 per cent., as recommended by them, would not "*in any case* diminish the compensation of labor." They probably knew what they were talking about, and as they were the chosen ones of the protected interests, their testimony is not open to suspicion.—Ed. Nation.]

WORKINGMEN'S THOUGHTS ON THE TARIFF.

To the Editor of The Nation:

Sir: Four years ago I talked free trade in this town, and was nearly thrown in the Lake in consequence—at least, I was threatened with it. But now I am surprised to notice the number of men, workingmen, steel-rail men at that, who are low-tariff men. It has been my fortune for the last six or seven years to associate pretty intimately with men employed in steel-rail and nail mills. I have noticed that the protection argument which has taken the most hold of their imagination (one cannot say their reason) is the argument deduced from a comparison of wages in England and America. Their bosses have taken great pains to enlighten them on this subject. But the crassest ignorance prevails among them concerning the wages of a protected country like Germany and France compared with England. Nor had any of them the slightest idea of the relative purchasing power of money in England and America. Some of them now have a glimmering idea of the difference, and more are learning.

Another point. Nearly all of them harbor a vague delusion, some admitting and some denying it, but all arguing from the assumption that high profits for the manufacturer means necessarily high wages for the men. A sort of Christian charity, philanthropy, or disposition to "divy up" is assumed. They all know by harsh experience the disposition on the part of the manufacturer to reduce wages when his profits are lessened, and they infer, per contra, a disposition to raise wages when the "boss" is making a "good thing" of it. Yet when convened quietly and dispassionately, and asked if they ever knew of such a case in their own life, they generally scratch their heads and acknowledge manfully they never saw it in actual practice. The protection doctrine, too, of "building up the country" exercises a mysterious effect on their imaginations, which they never can set forth palpably in words.

In these discussions between workingmen, though often long and earnestly carried on, I have observed the most admirable good temper among the men, frequently relieved with truly pungent sallies of wit as well as pithy apothegms of political economy. Not long ago a workingman in my hearing expressed his views as to what determined the wages of labor thus: "It is the man at the door that sets the wages of the man at the bench." I thought it very neat, but it may not have been original.

Any man grossly deceives himself who supposes the American workingman is not thinking on economic questions, especially on the tariff. It may be loose, vague, illogical thinking, but there is much scratching of heads and turning over of ideas among these men, and they are beginning to doubt the efficacy of protection for them personally. Along with this is a most healthy growing distrust of the boss's views on such questions. E. L. M.

South Chicago, January 5, 1888.

THE ORGANIZATION OF THE HOUSE.

To the Editor of The Nation:

Sir: I am a constant reader and admirer of the independence of your paper, and, being an ex-member of Congress, I take a deep interest

in your discussion of the difficulties of a prompt organization of the House of Representatives. I thought, when a member of Congress, and I think yet, that the Speaker should not have the autocratic power of appointing the committees, but he should have some control thereof. I thought that the fairest and most expeditious mode of selecting the committees would be for the majority of the House to elect the Speaker, the Chairmen of the Committees on Ways and Means, Appropriations, and Judiciary, and that these four should on the next day select the chairmen of all the other committees, and, in case of a tie among the four, the Speaker should have another vote; that the Speaker and the chairmen thus selected should at once select their members of the majority party for each committee; that the minority of the House should select the men to stand first of the minority on the Committees of Ways and Means, Appropriations, and Judiciary, and that these three should the next day select the members of the minority to stand first on each of the other committees, and that the members so selected should select the members of the minority party to serve on the other committees. This could be arranged by the rules. EX-MEMBER.

MEMPHIS, TENN., January 2, 1888.

RING-GROWTH IN TREES.

TO THE EDITOR OF THE NATION:

SIR: The discussion on the question of the age of the Sequoias has brought up the question of the truthful record of age as indicated by so-called annual rings. While the former question is one of curiosity, the latter is one of decidedly practical importance, as its answer may affect the property rights of any citizen who is unfortunate enough to have to rely for the boundary lines of his land claims on the blazes with which a backwoods surveyor has marked the course of the survey lines. For, as is well known, the courts have had often to decide the priority of a survey, and therefore title to land, solely upon the evidence of a surveyor's overgrown mark, made a certain definite number of years ago, the "annual" rings deciding the time of survey.

It is, then, of great importance to the community that the subject should not be lightly or, without very sufficient basis, authoritatively discussed; it is desirable that, without overwhelming evidence, the belief in the accepted theory should not be disturbed. This accepted theory claims that wherever the seasons are determined by decided changes of temperature, and consequent rest followed by reawakened vegetation, such changes are marked by the formation of annual rings—that is to say, the cell elements constituting the wood formed in the first few weeks of awakening activity in the spring differ in form and appearance from those formed later in the season. That the same effect in a smaller degree may be expected from other alternating checks and resuscitation of vegetative activity, is but natural; such climatic disturbances as droughts followed by rainy seasons, or even the defoliation from some cause early in the season, with consequent recovery of foliage, will produce a similar appearance in the arrangement of cell elements to that which characterizes the annual ring.

The counting of an excessive number of rings during a given number of years, which is reported from the fitful climate of Nebraska, is, therefore, not surprising. But it also reveals, probably, a prejudice against the accepted theory, or a love for new discoveries and a lack of sharp observation on the part of the reporter; or else the less distinct appearance of the intermediary rings and their characteristic discontinuity, if followed around the section, would have been noticed. Having myself had occasion, for purposes of forest-scientific investigations, to count the rings of many hundred sections of trees, I may be presumed to know something of the difficulty sometimes experienced in determining the annual as distinct from secondary rings. Yet, so far, no evidence has come before me which would shake my belief in the accepted theory upon which the whole scientific system of German forestry is practically based.

To allay all doubts, the Forestry Division of the Department of Agriculture is collecting material upon which to decide this very important question, and seeks the coöperation of all those who are in position to forward sections of trees with well-authenticated record. It may be of interest also to state that as trees of positively known age are probably rarely cut, and as the height at which they are cut may leave from two to five years' growth untouched, and thus lead to discrepancies, other records must also be made use of. For instance, a short time ago I read, from a section of a hickory tree sent in, its life history, which was afterwards confirmed by inquiry, the rings revealing that nineteen years before it was cut, having grown in the dense shade of the forest, an overgrowing neighbor had been removed, but in three years' time another neighbor had taken possession of the empty space above and set back the hickory; the season of 1879 was marked as unfavorable, and in 1875 a sudden change of conditions—found to be the clearing of a field, by which the tree was placed in full enjoyment of light—was unmistakably indicated.

Hoping that these statements will prove of sufficient interest to be presented to your readers, and may engage their coöperation in supplying evidence for or against the theory of annual rings, I am, very respectfully,

B. E. FERNOW,
Chief of Forestry Division.

WASHINGTON, D. C., December 29, 1887.

THE CHEAP LIBRARIES AND ROYALTY COPYRIGHT.

TO THE EDITOR OF THE NATION:

SIR: Mr. Pearsall Smith has, it seems to me, neglected in his proposition the radical evil which it is the aim of true international copyright to uproot, and upon this point a few words may not come amiss.

One, and not the least, of the objects of the "League" is to put a stop to these unreasonably cheap editions of foreign authors. But if Mr. Smith's plan were to be adopted, these libraries, so called, could continue to publish their books at the same retail price, and reserve to themselves the same profit as before their piracy received its charter, the only difference being that two cents, let us say, upon every copy would be taken from the retail dealer to give to the author. For these twenty-cent books cost the retailer but thirteen cents, so that if the publishing house were to add two cents to the wholesale price, the retailer would still clear twenty-five per cent., and the author would receive but one hundred dollars on five thousand copies of the book which was printed contrary to his wishes, but with his forced consent. CHARLES E. TAYLOR.

NASHUA, N. H., January 1, 1888.

DARWIN ON CLASSICAL STUDIES.

TO THE EDITOR OF THE NATION:

SIR: Although you have already published an excellent review of the 'Life and Letters of Charles Darwin,' I hope you can find room for the following extracts from the book, as they show Mr. Darwin's opinion of the classics as a means of education. Of the preparatory school at Shrewsbury he says: "Nothing could have been worse for the development of my mind than Dr. Butler's school, as it was strictly classical" (vol. i, page 29). Of the course at Cambridge he says: "During the three years which I spent at Cambridge my time was wasted, as far as the academical studies were concerned, as completely as at Edinburgh and at school" (vol. i, p. 40).

The answers to Mr. Francis Galton's questions concerning his education are particularly emphatic (vol. ii, p. 355):

How taught?	I consider that all I have learnt of any value has been self-taught.
Conducive to or restrictive of habits of observation?	Restrictive of observation, being almost entirely classical.
Peculiar merits?	None whatever.
Chief omissions?	No mathematics or modern languages, nor any habits of observation or reasoning.

In a letter to a relative the following passage occurs:

"To return to schools. My main objection to them, as places of education, is the enormous proportion of time spent over classics. I fancy (though perhaps it is only fancy) that I can perceive the ill and contracting effect on my eldest boy's mind in checking interest in anything in which reasoning and observation come into play. Mere memory seems to be worked. I shall certainly look out for some school with more diversified studies for my younger boys" (vol. i, p. 354).

These opinions of Mr. Darwin should have all the more weight on account of his rare modesty and his over-readiness to give credit to others. They seem to me to be particularly interesting and valuable just now on account of the rabid criticism directed against the liberal and progressive policy of Harvard University.

H. T. P.

POTTSVILLE, PA., January 2, 1888.

GERMAN INSURANCE FOR WORKINGMEN.

TO THE EDITOR OF THE NATION:

SIR: The suggestive article on compulsory accident insurance for the German laborer in the *Nation* of November 24 is well supplemented by one in the Berlin *Nation* of December 17, which may escape your notice. In substance, the writer (Dr. Th. Barth) says that the laboring classes are either indifferent to the insurance legislation or hostile to it as trenching on their personal liberty. More especially: "Admirers of State Socialism would be greatly embarrassed to furnish evidence that in labor circles, during the past ten years, so much as a finger has been lifted in behalf of this policy professedly so rich in blessings."

In times when one hears so much about the rights of labor and so little of the duties of the laborer, when the air is thick with legislative schemes of the perpetual-motion variety—schemes to get work out of a social machine without putting a compensating amount of energy into it—such facts as Dr. Barth states in regard to social legislation in general cannot be too often repeated. He says: "It has been repeatedly shown that it is impossible to give the laborer legislative assistance except at his own cost. It usually comes to pass in legislation of this kind that the laborer has to pay for all kinds of subsidiary objects, either in personal freedom or in the producing power of his labor." F. ANGELL.

LIEPZIG, December 18.

Notes.

Chas. Scribner's Sons have in preparation 'The Tailor-Made Girl,' society dialogues from *Puck* by Philip H. Welsh; and a study of the conditions in which Mormonism took its origin, by J. H. Kennedy, editor of the *Western Magazine of American History*.

'Shakspere in Fact and in Criticism,' by Appleton Morgan, is in the press of Benjamin & Bell.

T. A. Trollope's 'What I Remember' will be issued in this country by the Messrs. Harper, as will Smiles's 'Life and Labor, or the Characteristics of Industry, Culture, and Genius.' They announce, too, 'Mr. Absalom Billingslea, and Other Georgia Folk,' by Col. R. M. Johnston; and a series of "English Classics for School Reading," edited by Dr. William J. Rolfe.

W. S. Gottsberger announces 'Leon Roch,' a romance by B. Perez Galdós, from the Spanish by Clara Bell, in two volumes, and a new translation of 'Paul and Virginia,' also by Clara Bell.

Thomas Whittaker issues this month 'Readings and Prayers in aid of Private Devotion,' by Bishop Clark of Rhode Island; 'A Manual of Church History,' by Rev. Arthur Charles Jennings, author of 'Ecclesia Anglicana'; and 'An Exposition of the Apostles' Creed,' by the Rev. John Eyre Yonge.

Ticknor & Co., Boston, announce for immediate publication 'Queen Money,' a new novel by the author of 'The Story of Margaret Kent'; 'Looking Backward; 2000-1887,' by Edward Bellamy; 'Under the Southern Cross,' by Maturin M. Ballou; 'Trinity Church, Boston, Mass.,' being the fifth of the "Monographs of American Architecture," a portfolio containing 22 gelatine views and 1 heliochrome, 13x16 inches; and a 'Decennial Index of Illustrations in the *American Architect and Building News*,' 1876-85.

Henry Stevens & Son, London, issue this month 'Johann Schöner, Professor of Mathematics at Nuremberg: a Reproduction of his Globe of 1523, Long Lost,' etc., with new translations and notes on the globe by the late senior member of the firm, and a bibliography by C. H. Coote of the British Museum.

A new "Library of Philosophy" is to be undertaken by Swan Sonnenschein & Co., London. The first title on the list is 'Sensationalists: Locke to Mill,' by W. S. Hough, Ph.M., of Michigan, who will also produce, by way of introduction to the Library, a translation of Erdmann's 'History of Philosophy,' in three volumes, whose appearance is set down for October. The general editor of the Library is J. H. Muirhead, M.A.

The Century Co. has issued in beautiful form the first volume of the War Papers of its magazine, doing everything to make it attractive which large pages, clear type, good paper, and excellent printing can do. As the papers originally appeared, no chronological order was observed; but in the book form they are so arranged as to make a consecutive history, beginning with the bombardment of Sumter. New papers have been added to the series to supply vacancies and to bind the whole into one narrative, so that a considerable percentage of the volume is new matter. We have frequently expressed our high estimate of the value of the series, and little more can be added except to say that the exceptionally high character has been maintained to the end. The novel scheme of printing side by side the story of battles and movements as told by men of opposite sides who participated in them, was a delicate experiment, but has proved a great success. Union and Confederate soldiers have told their remembrances in a generous spirit, and the presentation of both sides has never degenerated into controversy or lost its dignity. The tone has, in fact, been so cordial that it most resembles that of a group of comrades comparing their memories with mutual respect and good-fellowship.

A Boston lady has induced T. Y. Crowell & Co. to reprint from their Tolstoi volume, 'Ivan Ilyitch,' the short story, "Where Love Is, There Is God Also"—a touching exemplification of "Inasmuch as ye have done it unto one of the least of these my brethren," etc. A pretty tract in white and gold is the result.

A little book by Helen Ekin Starrett (Chicago: A. C. McClurg & Co.) is called 'Letters to Elder Daughters, Married and Unmarried,' and is full of good advice and wholesome suggestion about housekeeping, home comforts and influences, occupation for women, etc. Two most sensible chapters are entitled respectively, "Household Decoration" and "The Relative Importance of Things." Thoughtful and liberal are those on "Women's Clubs" and "The Superior Woman." Almost the only idea advanced which seems to us mistaken is that of the desirability of banishing from the houses, at any rate of people of moderate income, both cook and cooking. But surely it is better to have "the household fires burn warm and bright" in kitchen as well as parlor; for not only do we want the means of ready hospitality, of consulting private preference, and of giving some individuality to the home-table, but also our daughters need to keep their opportunities for practical education; and then again, in sickness how can we spare the home-kitchen?

Another little book which has come to our notice is 'A Bundle of Letters to Busy Girls on Practical Matters' (Funk & Wagnalls). Miss Grace Dodge has written it and dedicated it to her "Dear Friends and Fellow-members of the 38th St. Working-Girls' Society." As may be inferred from the author's name, and from the title and dedication, it has a practical and not in the least a literary aim. The plain talks in it go straight to the point without mincing matters, and are such as must do a great deal of good to those for whom they are designed. It is hard to particularize any portions when all are so good; still, mention might be made of a chapter on "Men Friends—Prospective Husbands and Wives," and of another on "Marketing and Food." They are clear, forcible, important. In her introduction, the author expresses a wish that her book might lead to gatherings of young women for familiar talks similar to those which she has epitomized in it. It ought to do good, and should be widely disseminated.

We bespeak a wide reading for Gen. Francis A. Walker's paper on "Arithmetic in the Boston Schools" in the Syracuse *Academy* for January. The evil he attacks (and it is by no means local) is very great, and the only way of reducing the makers of text-books to reason is that adopted by the School Board of Boston in its prescriptions as set forth by Gen. Walker. We observe with pleasure that the new volume of the *Academy*, which begins with the February number, is to be enlarged for the third time, with a proper increase in the price of subscription. As the editor truly remarks, "These three successive enlargements may be accepted as an indication that there is a field for just such a journal as the *Academy*, . . . devoted solely to the interests of secondary teachers and their work." The *Academy* offers a prize of fifty dollars for the best essay on "Science in Secondary Schools." "Contestants must confine themselves simply to practical exposition of results sought, and of the means of attaining these results in the school-room." Literary merit will be a subordinate consideration. The essay must not exceed 5,000 words, must be signed with a fictitious name, and must reach the office of the *Academy* not later than March 15, 1888.

The *American Meteorological Journal* for December contains a contribution to the literature of the supposed increase in rainfall upon the Plains, but it cannot be said that it is a contribution to our knowledge of the subject. The author, Mr. Harrington, who is one of the editors of the magazine, finds, by a comparison of two rainfall maps of different dates, that the later one places the lines of equal rainfall further to the westward upon the Plains than the earlier one does, and argues therefrom that the rainfall has increased. He even builds higher upon this foundation of sand, and evolves the rate at which the rainfall of this region is increasing. Had Mr. Harrington been aware that these rainfall maps are but crude generalizations from insufficient and contradictory data, that there is often no good reason, beyond the judgment of the maker, for drawing a line of equal rainfall in one place rather than in another, fifty or a hundred miles away, as is perfectly well known to those who have constructed such maps, he would have displayed more caution in his conclusions. If we add that the maps which he used were the Blodget map, published thirty years ago, and now universally discredited, and the Dennison map, which was published to sell, the worthlessness of his conclusions becomes apparent.

Genealogical Queries for 1888 (Newport: R. H. Tilley) is in the printer's hands.

The *American Annual of Photography and Photographic Times Almanac* for 1888 (Scovill Manufacturing Co.) is a solid volume of 329 pages, with a generous addition of advertisements, not inferior in interest to the text. The illustrations, as in last year's issue, are examples of a variety of "processes," with a promising new photolithograph among them. The frontispiece landscape study, a photogravure by Obernetter of Munich, is an exceptionally fine performance.

Routledge's Almanack for 1888 is a close approach to the indispensable *Whitaker's*, differing from the latter in such a way as to supplement it usefully. Not containing so much matter, its print is larger. The arrangement of its main sections is convenient, being alphabetical, as, Amusements in and about London; Army, Navy, and Reserve Forces; Art of the Year; Banking, Finance, etc.; Colonies and India; Commerce and Trade: Ecclesiastical; Educational and Scholastic Establishments; Foreign Countries, and so on to Science and Sports and Pastimes. The editor apologizes for crudities and errors in a first venture, and asks for corrections. We may notice, then, that Mr. Manning's successor in the United States Treasury has been overlooked, and that Mr. Lamar's second initial is transformed from Q into O.

Recent events give unusual interest to the *Hawaiian Almanac and Annual* for 1888 (Honolulu: Thos. G. Thrum). The preliminary tables are followed by the present Constitution of the Hawaiian Kingdom, "subscribed and sworn to by His Majesty" on July 6, 1887, with its "Whereas, the Constitution of this Kingdom heretofore in force contains many provisions subversive of civil rights, and incompatible with enlightened Constitutional Government," etc. The revolution which led to this is briefly described under the Retrospect for the Year.

The literary articles offer nothing striking this year.

Armand Colin & Cie., Paris, send us the fourth issue of their *Annuaire de l'Enseignement Primaire*, edited by M. Jost, Inspector-General of Public Instruction. It is a plump pocket volume, with abundant statistics. The personnel is particularly well recorded, and we have also a chronological summary of official decrees and other documents pertaining to primary instruction for the school year 1886-87, other decrees in full, list of medallists, prescribed text-books, etc. These sections are followed by contributed articles on sundry topics, such as the Teacher's Position Abroad (part of a series); Overpressure in the Primary School; Recitation in the same; What We See in the Heavens (an illustrated familiar discourse on astronomy); Literary Instruction in the Upper Primary School; Music in the School Course; Geographical Review for the Year; Progress of Science, Obituary, Bibliography, etc., etc. Where in this country should we look for the analogue of this capital little publication?

The latest international yacht contest is commemorated in one of those handsome volumes published on occasion by the Boston city fathers —'A Testimonial to Charles J. Paine and Edward Burgess, from the City of Boston, for their Successful Defence of the *America's* Cup.' The account of the municipal reception to owner and designer of the *Volunteer* in Faneuil Hall is preceded by a very convenient history of the Anglo-American races from that at Cowes in 1851 down. But admirable above all is the rich series of illustrations, mostly photographic, showing the Cup, the *America*, *Puritan*, *Genesta*, *Mayflower*, *Galatea*, *Volunteer*, and *Thistle*, Faneuil Hall decorated for the reception, etc., with portraits of Gen. Paine and Mr. Burgess engraved on steel. This comparison of the craft—in one instance during a race—is very instructive, and we suppose is to be had nowhere else.

Ten more parts of the condensed Universal History issued by Grote at Berlin, under the editorship of Flathe, Hertzberg, Justi, Pflugk-Harttung, and Philippson, come to us from B. Westermann & Co. These numbers, 70-79, deal partly with Vandals, Visigoths and Burgundians, and the German states erected within the Roman Empire, and partly with the Thirty Years' War and the succeeding European epoch. The authoritative text is, as usual, enriched with a large number of authentic engravings, contemporary where possible, and including portraits, facsimiles of official documents, caricatures, etc., battle scenes, manners of the times, coins, armor, maps, etc., etc. The mechanical execution throughout is admirable.

Another first-class work, the 'Allgemeine Naturkunde' (Leipzig: Bibliographisches Institut), we receive from the same American house in Parts 79-107. In these are concluded vol. ii of the Descriptive Geology and vol. i of the Plant Life, while Dr. Friedrich Ratzel's Ethnology is continued, largely with reference to Africa. Here again the illustrations greatly enhance the value of the publication. Among the chromolithographs we remark one showing the autumn coloring on Lake Erie.

The announcement is authoritatively made that there is at length a prospect of a complete and correct edition of the Masora. The firm of Romm in Wilna (publishers of the splendid edition of the Babylonian Talmud recently brought out) have in hand a new edition of the so-called great Rabbinical Bible, to which Dr. Seligman Baer (well known as the colaborer of Prof. Franz Delitzsch in the publication of the best edition of the Hebrew Bible) has undertaken to furnish the Masora. The arrangement adopted will be the same as in Jacob-ben-'Hayyim's edition, with this exception, that wherever a word occurs for the first time, there all that is Masoretic in regard to it will be given; so that, by the help of a Concordance, any particular rubric will be readily traced. The first part of the manuscript is already in the printer's hands. Ever since the sharp review by Dr. Baer of Ginsburg's edition of the Masora, in the fortieth volume of the *Journal* of the German Oriental Society, it has been expected that Dr. Baer would undertake this work. It is generally agreed that Dr. Ginsburg's work is poorly edited, and so unscientifically arranged as to be of little practical use.

Mr. Isaac Myer, 209 S. 6th St., Philadelphia, is about issuing to subscribers 'The Philosophical Writings of Solomon Ben Yehudah Ibn Gebirol, or Avicebron, and their Connection with the Hebrew Qabbalah and Sepher haz-Zohar,' etc., etc. Only 350 copies will be printed, from type.

The land question has never been settled in the case of the Crown peasants of the Transcaucasian territory; and before setting about this important task the Ministry of Imperial Domains decided to investigate extensively the actual economical condition of the peasants on Crown lands in that region. This investigation was undertaken in 1884, and is now completed. It was conducted chiefly by natives of the country who had received special technical instruction, and each settlement was handled separately. The results have been printed at Tiflis in seven huge volumes, containing invaluable materials for the study of life in one of the least known districts of the Russian realm. Among other curious facts thus brought to light are some connected with a community of land which has always been supposed to be peculiar to Slavic and chiefly Great-Russian tribes. But it now appears that the same system, on a higher scale, exists among the natives of Transcaucasia, with a singular tendency to parcel out the land with an eye to the greatest profit of the poorer portion of the community. The "Tens" (*dagi*) are voluntary associations of householders, which are formed either every year or when a fresh partition of the land takes place. They take their land in common and afterwards parcel it out among their members, enjoying the privileges of irrigation together and acting as a unit in the matter of taxes, police duty for the settlements, and so on. As nothing will grow without artificial irrigation, the question of water-rights presented a difficult problem, which the natives have solved by devising a very complicated system of water administration.

—The January *Century* opens the new volume with the usual variety of light and serious prose, but the number itself is an unusually good example of the fixed type, and offers a fair occasion for congratulation upon the character of our most popular magazines. Several articles are of a high order, but among them four at least should be singled out. The Russian paper by George Kennan describes the state of the provincial prisons. The incurable barbarism of the system is well brought out. The degradation in material matters, the cruelty inflicted on such of the prisoners as have mind or feeling to suffer as men or women, and the means of secret communication by the knock and figure alphabets, are the substantial topics. It is not surprising that, as we learn from the press despatches, these pages are blotted out by the Russian censor of the foreign mails. The instalment of the Lincoln biography is concerned with the formation of the Cabinet and the first conferences in the White House about Fort Sumter, and contains several interesting unpublished documents. The economy which should be practised in the matter of food is treated by Professor Atwater, but without any fresh suggestion. The character of Ruskin, whose portrait is the frontispiece of the number, is treated with great frankness and after an heroic fashion by Mr. Stillman, who has little opinion of him as an art critic, but regards his moral and humanitarian nature with what can only be called veneration. His wounds, whatever else may be said of them, are those of a faithful friend, and he publishes a letter written many years ago to him by Ruskin which is an admirable expression of helpful friendship. The paper upon the Catacombs by Dr. Schaff is a good illustration of the circumstances and spirit of early Christianity in the days of its simple poverty; the two sketches of travel in the West are entertaining; and Mr. Cable's novel easily leads the fiction, of which there is sufficient. An interesting letter upon Hawthorne's patriotism concludes the number. This is a list which, if not eminent for literature, is eminent for usefulness.

—The Modern Language Association held its fifth annual Convention in the chapel of the University of Pennsylvania on December 28, 29, and 30. There was present a large delegation representing the leading universities, colleges, and schools of the country. The University of Pennsylvania welcomed the Convention in a reception given the first evening, at which Dr. Pepper, the Provost, made the address, followed by Prof. MacAllister, who discussed the place of modern literature in the education of our time. In the absence of James Russell Lowell, the President, Dr. Garnett of the University of Virginia, Prof. Joynes of the University of South Carolina, and Prof. Morgan Hart of the University of Cincinnati, successively presided at the sessions. A committee was appointed to present a memorial to Congress asking for a remission of taxes on foreign books. Another committee was appointed to organize a phonetic section of the Association. The papers read at the several sessions were —by Prof. Tolman of Ripon College, on the Style of Anglo-Saxon Poetry; by Prof. White of Cornell, on the Modern-Language Seminary System; by Prof. Lang, on the Face in the Spanish Metaphor and Proverb; by Prof. Primer, on Charleston's Pronunciations; by Dr. Wood of Johns Hopkins, on the Brief or Pregnant Metaphor in the Minor Elizabeth an Dramatists; by Prof. Fortier of Tulane University, La., on Louisiana Folk-lore; by Prof. Kroeh of Stevens Institute, on Methods of Teaching Modern Languages; by Prof. Karsten of Indiana University, on Speech Unities; by Prof. Collitz of Bryn Mawr, on the Weak Verbs; by Prof. Sheldon of Harvard, on the Canadian French Dialect in Maine; by Dr. Goebel of Johns Hopkins, on Paul's Principien; by President Shepherd of the College of Charleston, on Macaulay's English; by Prof. Smyth of Philadelphia, on American Literature in the Class-room; by Dr. Bright of Johns Hopkins, on the English Curriculum in the University; by Prof. Elliott of Johns Hopkins, on the Earliest Works on Italian Grammar and Lexicography Published in England. Very great interest was shown in papers that gave the results of original investigations in living dialects, which Prof. Elliott of Johns Hopkins has done so much to promote. The hospitality of the University and the citizens of Philadelphia was characteristic of the City of Brotherly Love. Each day's sessions were relieved by receptions given by the Provost of the University at his residence, by the Uni

versity, the Historical Society, and the Penn Club. The Association is now an established and flourishing institution, whose members represent the best scholarship of the country. Its Contributions enter on their third volume. So successful has been its organ, *Modern Language Notes*, that a Review has been projected to take its place among the leading quarterlies. The next Convention will be held in Cincinnati.

—Mr. H. T. Frueauff writes us from Easton, Pa.:

"Your article on the 'Book Trade in Germany' was exceedingly interesting, both to the trade in general and, no doubt, to your book-buying readers. While reading the review of the *Jahrbücher* article, I wondered whether you had seen and your German readers perused the exceedingly interesting romance called 'Eulen und Krebse,' by August Niemann, commenced in No. 3 of the *Neue Monatchefte des Daheim*. The plot of the story is centred in Leipsic, among the bookmakers and booksellers. Incidentally, a clear and interesting insight into the 'book world' of that greatest of book cities is woven into the story. As far as I know, no book has ever been written in any language with this object in view. No doubt many familiar with the German language will find much to interest them in 'Eulen und Krebse.'"

—Hollingbury Copse is "that quaint wigwam on the Sussex Downs which has the honor of sheltering more record and artistic evidences connected with the personal history of the great dramatist than are to be found in any other of the world's libraries." Thus Mr. Halliwell-Phillipps speaks on the title-page of his latest list of Shakspere rarities. In all former editions his claim is more moderate, saying, instead of "the world's libraries," *south of the metropolis*. This calendar of curiosities, lately printed "for private circulation and presents only," will have a charm for all Shaksperians. It is an octavo of 168 pages, and chronicles 805 memorabilia. The comments of the author add much to their significance. They indicate lines on which, as he remarks, "a large work could hardly fail to be welcome to the student" of Shakspere. His regret is that "the time occupied in gathering together the necessary artistic and literary material has practically excluded the collector himself from the opportunity of making an effective use of his accumulations." We hope better things. Mr. Phillipps is eleven years younger than Gladstone, has not a tithe of his disquiets, can never rest except when hard at work, does all his writing before noon, and some of it before light. He is still good for another *opus magnum*. The two hundred Shaksperian volumes of Mr. Phillipps, with other unique relics, as their possessor maintains, have cost more pains and perhaps pelf than would have been requisite for accumulating fifty thousand modern books on the works of the dramatist. *Ponderentur, non numerentur*. Aside from printed matter, the Hollingbury treasures are of the four following classes: (1.) Early engraved portraits of Shakspere, among which the Droeshout is easily preëminent. (2.) Authentic personal relics, such as the title-deeds of his estates in Stratford and of the Blackfriars theatre. (3.) Documentary evidences respecting his estates and individuals who are connected with his biography, such as autographs of Southampton and Essex, Sir Thomas Lucy, and John a' Combe. (4.) Artistic illustrations of localities connected with his personal history. In this last line neither the Bodleian nor the British Museum has anything worth speaking of. The Hollingbury display is unique aside from that at the birthplace, which owes its own existence to Mr. Phillipps.

—Our copy of Mr. Phillipps's curiosity Calendar, coming through the Post-office, was detained there till a customs duty was paid. But this book, like a hundred others by the same author, and a majority of those imported by American specialists, would never be reprinted in the United States. The tax then protects no American industry, unless perhaps the salary of here and there a customs officer who arbitrarily, at the port of landing, marks by guess the amount of duty. We say "arbitrarily," for on the same work we have sometimes paid a dollar tax and sometimes half-a-dollar. But while this tariff protects nobody, it is a tax on knowledge, and bears hard on our least lucrative profession, that of scholarly specialists. These are the men who send abroad, each in his own department, for the most advanced works—works too far advanced to be popular—and which therefore stand no chance of American republication. The best of these scholars are frequently not salaried professors, and are often hindered from ordering a book subject not only to a tax, but to one imposed at the caprice of an official a thousand miles away, and which, however illegal or unreasonable, they are not likely to get abated. Publishers ought not to be jealous of a little mercy shown to these students struggling to keep abreast of the times. With this view of things it was provided in the United States Postal Laws of 1879 (section 1135) that "collectors of customs may in their discretion remit duties on importations of single copies of books of less dutiable value than one dollar, when such books are intended for the personal use of the addressees." Under this regulation we imported Skeat's 'Etymological Dictionary' as it was published number after number. Many students did likewise, and by their comments they no doubt doubled the sale of American editions when our publishers brought out the completed work. This law worked well in other ways more than we can now speak of. But in 1882 this system was broken up by the Secretary of the Treasury, who "instructed collectors that all books of whatever value, bound in stiff covers, or which are *usually* so bound, should be treated as dutiable at 25 per cent." (Postal Laws of 1882, p. 785.) We first became aware of this change when we sent for the 'Oxford Parallel New Testament,' a sort of Tetrapla that has never been reproduced in this country, and never will be, but which is invaluable, showing at the same time not only the Authorized and the Revised Versions, but the original of both. The book and the postage were costly, but the tariff was the last proverbial peppercorn.

—Mme. Boucicaut, the head of the great Parisian establishment of the Bon Marché, and the widow of M. Aristide Boucicaut, its founder, died last month at the age of seventy-two years, leaving her immense possessions in a manner which calls for special attention. No statement of the actual amount of her wealth has appeared—probably it cannot be even approximately estimated at present, so great is it; but the dispositions she made of it were of corresponding largeness, and deserve the widest admiration. A fortune laboriously and honorably accumulated has been generously scattered in a rain of the most liberal benefits. The Bon Marché, the largest and most successful of the great Parisian houses of which Zola's "Au Bonheur des Dames" was only a type, grew gradually out of the little shop which once occupied a very small part of the vast space now covered by the buildings of the great establishment into which it has developed, under the wise care of the two who began life there as small shopkeepers. Ten years ago M. Aristide Boucicaut died, but the Bon Marché continued to be conducted by the surviving proprietor according to the wise and generous plans that had been perfected during his lifetime, by which the employees, according to their position and the length of their services, shared in the profits of the establishment. About three hundred of these employees, who have gradually been associated with the proprietor, make up the *Société civile*, as it is called, of the Bon Marché. To this *Société civile du Bon Marché* Mme. Boucicaut has left the whole vast establishment, including the buildings and the land upon which they were erected, the whole valued at about $12,000,000. To the various employees of the Bon Marché, whether men or women, divided into classes according to their positions and length of service, she left legacies varying in amount from $200 to $2,000; and to the workmen and women of all kinds employed about the establishment, including mechanics, watchmen, and inspectors, divided also into classes in the same way, from $20 to $200. There are more than three thousand persons of the two classes, and the amount of these legacies alone is much beyond $3,000,000.

—Besides these great sums, she also leaves to the *Société civile* her favorite country residence at Fontenay-aux-Roses near Paris, valued at $200,000, to establish there a convalescent hospital and refuge in old age for the employees, and for its use an additional sum of more than $120,000. Her estate at Bellême, her husband's native place, together with a large sum of money, in all more than $120,000, she leaves for an asylum for the old women, and for the establishment of workshops for the young girls of the place. To two societies for the benefit of young workmen, and one for young workingwomen in Paris, she gives $400,000, and to five charitable associations of artists, musicians, actors, teachers, etc., and also to the "individualités souffrantes de la Presse parisienne," $120,000, in sums of $20,000 to each. Besides making the *Assistance publique* of Paris her residuary legatee, she leaves, beyond all these bequests, for other specified charitable purposes, more than $1,275,000, of which $100,000 is distributed among the "ministres des divers cultes reconnus en France," the Archbishop of Paris, the grand Rabbi of France, the presidents of the consistories of the confession of Augsburg and of the *Église réformée*, and the representative of the orthodox religious interests in Paris. These are not all her objects of interest even among what may be called her public bequests, for her numerous legacies to relatives and friends are not published; but they are enough to show the breadth and intelligence of her sympathies and the liberality of her mind as well as of her heart. It is not strange that there should have been an immediate proposal, upon the publication of this will, which so nobly crowns her life's labors, to erect a monument to Mme. Boucicaut in the square on which the buildings of the Bon Marché front. It was well said editorially in the *Temps* that she had considered not less carefully and ably the good works she left behind her than she had in life the direction of her commercial affairs; and this blending of worldly wisdom and "otherworldly" wisdom, this combination of intelligence of the head and of the heart, certainly deserves a long commemoration in one way or another. The *Temps* does Americans the honor to consider such a disposal of wealth acquired in one generation as an example of republican virtue the like of which has hitherto been witnessed only in America and England. We fear

we have as yet nothing to compare with this example.

— About a year ago M. Henri Bouchot contributed to the "Bibliothèque de l'Enseignement des Beaux-Arts" an admirably clear and concise study of 'Le Livre—L'Illustration—La Reliure'; and now we have before us 'The Printed Book: its History, Illustration, and Adornment, from the Days of Gutenberg to the Present Time,' translated and enlarged from M. Bouchot's volume by Mr. Edward C. Bigmore (New York: Scribner & Welford). The translation is fair to middling, neither better nor worse than the average; although a French sentence like "La maison Hachette, fondée par un des normaliens du mouvement libéral, au commencement du siècle, fut avec Lahure la promotrice du relief ainsi compris et pratiqué," is not adequately represented by this English sentence: "The house of Hachette, founded by one of the normal teachers of the liberal movement, at the beginning of the century, was, together with Lahure, the promoter of relief so inclusive [*sic*] and practical [*sic*]." Yet it is only fair to say that blundering of this sort is not frequent. The enlargement announced on the title-page consists in little more than the addition of a few English illustrations—in the double sense of the word. It would have been well and easy for the English translator to have enlarged the French author's meagre paragraph about commercial binding, the machine-stamped cloth-covering which the English early developed, and in which they are even now excelled only by the best American work. The translator's references to the United States are inadequate and ignorant, but good-natured and well-meaning. The cuts are not as carefully printed as in the original French book. But, making due allowance for these blemishes, 'The Printed Book' is one of the best volumes about the history of bookmaking now accessible in English; perhaps it is not too much to say that it is quite the best, for we do not know where to look for another book covering just the same field. It is to be noted in favor of the translator that he has supplied an index of sixteen columns.

MR. ROBERT LOUIS STEVENSON'S COLLECTED PAPERS.

Virginibus Puerisque, and Other Papers.—Memories and Portraits. By Robert Louis Stevenson. Charles Scribner's Sons. 1887.

These two volumes, with a third, 'Familiar Studies of Men and Books,' already noticed, contain the author's history, not in an explicit and formal way, as if he had deliberately set himself down to a narrative of his life and opinions, but as one may gather in conversation with some frank stranger the incidents and views which make his life and his soul his own. The world is not told, but the reader is allowed some degree of intimacy, or so it seems; and this is the secret of those felicitous essayists, the best fireside companions, who, talking of intellectual things, keep telling us something out of their own life by the way, and win our confidence by giving us their own. Mr. Stevenson is a lover of the old masters of the art, and rambles with the fashion of their gait; one feels often enough that he has not been long from Montaigne's company, or that he has left Hazlitt in the lane, as indeed he acknowledges, with a certain pride in the acquaintance and in the thought that he has studied their air. But the personal element, his own individuality, is there, too, and gives to these little papers, in spite of their remarkable unevenness in literary quality, the physiognomy of the author, as boy and man. He has one great characteristic of the good autobiographer in the fact that he is very interesting to himself; the things most closely connected with his own doings hold the next place; and everything else comes far behind. Those youthful papers which deal with generalities of life, are not to be used in denial of this preoccupation; youth is not less self-absorbed because it does not know enough to be specific. In his warm vindication of the claim of the young man to be as wise in his own generation as the declining Psalmist in his, and in the whimsies and paradoxes which he revolves about the subject of marriage in the very spirit of literary mischief, the self-assertion is only a lower degree of a decent kind of bumptiousness. He meant to present in these something that he could call "life at twenty-five"; but he grew old too soon to commit the deed outright, and so we get only a few specimens of his rawness, just enough to give a pleasing smartness to the taste.

Mr. Stevenson announces himself at once as a Scotchman by ancestry and tradition, by landscape, college, and humor, and by a certain physical toughness and wild-weather feeling, hard to define, which is never far to seek in his pages. His fancy, taking a cue from heredity, makes a queer excursion in the sketch of "The Manse," devoted to a kind, sharp portrait of his "minister-grandfather," in which he goes hunting for half-a-dozen of his ascendants in his own instincts and impulses, and knows not whether it is more strange that he should carry about with him some fibres of the old man, or that there was in the cool old clergyman an "aboriginal frisking of the blood that was not his," and that the primeval one, "Probably Arboreal (scarce to be distinguished from a monkey), gambolled and chattered in the brain of the old divine." It pleases him to be humorous about it, but he tells his ancestry on both sides, with interest in their lives and just pride in the stock. His memoir of his father has a clear truthfulness and honesty in it, and a certain solemnity which sets it apart curiously from the other papers; and there are no more pleasing passages than those which describe his vacation at the island of Earraid, when his father and uncle were building the light at Dhu Heartach, or which elsewhere show him as his father's son.

In depicting the characters of others who stood about him in his boyhood he not only succeeds in making them lifelike, but he lends his own appreciation to our eyes, and we see them by the help of his memories and associations. They are Scotchmen of the type known through the world. None is better than the figure of Robert Hunter, once Sheriff of Dunbarton, but "whether originally big or little" is more than the youth could guess. At the first knowing he was "all fallen away and fallen in; crooked and shrunken; buckled into a stiff waistcoat for support; troubled by ailments which kept him hobbling in and out of the room; one foot gouty; a wig for decency, not for deception, on his head; close-shaved, except under the chin, and for that he never failed to apologize, for it went sore against the traditions of his life." Two stories are told of him, not to be passed over, one, that, being a moderate in religion, he was much struck by a conversation between two young lads, revivalists. "'H'm,' he would say, 'new to me, I have had—h'm—no such experience.' It struck him," adds Mr. Stevenson, "with a solemn philosophical interest that he, a Christian as he hoped, and a Christian of so old a standing, should hear these young fellows talking of his own subject, his own weapons that he had fought the battle of life with, and—'h'm—not understand.'" The other story springs from his fondness for Shakspere, of whom he was very fond, "but *Othello* had beaten him: 'that noble gentleman, and that noble lady—h'm—too painful for me.'" This is very charming characterization, and when passages like these are found in a book, they will endear it though they be few. But in one single essay the author has drawn a sketch of the general Scotch nature, especially as contrasted with the English, in country, education, and temperament, which within its limits is as speaking a bit of national portraiture as one will meet with in a twelvemonth. Englishmen, he says, don't know Scotland and don't care to know; they are as indescribably ignorant of the sister kingdom as of foreign countries; and by contrast the Scotchman's wonder at England as a land of the south, an Italy to his Switzerland, with warmth and populousness, and a fuller and softened civilization, and the earth made habitable for a more refined race, is brought home with an ingenuousness not far removed from pathos.

But all this, delightful as much of it is, is no more than the atmosphere of these recollections and meditations, and is incidental; the subject of the story is really Mr. Stevenson, the romancer. He was born so, to dream for himself in boyhood, and after a time for the world. These volumes are full of anecdotes of early days, records of lonely hours and the moments that are remembered in sensitive persons as experiences, hours of friendship and days of adventuring, and many a tell-tale mood over books and in the face of life. Yet there is no obtrusive forwardness in the confessions, and, after finishing the reading, perhaps one does not remember very much that is worth keeping fresh, does not seem to know a great deal about events and persons such as would fill the stage in a biography, but he does feel that he knows the author very well indeed. Of one thing he is certain, and that is that Mr. Stevenson became a romancer as the grass grows. The glimpse of his childhood in his delightful paper upon the "Penny Plain and Two-pence Colored," that is, on the juvenile play-books for the toy theatre; the chapter upon a certain graveyard, between a prison and a hotel, and overlooking screaming railways, line on line, where, he says, "in the hot fits of youth I came to be unhappy"; the landscapes, the rock or shore or moorland which were always calling to his brain to restore to them their story; the sheep-dogs and the Pentlands; the nooks seen and remembered from the windows of railway carriages in foreign lands; the journeyings on foot with health, and the happiness of slow dying at Mentone—all these things are of a piece: whether normal or morbid, they are the stirrings of the imagination in youth. There is felt, too, incessantly the strong contact of life on the pulses and nerves, as well as its touch on the brain. In some degree the purely physical, the athletic side, seems dwelt on with an excess of fulness: particularly in what are easily distinguished as the essays of "life at twenty-five," there is the note of youth in the eulogy of living and in the doctrine to obey the impulse, cost what it will, and not to be afraid of Pan. An open, hearty nature, daring, and sentimental, and sound, anxious—perhaps over-anxious—to have its share in life, greets us from the pages, and makes us acquainted with the young man before he became an author in his own right, and was still making strong friendships with books, not always the best, one thinks, but always sincere. He tells us what six of these have lasted, and are the inner circle of his intimates now: Scott ("one or two" of the novels, but we trust this

is a low estimate), Shakspere, Molière, Montaigne, 'The Egoist,' and the 'Vicomte de Bragelonne.' The list is one that provokes inferences, but let the reader draw them for himself; we have had our say once upon Mr. Stevenson's critical faculties, and once is quite enough. Now, his tastes are of interest as a merely personal matter. Evidently the reader of these six—shall we say men or books?—is most deeply interested in human character, in the play and the power of life; and from his remarks in this "Gossip on a Novel of Dumas's" and elsewhere it appears that he writes adventure because he enjoys incident and romance, and the picturesque in setting and action, just as genuinely and as unabashedly as when he was a boy and "a Jacobite would do," but "give me a highwayman and I was full to the brim."

It would be a pity if one of this literary temperament should not stand up and declare the faith that is in him and in mankind that a good story is a thing to be loved, though it grew up with as little regard to what is usual in life as Jack's beanstalk had for what is usual in beanstalks. Mr. Stevenson was a romantic boy; but just as maturity steals over the page, calming that turbulence of animal spirits and taming into a more becoming fashion the forward and somewhat pert rhetoric of the "twenty-five-year-older," so the romantic boy, with his starts and his enthusiasms and his "hot fits of youth," is slowly transmuted into the artist by that brooding of experience upon his life which now seems thought and again insight. He has a wide range of reflection, and his curiosity has travelled in many fields; but over and above that, helpful as it is, he likes to deal directly with the thing itself, and in his romance-reading and romance-writing he has come to an understanding for himself as to why men like to be entertained for an Arabian night, and why he plays the part of the entertainer, and neither the audience nor the showman is ashamed. It is a play, we know, that has run for a thousand and one nights, and it will still be going on when for him and for us all the lights are out; and what is the secret? It is not life; it is the art of depicting life. Mr. Stevenson knows and explains the difference between these two things, which cannot be confused, except through wilfulness or blindness, by any one who has tried his hand and got beyond the initial point of ignorance. He has many admirable sentences struck clear with the die of the workman who knows the craft in its intellectual laws as well as in its mechanical execution, by his mind as well as his hand. "A person or a character," he says, "is so much the better depicted as it rises clearer from material circumstance." He advises the young writer "in this age of the particular to remember the ages of the abstract, the great books of the past, the brave men that lived before Shakspere and before Balzac; and, as the root of the whole matter, let him bear in mind that his novel is not a transcript of life, to be judged by its exactitude, but a simplification of some side or point of life, to stand or fall by its significant simplicity."

All this was written before the issuing of the monthly encyclical from a leading novelist, and therefore Mr. Stevenson adds a special postscript with reference to him who has made himself the challenger in the lists—"one well worthy of mention, Mr. W. D. Howells; and none ever couched a lance with narrower convictions. His own work and those of his pupils and masters singly occupy his mind; he is the bond-slave, the zealot of his school; he dreams of an advance in art like what there is in science; he thinks of past things as radically dead; he thinks a thing can be outlived—a strange immersion in his own history! a strange forgetfulness of the history of the race!" And then, with well-chosen words of compliment, in which he takes the view advanced also in these columns long ago that Mr. Howells succeeded better in the days when he still tolerated his own imagination, he closes the volume of 'Memories and Portraits' with which this notice has principally been concerned, because it is the maturer and the richer of the two beyond any comparison, except of ripe with green though reddening fruit. The book itself is most attractive in its temper, most interesting in its personal anecdotes and touches of sentiment and enthusiasm, thoughtful when it touches upon serious things, and always entertaining; but most of all it gives pleasure by that indescribable intimacy which is the charm of its autobiographical passages.

THE DALMATIAN SHORE.

Dalmatia, the Quarnero, and Istria, with Cettigne in Montenegro and the Island of Grado. By T. G. Jackson, M.A., F.S.A., Honorary Fellow of Wadham College, Oxford, architect, author of 'Modern Gothic Architecture.' 3 vols. Oxford: Clarendon Press; New York: Macmillan & Co.

It would be hard to name a people who have followed the path of progress over more obstructions than the population which lines the eastern shore of the Adriatic. They have but a narrow strip of coast, sloping down from the crest of the Illyrian Alps to the sea, here a mile wide, there expanding to a score or two. The land is inhospitable—white and stony, with patches of thin soil and scanty vegetation, and ill supplied with water. Its one natural advantage is in its indented shore line, on which lie nearly all the good harbors of the Adriatic, with spots of lowland or practicable slopes for the lodgment of towns, and bold and land-locked anchorages, joined by long reaches of quiet water which the outlying islands shelter from the waves of the open sea.

It is to her harbors and not to her lands that Dalmatia has owed what prosperity she has had. Greek and Roman maritime colonies founded her cities; their flourishing time was that of the Roman Empire; their interval of good fortune in the middle ages was when they were allowed, and were content, to carry on their commerce quietly under the guardianship of Venice. Such revival as they have had in our day has come with the order maintained and the commercial activity stimulated under the too paternal government of Austria. No communities ever had more need of tranquillity and union against outside aggression; but these conditions have been lacking since the fall of the Roman Empire. Union they have never sought; tranquillity they have never maintained. Cities as close as Trau and Spalato, when not forced into union by pressure of common enemies, could not get along without flying at each other, and outside aggression was never wanting. The barbarian invasions of the seventh century swept away the accumulations of Roman civilization. When the wasted cities began to recover, what with the equivocal protection of the Byzantine Empire, the maritime jealousy and encroachments of Venice, the depredations of pirates, the aggressions of Servia, Croatia, and Bosnia, the long arm of the kings of Hungary, the incursions of Saracens and Turks, the wonder is that any commerce and any opportunity for growth were left. Indeed, the history of these cities is a catalogue of invasions, spoliations, destructions by foreign enemies or vindictive friends, varied by quarrels between city and city, and the natural calamities of fire, pestilence, and earthquake.

To their difficulties of position has been added the embarrassment of a dual nationality. In Roman days the population was comparatively homogeneous, and after the cities had been swept away by the Avars and Slavs, the men who rebuilt them were still the old Latin or Dalmatian race, Italian by instinct, education, civilization, and language. To our day in most of the towns the Latin element has preponderated. From Italy have come their arts, their forms of government, their dress, their jurisprudence. They have spoken the Italian tongue, imported their teachers, their architects, many of their rulers and clergy, from Italy. On the other hand, the Slavs—Croats and Serbs—who from the tenth century have had possession of the interior, soon crowded about the cities, filtering into the population, and becoming a more or less considerable element of it, and, in the most southern of them, Ragusa and Cattaro, even becoming predominant. Yet they have by preference occupied the outlying territory of the various cities, living as peasantry on the ridges and slopes behind and between them. These two elements have survived side by side and distinct—the Latins, assimilated to the people of western Europe in civilization, the progressive, constructive part of the population, cosmopolitan in feeling, bearing the burden of commerce, civilization, and law; the Slavic, affiliated to their inland and eastern neighbors, intensely national, picturesque, martial, turbulent, providing apparently most of the hot water in which their country has spent its life.

Under these conditions the cities of the Dalmatian coast have kept up their struggle for existence during a thousand years. Their history has been insignificant because, with a genius for disintegration equal to that of the ancient Greeks, they have never even attempted to form a nation. Yet this history is made interesting by their unflagging effort to keep each by each their independence. Unable to stand alone, joined mostly to Venice by their common commercial instinct and by her preponderance, they were constantly snatched from her by some powerful neighbor, or revolting and shifting from one power to another as either seemed to give them better protection or more freedom, always with an eye to their own autonomy. Ragusa alone succeeded in maintaining herself apart as a curiously aristocratic republic from the beginning of the fifteenth century till Napoleon snuffed her out at the beginning of the nineteenth; and after him, like the others, she fell under the power of Austria.

The details of this history are abundantly set forth in Mr. Jackson's volumes. It is a tangled story, the product evidently of laborious research. If it errs, it is on the side of fulness. The general narrative is necessarily condensed, and the details overload it, at some cost of clearness and emphasis. But, for a pioneer history, this is to err on the right side. The plan of the book, including a general sketch of the country and its history, followed by an itinerary and detailed study of the principal towns, leads necessarily to some iteration, which, however, is no disadvantage to a reader who is not impatient, for it tends to fix and accentuate his recollection of a difficult and intricate subject. The art of Dalmatia and its neighbors takes most of Mr. Jackson's attention. It is pretty much all in the keeping of the Church, or rather churches (for the Latin and Greek churches divide the population between them), and is mainly architecture, though with a good store

of church furniture and the indispensable relics; the silversmith's work being especially noteworthy. It is described with an intelligent, even professional, minuteness which makes it the most thorough account of Dalmatian art that can be found, we believe, and will yield great satisfaction to readers whose interest has been stimulated by Mr. Freeman's suggestive sketches.

The art of this country is almost as intricate a study as its history. The Roman architecture is, of course, perfectly distinct; but except the remains at Spalato and at Pola, which are well known, scarcely anything exists, and nothing of importance. Eitelberger, indeed, in his book on the monuments of Dalmatia, argues *à priori* that the possession of abundant remains of Roman work must have had great effect in giving form to later Dalmatian architecture, and maintains also that "one finds everywhere, even in the mediæval buildings, the influence of the Roman prototypes"; but except for Spalato, where by an unparalleled chance the Roman structures have been preserved and used to this day, the published examples seem to us to show no more traces of Roman influence than lingered everywhere in the south of Europe. Our impression is that the Church of the monastic epoch, the mother of mediæval architecture, looked upon Roman buildings with abhorrence, and the singular way in which the great Church of San Donato at Zara is built on random heaps of Roman fragments contemptuously tossed together into foundations, seems to show that there was no reverence for it at that time in Dalmatia. That time was apparently the beginning of the ninth century; and there are no older monuments of Christian art in Dalmatia itself. For pure early Byzantine work we must look to Istria, where the well-known basilica of Parenzo is quite worthy of a place in Ravenna.

The succeeding period of Byzantine rule has left only a few rude later churches like San Donato, records of the efforts of an impoverished people to renew their worship. The more ambitious architecture begins with the transfer of sovereignty to Venice in the twelfth century, when a new season of prosperity had set in. The Dalmatian towns retained something of Byzantine detail in all their later building; but the intermittent supremacy of Hungary, and the admixture, in some towns the predominance, of a Slavic population, introduced other influences, so that the art of Dalmatia as it comes down to us is an intricate compound of Byzantine, Italian, German, and Slavic elements. As the chief civilizing influence was that of the Latin half of the population, and as the prevalent sovereignty, on the whole, was that of Venice, so the prevailing character of the architecture is always Italian, and yet it is often not Venetian. The Cathedral of Zara, consecrated in 1285, when Venetian influence was paramount, has a façade that might almost have been imported from Pisa or Lucca, and a plan that might be Lombard or German; the Cathedral at Sebenico is of two periods of almost pure Venetian architecture; that at Trau, built chiefly by a Florentine bishop under Hungarian rule, has a porch of very Tuscan character, perhaps the most beautiful architectural feature in Dalmatia, while the eastern end is so German as to provoke Mr. Jackson to parallel it with the church at Ják in Hungary. The great bell-tower at Spalato, built also by the Hungarians, is a curious mixture of Romanesque and belated classic, although ascribed to the fourteenth century. The adjoining cathedral, which is well known as one of the temples, or more probably the mausoleum, of Diocletian's palace, has a pair of magnificent doors, and a rich pulpit of pure Romanesque work, which elsewhere one would unhesitatingly assign to the twelfth century, but the doors bear date 1214; the choir-stalls, which Mr. Jackson classes with them, are backed with a lattice of spool-work apparently copied from Cairo. Indeed, what with the eclectic habits and shifting rulers of the Dalmatians, who had no native artistic traditions, and the modifying tendency to cling to old forms which belongs especially to provincial peoples, the chronological order of Dalmatian art is exceedingly hard to follow. There is, on the whole, in the larger work less of Byzantine character than we might look for; but in the fittings of the churches, in the carvings and smaller objects, and most of all in the silversmith's work, it is recognizable at all periods.

Mr. Jackson has excellent qualifications for his work. He is a scholar, understands the languages which bear on the work, and has the instinct of research, as well as, we should think, good historical judgment. He is an architect, knowing the history of art and of styles, and an admirable draughtsman. How good a draughtsman he is may be seen by comparing some of his drawings, which are facsimiled in his book, with plates of the same subjects in Eitelberger's 'Dalmatia,' and in that writer's contributions to the 'Kunstdenkmale des Oesterreichischen Kaiserstaates.' We notice some differences which illustrate the unaccountable variations of testimony that appear between apparently careful witnesses even where the original fact must, it would seem, be perfectly definite; in these cases Mr. Jackson's drawings, it is fair to say, carry the greater appearance of veracity. He writes simply and agreeably. The slight story of travel which unites his architectural descriptions is fresh and entertaining, without being obtruded, and he has a knack of using words that set forth with happy distinctness the impression or form he wishes to present.

This book, and Mr. Butler's 'Coptic Churches,' which we noticed some time ago, are contributions of real value to history in little known fields of architecture and its kindred arts. The growing interest of Englishmen in the Levant makes them timely. Mr. Freeman's enthusiasm had already lent attraction to the towns of Dalmatia. In the light of Mr. Jackson's pictures, one wonders how long it will be before the fleet of English yachts that rove about the Mediterranean will find out the charms of her inland waters and picturesque coast, and the English tourist be busy raising the prices and spoiling the wines of her inns.

THE ANTE-BELLUM SOUTH.

Memorials of a Southern Planter. By Susan Dabney Smedes. Baltimore: Cushings & Bailey.

Southern Silhouettes. By Jeannette H. Walworth. Henry Holt & Co.

Thomas Smith Dabney, the memorials of whose life are presented as above by his daughter, was born of a well-known Virginian family in 1798, was reared and educated after the Virginian manner of the time, won local prominence early in life, and was so highly esteemed by his neighbors that when, in 1835, he decided to emigrate to Mississippi, it is easy to see, even at this distance, through the grotesque rhetoric of the orators at the dinner given in his honor, that there was sincere sorrow in the community that so good a man should go away. And his friends in Mississippi had reason to congratulate themselves (and the State, which was never forgotten on congratulatory occasions) that so upright a man had come among them. He bought a plantation there, whereto his family and slaves were removed; and there they made their home till the slaves were freed and the fallen fortunes of the family scattered its members. Mr. Dabney was a brave man in his poverty, and a charming dignity crowned his old age. His last years were spent with his daughters in Baltimore, where he died in 1885.

The life of a Southern planter that covered so long a period gives a chance for as interesting a picture of old Southern manners as the writer of any recent book has had. And in truth there is in this volume nothing of the straining after something "typical" of that old life with which readers of books nowadays who know something of what old Southern life was, have become painfully familiar. Mrs. Smedes's own recollections, and the facts got from friends and kinspeople and from letters, are material in abundance, and the career of her father was sufficiently "typical" to satisfy the most insatiate yearning for types. She tells the story of his life well enough to make a good sketch of the man, who was worth knowing on his own account, and a good picture of Southern civilization in the time of slavery. All who are interested to get a knowledge of what that civilization was, will find this one of the most helpful of recent books, and for this reason it has even an historical value.

But its value is less than it would have been if Mrs. Smedes had been able to rid herself of the feeling that, incidentally at least, she must vindicate the slaveholder (to use a word of the politicians). A Southern critic must ask leave here to remind other Southern writers than Mrs. Smedes that, from a literary point of view and for all the healthful uses of literature, vindication, in this sense, is a simple confession of narrowness of artistic vision. Throughout this volume, for instance, grotesque emphasis is laid on the fact that Thomas Dabney was a kind master, and that most Southern masters were kind. The reader would find relief if one brute should come into view who took his pastime with horsewhips and bloodhounds. Yet no one could read the record of such a life as this and imagine that the man was a cruel master; and nobody now needs to be informed that all Southern planters did not maltreat their slaves, or even that the maltreatment of slaves brought discredit on a man. It is a misfortune that Mrs. Smedes has recollection of the controversial aspect of subjects she must touch, for this controversial tradition makes a bad artistic blemish in an interesting narrative. The result is, she uses her chance ill to give the descriptive parts of her book the charm that every book descriptive of that life must have, or fail in one important respect—she shows too little appreciation of its cheerful phases or of its humor. The old Southern planter had his full share of dignity in his way, no doubt, but he likewise had a good share of cheerfulness. He enjoyed life keenly and he knew the art of adding to the enjoyment of others. A moralist could even find historical ground for condemning him for his jollity. But tradition, helped greatly by his Southern biographers, has so emphasized his dignity (or his pomposity), even in his pleasures, that one of the cheerfulest types of men we have bred seems likely to be regarded, almost before his mirth is ended, as a man of painful and dangerous dignity. Mr. Dabney surely was a cheerful man, and we are told so in these memorials; but the pages of the book have not caught the joyousness of his life.

While there is no good reason to think that dialect, either of the negro or of the illiterate whites, is necessary for the portrayal of the

cheerful side of Southern life and its humor, yet it is true that, with one important exception presently to be noticed, only those Southern writers who have written in dialect, such as Mr. Harris and Mr. Thomas Nelson Page, or about gawky countrymen, of whom Mr. Richard Malcolm Johnson is easily the best, have made true descriptions of ante-bellum manners. For some reason, whether a lack of humor or a desire to "vindicate" somebody be the true reason or not, those who have set out to write serious books have ended by writing very solemn ones; and Mrs. Smedes has fallen, even if not deeply, into this pit. Mr. Dabney was not a great man, nor does she say that he was, but she tells insignificant incidents of his life in a way that tempts you to remind her that he was not a great man, and to ask her whether he were not sometimes undignified, or even frivolous.

Nor are there glimpses enough of the life about him. Little is said of his neighbors, and nothing of what they did or what they thought. Insight is seldom given into the influences that shaped his life, and, but for the geographical names, the book might be about an Australian instead of an American. There is an insufficient background, and this lack leaves a feeling of incompleteness. In 'Uncle Remus,' for instance, one meets "Miss Sally," and becomes aware of the sparsely settled country, the occupations of the different classes of people, and the very furniture of the cabin. The range of the thought of the white folks is reflected in the old man's rhetorical figures, and the little boy that listens shows, by his occasional questions, all the characteristic influences of life in the "big house." There is nothing analogous to this in these 'Memorials.' The man is removed from the people about him, and, instead of getting an insight into life on a Mississippi plantation, the reader is puzzled to know how so sympathetic and kind a man had so little to do with his neighbors. Few persons are met in the book other than the members of his family and the distinguished men he entertained.

The very quality that Mrs. Smedes's 'Memorials of a Southern Planter' lacks is the distinguishing quality of Mrs. Walworth's sketches. 'Southern Silhouettes' is not a narrative nor a description that has the unity of a biography, but a group of pictures of more or less heterogeneous phases of old Southern life, written to be read one at a time as they appeared in the *Evening Post*. This volume, therefore, lacks something of the serious value and of the serious purpose of the other; but it lacks also the other's solemnity. The pictures are clearly and daintily drawn, and they are truthful even in their humor. The reader becomes acquainted with the whole neighborhood, and the neighborhood was the unit of Southern life, and yet is. There is no interesting person within the acquaintance of the people in the book who does not find occasion, naturally if not always gracefully, to come within the circle of the reader's knowledge. As sketches, these 'Silhouettes' come as near to the carrying out of Mrs. Walworth's purpose as sketches can; and her aim, as she explains it, is, as "one who was part and parcel of the old order of things in the South," to "put on record the story of a day that is dead."

THE ORIGIN OF MYTHS.

Myth, Ritual, and Religion. By Andrew Lang. Longmans, Green & Co. 1887. 2 vols. 8vo, pp. xvi, 340; vii, 373.

THE work before us is the last stage of a series of brilliant studies scattered through periodical and encyclopædia, some of which have been collected in 'Custom and Myth,' and all of which are links that the deft hand of the writer has here forged into a strong and compact chain of argument. A subject of the most serious thought, which has occupied the attention of philosophers and scholars for centuries, is here treated in the most serious manner, but with that remarkable clearness and literary skill, characteristic of the author, which makes these volumes delightful as well as profitable reading.

The object of the work is no less a one than to account for some of the peculiar features of religion and mythology which have puzzled man from the moment he began to reason at all about these matters. The cruel, obscene, and wholly irrational elements which abound in mythology have been explained in various ways from the time of Socrates down, but no system, until Mr. Lang's, has been invented which is of universal application, or which is not inconsistent with itself. The symbolical and the philological methods of interpretation have found most favor in our day, and the latter has been peculiarly fortunate in having for its advocates such scholars as Max Müller, Kuhn, Cox, and De Gubernatis, who have presented the results of their studies in a form attractive to a wide circle of readers. Neither method has produced satisfactory results. The partisans of the philological system of explanation are not agreed among themselves on the most fundamental principles; they resolve all mythology into a description of the phenomena of nature; but while some are inclined to consider the recurrence of day and night as the phenomena in question, others make the strife of the elements the basis of myths. This system, besides being of limited application (the myths of the Aryan peoples alone lending themselves to the comparative philological method), is full of absurdity when carried to its logical results. The "solar myth" theory has been applied in turn to the general mythology of the Aryan peoples, to their epic poetry and popular tales (Cox), and, finally, to their zoölogy and botany (De Gubernatis); but in some of its fields the theory has utterly broken down before the light of recent discoveries, and the inconsistencies of which it is guilty at its best long ago brought it into disrepute among scholars.

The system propounded in Mr. Lang's work, like all others, reflects the spirit of the age. Just as the philological method grew out of the revival of the study of language caused by the rediscovery of Sanskrit by European scholars in the early part of this century, and the establishment of the comparative method by Bopp, so Mr. Lang's theory is the outcome of the modern method of anthropological study, which has already borne good fruit in the works of Mr. E. B. Tylor. The great difficulty with the older theories was that they supposed that man, in the myth-making stage of his existence, was in an advanced intellectual condition, and for some reason expressed his ideas in the curious terms of mythological allegory. The new theory proposes to show, in Mr. Lang's words, that "the human mind has passed through a condition quite unlike that of civilized man—a condition in which things seemed natural and rational that now appear unnatural and devoid of reason, and in which, therefore, if myths were evolved, they would, if they survived into civilization, be such as civilized men find strange and perplexing."

The first question naturally is, whether there "is a stage of human society and of the human intellect in which facts that appear to us monstrous and irrational—facts corresponding to the wilder incidents of myth—are accepted as ordinary occurrences of every-day life." This stage Mr. Lang finds in the condition of savagery through which man has passed, and it makes no difference whether we consider this condition the primitive one of man or not; it is enough that man has at some time passed through it and retained reminiscences of it in a subsequent more civilized state. In a word, Mr. Lang's theory is "that the savage and senseless element in mythology is, for the most part, a legacy from ancestors of the civilized races who were once in an intellectual state not higher, but probably lower, than that of the Australians, Bushmen, Red Indians, the lower races of South America, and other worse than barbaric peoples." The question why savages entertain the irrational ideas which survive in myths Mr. Lang does not stop to discuss, but briefly remarks that their intellectual powers are not fully developed, and hasty analogy from their own unreasoned consciousness is their chief guide. This important question must some day be met, but as it is more a psychological than an anthropological one, we suspect Mr. Lang's interest in it is less.

We have not space to follow in detail Mr. Lang's argument. He first selects a few peculiarities of savage thought, such as the tendency of the savage to consider himself akin to animals and plants and heavenly bodies, and assign human speech and feeling to them; belief in magic and sorcery; belief in the existence of the souls of the dead and power to conjure them up; the belief that a man's spirit may dwell in a particular part of his frame and be detached and roam about—that death is caused by some hostile spirit or conjurer; and, finally, the spirit of curiosity which leads the savage to account for the world about him. These points Mr. Lang proceeds to prove by a mass of quotations from reports of travellers, missionaries, etc. After he has established these peculiarities of savage thought, he examines in their light the class of nature myths, myths of the origin of the world and of man, and finally divine myths. These various classes of myths Mr. Lang traces first among savage peoples, and then among civilized races, and shows how the same elements are found in all, and often the most remarkable resemblances in point of belief, custom, and ritual.

The evidence is cumulative, and as the reader advances it is impossible to resist the conviction that Mr. Lang's theory is more plausible than any that has yet been offered. Still, it will not do to press it too far. The author is himself aware of its limitations. The myths of many peoples he has not yet investigated, and his theory at best accounts for only a part of mythology. To us the most interesting part of the work is that relating to the question of the origin and diffusion of popular tales, and as this question is just now one of growing interest, we cannot refrain from a brief account of this novel application of Mr. Lang's theory. While the Grimms were collecting their 'Household Tales' they were struck by the resemblance between many episodes in them and in Indo-Aryan mythology, but it was reserved for later writers, notably Cox and De Gubernatis, to make popular tales an integral part of that mythology, generally on the theory that they were the débris of myths. This theory accounted for their diffusion just as for that of the mythology from which they were evolved, by the dispersion of the Aryan peoples. The other theory, finding a striking resemblance between these tales and those of India, concluded that the popular tales of Europe had been brought from India within

historic times, and diffused chiefly through channels of written literature. Both theories have broken down under the discovery that the popular tales of all peoples, Aryan and non-Aryan, civilized and savage, are practically the same (which disposes of the Grimm theory), and that there were popular tales long before there was an historic India, as was shown by the Egyptian tales published by Maspero in 1882, which disposes of the Benfey theory. We say these theories have broken down, we mean as *theories*, for there is doubtless some truth still left in each. That popular tales constitute a class apart, Mr. Lang readily admits: "They do not, like nature myths or divine myths, seek to account for the origin of things. They are romances or novels, and if they do explain anything, it is rather the origin or sanction of some human law or custom than the cause of any natural phenomenon that they expound." While Mr. Lang is not inclined to see in popular tales the débris of his savage mythology, he still thinks they are in the main survivals from a state of savagery, and may to a large extent be explained by the customs of savages. The minute application of the theory to popular tales is not made in the present work, but must be sought in Mr. Lang's introduction to Mrs. Hunt's translation of Grimm's 'Household Tales' (London: C. Bell & Sons, 1884, 2 vols. —the only complete translation of Grimm with the notes of the author), and to that most dainty of books, 'The Marriage of Cupid and Psyche' (London: David Nutt, 1887).

Mr. Lang's conclusions are not very positive. The supernatural *stuff* of the stories, as he says, "the threads of the texture, the belief in the life and personality of all things—in talking beasts and trees, in magical powers, in the possibility of visiting the dead—must, on our theory as already set forth, be found wherever men have passed through savagery and retained survivals of their intellectual condition, and wherever they have borrowed or imitated such survivals." This accounts for the similarity of the material of heroic myths and *Märchen*, but does not account for the similarity of *plot*, nor is the question much advanced by the suggestion that after all there may be no plot. Those who have worked through great collections of popular tales know that the most remarkable thing is precisely the well-defined plot, and the extraordinary resemblance in this respect of all Aryan popular tales. We say Aryan advisedly, for there is no such close resemblance between them and the savage tales. It is very hard to avoid the conclusion that the popular tales of Europe, at least, have come from some original centre, and that most of them were invented only once for all. May there not still be more truth in the Benfey theory than Mr. Lang is willing to admit? May not the popular tales of Europe at least have been powerfully influenced by the introduction of Indian stories, and may not the ruder preëxisting forms have taken on a more orderly shape? Mr. Lang's only conclusion is, that

> "what remains to do is to confess ignorance of the original centre of the *Märchen*, and inability to decide dogmatically which stories must have been invented only once for all, and which may have come together by the mere blending of the universal element of imagination. It is only certain that no limit can be put to a story's power of flight *per ora virum*."

We cannot take leave of these interesting volumes without again expressing our admiration for the scholarship and literary graces of the author. It is too much the fault of the day to neglect all literary style in serious composition. Mr. Lang shows us how to be serious and attractive at the same time.

DR. SAMUEL GROSS.

Autobiography of Samuel D. Gross, M. D., etc., etc., with sketches of his contemporaries. Edited by his sons. 2 vols., 8vo. Philadelphia: George Barrie. 1887.

THE profession of medicine is at a disadvantage in comparison with law and divinity, in that as a rule its disciples deal with units and not with groups or masses of men. The clergyman is constantly before the community, and is, at least in theory, an intellectual leader, a light set on a hill. Much of the lawyer's distinctive work lies in arguments and appeals made in public, and, in this country at least, the highest seats of administrative and executive power are practically reserved for members of the bar. The mechanical professions of architecture and engineering spread the fame of their members by works seen of all men, while journalism and the fine arts, each in its way, appeal to a popular verdict.

It is not so in medicine. A physician's reputation is acquired by the practical result of study as demonstrated on individuals, and under conditions that usually forbid general attention being drawn to it. At the best it is confined to a locality so small that he must have the personal acquaintance of nearly every admirer, and there is no legitimate appeal to the community at large. When the public attempts to gauge medical merit, it frequently misconstrues deportment as erudition, and mistakes the recuperative power of nature or the inevitable course of disease for skill or the absence of it in the physician. It is this working with unknown quantities upon solitary subjects that so limits the renown of medical men. And on this account probably not one reader of these lines in five hundred, not himself a physician, can name outside of his own town one man eminent in medicine to fifty of reputation if not of fame in other walks of life.

Within the limits of his own practice a successful physician is implicitly trusted and greatly beloved, but his hold upon the community is one of affection, like that of an enlarged domestic circle. It is not fame; it fades with him, and at best rarely survives the personal recipients of his service. Nevertheless, in this general neutral tint of professional dulness an infrequent picturesque color greets the eye; out of the ill-defined haze that covers the working multitude of doctors an occasional figure rises to challenge and to receive attention. Within the natural circle of their vicinage those who practise surgery, the branch of medical art that most directly appeals to the senses, become more widely known, and because of the appreciable nature of their exploits the radius of their reputation is the more rapidly and the further produced. The authors of successful professional books acquire esoteric fame that sometimes uncertainly vibrates in the popular ear, but teachers in the lecture-room are still better and wider known, and for a long time their students worship at their shrines. It is chiefly through these willing satellites that the central light is extended.

Notwithstanding the disadvantages enveloping the average practitioner, there are, therefore, a few physicians who acquire both popular reputation and the actual homage of the learned; men whose natural ability, strong character, and efficient worth raise them into the front rank. One of the best illustrations of this happy combination was the late Dr. Gross. Besides domestic honors, he received abroad the D.C.L. of Oxford and the LL.D. of both Cambridge and Edinburgh, and is therefore a conspicuous example of eminence recognized by the schools. Filling in succession chairs in Cincinnati, Louisville, and Philadelphia, he was a public teacher for forty-eight years, a skilful and busy practitioner of medicine and surgery for a still longer period, and during the whole time a constant and careful author, so that, as one of his biographers has written, "it is safe to say that no previous medical teacher or author on this continent exercises such a widespread and commanding influence as did Professor Gross." For the instructive history of his career, his aspirations, his struggles, his success—he appears to have had no real failures—we are indebted to a certain public spirit, and possibly to a pardonable pride in his own achievements as well as to his fortunately facile pen. Conscious that his long and active life might be an example, at the age of seventy he commenced the detailed rehearsal of its course, expressing intercurrently with much candor and considerable shrewdness his estimates of many contemporaries, and noting his views upon many public and social questions by the way. In the form of a diary this was continued until within a few weeks of his death, ten years later, in the spring of 1884.

Dr. Gross certainly was a great man. His strength of character appeared when, at less than fourteen years of age, finding card-playing as an amusement becoming too fascinating, he deliberately resolved not to play for twenty years, and he kept his resolution. Again, after beginning the study of medicine, he satisfied himself that his general education was insufficient, and accordingly he closed his professional books and returned to school. His characteristics were energetic and conscientious thoroughness, and self-reliance based thereon. He appears to have constantly kept in mind the responsibilities of his position, to have carefully prepared to meet them, and then fearlessly to have undertaken whatever presented. By his own estimate the genius he possessed was "the genius of industry"; but he had more than that—he had a strong mind and a good heart, and the two always worked in accord.

When he was not in the front rank, he was ahead of it, as for example in 1843, in his monograph on the 'Nature and Treatment of Wounds of the Intestines,' he foreshadowed the very latest and most successful methods of dealing with those grave injuries—methods that have found a practical expression since his death. His 'Pathological Anatomy,' published in 1839, was the first work of its kind in English, and gave him deserved fame abroad as well as at home. He was a voluminous writer all his days, and it is not flattery to say that every professional paper was so carefully prepared as to be of as substantial and lasting value as the shifting boundaries of medical science allow. For it is the misfortune of such works, in common with those of other sciences, that after death holds the author's hand they remain as guide-posts, not as terminal monuments. Subject to such limitations, his 'System of Surgery,' his greatest work, will be for years authority.

Dr. Gross's fame will rest upon his professional achievements; but this autobiographical deliverance of so active a mind should find many admirers, and in the future will serve as a map of contemporaneous society. Very naturally, his profession is the warp of these sheets, but in the weft are woven many figures where actors and deeds and opinions bearing upon the whole round of modern life appear. Social, religious, and economical views are freely expressed, and it is very interesting to follow the operation of such a mind among these themes. Perhaps the most practically important of these is his judgment of cremation, which is favorable; and by the authority of his will he caused

his own remains to undergo the purification by fire instead of the dishonor of underground putrefaction. A city graveyard he properly styles "a relic of barbarism of the worst kind." Among the many biographical notices and the numerous dates and names introduced we observe no really serious errors, although in a book written by one physician and edited by another, where, as is evident, the proof has been most carefully read, Sternberger should not be allowed to stand for Dr. Sternberg's name. Dr. Gross refers to Macadam, the road-making engineer, as an American citizen, as he believed. Macadam's only connection with this country was a temporary residence, begun in 1770 and terminating in 1783, during the Revolutionary period of which he was a civil officer of the Crown.

Unquestionably Dr. Gross was a man of kind heart and good impulses, and he certainly thought himself considerate towards others, but there are at least two instances where the delicacy that finds its best expression in the Golden Rule was not displayed. In one case he saw for the first time fallen in drunken helplessness a well-known scientist, whom he elsewhere styles "great and good," and who was habitually a temperate man. But he embalms in print this mortifying fault, although the victim has been dead more than fifty years, and the incident had no special relevancy to the narrative. Surely our sins do haunt our memories. Again, he describes in detail the dress of the daughter of a well-known literary man who had accompanied her aged father to a certain assembly, and characterizes it as grotesque, as it certainly was. The lady is living; but, whether alive or not, it was certainly not in good taste to print such references to any woman, not herself seeking notoriety, and judicious editors would have omitted both these remarks.

The book is excellently made in every particular, and the energetic and somewhat aggressive author would be well pleased to see his last literary venture so well presented to the world. Besides giving pleasure to those whose positions are assured, it will probably act, as the writer hoped, "by stimulating the ambition of those who may come after him to work for the advancement of science and the amelioration of human suffering."

Von Luther bis Lessing. Sprachgeschichtliche Aufsätze von Friedrich Kluge. Strassburg: Karl J. Trübner, 1887.

Prof. Kluge, author of the well-known etymological dictionary, here gives us, in brief compass and very readable form, the results of his own careful examination of an interestiug and much mooted question of German philology, namely, the precise indebtedness of modern literary German to Luther and the Reformation. The prevailing tendency has long been to date the new High German standard language from Luther, and to regard him as the creator of it. In opposition to this view, Scherer dated the new language from about 1650, and ascribed the "epoch-making" influence to the grammarians Schottel and Gottsched. He regarded Luther as simply a prominent figure in what he called the "period of transition" from Middle to New High German, that is, the period from 1350 to 1650. Other writers besides Scherer have also endeavored to weaken the prestige of Luther as the creator of modern German. Brandt observes, in his Grammar, that "Luther's share in the establishment of the written language is generally not well stated and often overrated," and further calls attention to the fact that fourteen translations of the Vulgate Bible had been published in High German previous to the year 1518. The work before us, although a mere pamphlet, gives all the data necessary to enable the reader to form an independent judgment with regard to the matter at issue. It is based upon a careful study of old and long-forgotten prints that have been exhumed from public libraries here and there, and are now made to shed their peculiar light upon the linguistic conditions of the sixteenth century. The essays are not controversial in tone, but their whole tenor goes to show that the language now universally known as "German" really is, from an historical point of view, what Grimm called it, a Protestant dialect; and also that the influence of Martin Luther in giving shape to this dialect can hardly be overestimated. We must content ourselves here with indicating very briefly the general course of Kluge's interesting argument.

At the beginning of the sixteenth century there were three great obstacles to be overcome before anything like a national German language could start into existence. In the first place there was the supremacy of the Latin as the language of the Church and of scholarship. The cosmopolitan character of the Church seemed to require an international language, and the Latin not only served this purpose, but had also become in some sense the symbol of the Church's historical dignity. Thus the Church cast its influence in favor of the use of Latin for all literary purposes, and endeavored to foster the idea that the mother-tongue was not only vulgar and barbarous, but not comparable with the Latin as a means of expressing thought. How persistent and vigorous this opposition was, Kluge's quotations show conclusively. When, accordingly, the Wittenberg agitation began, it was Luther's language as well as his ecclesiastical views that drew upon him the hostile attention of the Church. And the reformer threw down the gage of linguistic battle as boldly as he had that of the battle theological. There is evidence that he fully foresaw the immense advantage that would come to his cause by connecting it with the use and advocacy of the mother tongue. Who can estimate the importance of the fact that the protest of the Wittenberg priest was thus allowed by the Church to take on more and more the aspect of a quarrel between the German people, the German heart, the German tongue, and a Latin-speaking priesthood directed from Rome? How distinctly and strongly the cause of Protestantism became identified with that of the German language, appears from the statistics of book-making for the early part of the sixteenth century. In 1512 there were 140 books printed in German; in 1513, 90; in 1514, 110; in 1515, 150; in 1516, 110; in 1517, 80 (it was on October 31, 1517, that the theses were nailed on the church door at Wittenberg); in 1518, 150: in 1519, 260; in 1520, 570; in 1521, 620; in 1522, 680; in 1523, 935; in 1524, 990. The history of Catholic opposition to the nascent national language is fully traced by Kluge. The last point to be surrendered was in regard to the use of the final e in such words as Blume, Krone. Even as late as 1782 a Catholic organ could still complain: "Es klang doch ehemals so genuinkatholisch die Seel, die Cron, die Sonn, die Blum u. s. w.—und nun schreiben die unsrigen fast durchgängig die Seele, die Krone, die Sonne, die Blume—wie die leibhaften Ketzer auch schreiben."

The second of the obstacles referred to above lay in the existence of numerous highly differentiated dialects. Tenacious local prejudices had to be overcome, and it was a long time before even Protestants in various parts of the empire could persuade themselves to write the language of Luther instead of their own local speech. During the entire sixteenth century comparatively little progress was made. The early reprints of the Bible contained glossaries in which words of Luther were explained in terms of the local vernacular. Among all the literary dialects, that of Zwingli and the Swiss reformers was most tenacious of life, though it was never a formidable competitor for the honor of becoming the standard literary idiom. Such a competitor did exist, however, in the official language (*Kanzleisprache*) of the Emperor Maximilian, which was in a fair way to become a generally accepted standard when its progress was checked by the dialect of the Reformation. What Kluge has undertaken to do is to follow the fortunes of Luther's language during the period in which it was becoming generally accepted as the literary standard; to recount in a somewhat popular form, and without going too much into philological details, the struggle of the new idiom with the Catholic Church, the dialects. and, later, with the Latinizing tendencies of the humanists.

Palæolithic Man in N. W. Middlesex. The Evidence of his Existence and the Physical Conditions under which he lived in Ealing and its Neighborhood, illustrated by the Condition and Culture Presented by certain existing Savages. By Jno. Allen Brown, F. G. S., F. R. G. S. Macmillan & Co. 1887. With a frontispiece and eight plates. Small 4to, pp. 227.

This book embodies the substance of eight papers concerning the prehistoric archæology exhibited in the northwestern portion of Middlesex, England. The neighborhood of Ealing has proved a very valuable region for the detailed study of prehistoric man, and much of our knowledge concerning the district in an archæological point of view is due to the persistent inquiries of the author of this treatise. Mr. Brown's aim is to show, by inferences based upon observed facts, the character of the geography at the time when man first appeared in the district, and the succession of events which have occurred since that time. He makes it evident that since the advent of man this region has been subjected to a considerable process of elevation, naturally accompanied by the continued down-cutting of the stream beds as the base level of erosion was altered.

The interest which the reader will have in this book must rest rather upon the importance of its subject than upon the shape in which that matter has been presented by the author. The failure to rework in a thorough way the matter set forth in his previous essays has led to an unhappy clumsiness of statement. Moreover, though large parts of the treatise rest upon careful observation made by himself and others, we find at many points a good deal that is conjectural. Such hypothetical work is well enough in its place, but it is not well to combine the statement of historic fact with guesswork as to the conditions of the environment which prevailed at the time these facts were recorded in the rocks.

To the general reader the most interesting chapters are those descriptive of the worked flints from the Ealing district, in which the author gives a clear account of the various implements used by the historic people of that district, and the chapter concerning the conditions of life presented by certain savages, now in a state of culture, apparently analogous to that of palæolithic men. In this last-named chapter, the author briefly and rather effectively sketches the condition of various people who at present use implements similar to

those which have come down to us from the palæolithic men. He fails, however, to note the important fact that the moral and social condition of peoples is in many cases inadequately represented by the condition of their technical or plastic arts, or at least those portions of such arts as have survived the ravages of time. There can hardly be a doubt that the Aryan folk in the later part of the stone age were generally in a very much higher state of culture than the Eskimo or the people of Tierra del Fuego. This difference in race characteristics must qualify all the conclusions which rest upon the art remains alone.

Electric Transmission of Energy. By Gilbert Kapp. D. Van Nostrand.

Electricity, for Public Schools and Colleges. By W. Larden, M.A. New York: Longmans, Green & Co. 1887.

Applied electricity has made rapid strides in the last few years, as is evidenced by the recent endowment of professorships for this subject in a large number of the leading technical institutions of the country, and also by the fact that dynamo electricity, practically unknown in the arts ten years ago, is now, under certain conditions, in electric lighting, in the storage battery, and in its use as a transmitter of power, an assured success. In the last-named capacity it has not made the advance of the electric light or of the storage battery. Numerous reasons might be assigned for this, but probably the principal cause has been the fact that electrical transmission of power has *resulted* from the introduction of the electric light, and that the cost of investigating and experimenting upon electrical motors has been a great detriment. In the majority of cases where the electric light is used in factories, warehouses, ferry-boats, etc., etc., the dynamos are run by power which is present in excess of the normal requirements. Under these conditions the electric light is more economical than any other; but no such saving can be shown in transferring electricity as a power, with the one exception that where a central station is established for the generation of the electricity for motive power, and this power is delivered to a number of engines, all of small power, the cost of running the central plant would be much less than that of the separate small boilers, engines, etc. Upon this point the author states:

"A steam engine of 100 horse-power, driving a dynamo in the centre of a two-mile circuit, could deliver an aggregate of 60 horse-power (allowing efficiency of dynamo to be 60 per cent.) in as many separate points within that circuit. Apart from all considerations of nuisance and cost of attendance, in the case of sixty separate small steam-engines placed throughout the district, which might be used instead of the sixty electro-motors, it is evident that we can generate 100 horse-power in one single engine at a far less cost of fuel than could be done in small engines; and although the double conversion necessitated by electrical distribution of energy entails some loss, there is still a large margin in the general economy of the system."

Under certain conditions this could even be improved upon, as, where the power used to run in the generating dynamo is water-power instead of coal, the cost would be trifling in comparison—in fact, the cost would simply be that of the original plant and repairs; and we predict success for this in the near future where small power is wanted. The convenience of the system is absolutely beyond comparison with the direct use of boilers, etc.; there is no heat, no smoke, no dirt; in one minute, if desired, the power is obtained from the central station, and in an instant shut off.

The chapter devoted to underground cables gives a résumé of the different devices in use, a somewhat lengthy explanation of induced currents, and the many mechanical obstacles that have rendered the majority of patented underground cables of little value for practical use. More attention has been given to this subject in this country than in England, and the advances here have been greater. The electric-light companies have been forced by ordinances, in many of our large cities, to face the future laying of all wires for electrical use in underground conduits.

The author has endeavored to make a somewhat difficult matter (the transmission of electrical energy) plain to those who wish to investigate the subject from a commercial standpoint, and the work will also be extensively consulted by electricians, as it is a careful and thorough treatise.

Mr. Larden's work is an exception to the great number of text-books on the same subject: it contains a large amount of new matter, and shows an admirable arrangement of text. Its bulk, and the small attention given to electricity in our public schools, make it a text-book rather of the higher grade—for our colleges and universities. The author is an experienced teacher in this and allied branches of science.

Edward Jessup of West Farms, Westchester Co., New York, and his Descendants. With an Introduction and an Appendix, the latter containing records of other American families of the name, with some additional memoranda. By Rev. Henry Griswold Jesup. Cambridge: Privately printed for the author by John Wilson & Son. 1887. Sq. 8vo, pp. 442.

In this very handsome volume will be found a good record of the comparatively small family descended from Edward Jessop, one of the early colonists of Stamford. As he had but one son and three grandsons of the name, it will be understood that bearers of the name have been few, and relationships have been readily traced. The author has kept the descendants in these three main lines the more easily because one grandson, Joseph, moved to New York, and his family, being Loyalists, removed to Canada.

Edward Jessop appears as one of the settlers at Stamford in 1649. An incidental mention occurs of his mother, the widow Whitmore, undoubtedly the relict of that John Whitmore, prominent in the settlement of Stamford, who was killed by the Indians in 1648. Jessop died in 1666, leaving a daughter Elizabeth, wife of Thomas Hunt, jr., and a grandchild, Mary Hunt, mentioned in his will; another daughter, Hannah, not eighteen; and a son Edward, born in 1663. He also left a widow Elizabeth, who married Robert Beacham or Beauchamp, and survived him, dying after 1690. It seems highly probable that Jessop had been twice married. In his will he mentions his brother-in-law, John Burroughs, and cousin Johannah B., evidently John's daughter.

We are quite disappointed at finding no proof of the English ancestry of the emigrant. It was well known that among the Puritans at Leyden was a Francis Jessop, who married there Frances White, probably a sister of the wife of the Rev. John Robinson. There was a John Jessop also at Stamford, who settled at Southampton, N. Y., in 1653, and left a numerous posterity. The above-named Francis was the third son of Richard J. of Broom Hall, in Sheffield, and it had been hoped that a connection would be traced from this main stock to the two emigrants to Connecticut. It appears, however, that the services of the late Col. Chester were engaged, but that his death prevented the completion of his search. It seems highly probable that a renewed investigation would be successful, as the indications are certainly encouraging. In the meantime, we congratulate the family upon the very satisfactory history of the race in America which has been prepared in this volume.

Subjective Political Economy. By Arthur M. Smith. 2d ed. London: Williams & Norgate.

The modest task which the author of this work sets before him is "to show that there is in reality no question at issue between the various schools of political economists." His method of doing this is calculated to amuse such readers as it fails to confuse. He sets out by making his own definitions of all the terms used in economic discussion, and then assumes towards each problem different "mental attitudes," which are not always either graceful or effective. For example, he will look at a question from the "egoistic" standpoint, and then from the "altruistic"; or from the "ideal" standpoint, and then from the "real"; or from the "standpoint of time," and then from the "standpoint of eternity." From this last standpoint he finds that Ricardo's theory of rent is true and logical, but from the standpoint of time he finds it false; for, he maintains, Ricardo ignores the element of time, and the real "cause of rent is the alteration in value consequent upon the consideration of time."

That alone which makes the book worthy of review is the fact that its author is an English protectionist. A protectionist writer always has a claim to a hearing, first, as a matter of fair play, and second, because he is almost certain to say something new and original. Free-traders have a few commonplace propositions upon which all are agreed. But the arguments for protection change with each decade, with each country, and with each thinker. Mr. Smith's form no exception to this rule. It is true that we have often heard the first of his two main arguments. It is that free trade (like machinery) enables the same amount of goods to be produced with less labor, and thus injures the laborer. But his second argument is unique, and it is here that he rests his case. The mistake of the free-traders, he maintains, is that they ignore the element of time. "Is he a wise man," he asks triumphantly, "who buys in the most distant market? . . . The answer is plain: he buys of his next-door neighbor at a higher price, in preference to a man at a greater distance, because the further off the person from whom he buys, the greater will be the amount he will have to pay in order to buy time." As one lays down the book, he involuntarily wonders whether Mr. Smith's belief in protection is the cause or the effect of the other ideas which he holds.

Claverhouse. By Mowbray Morris. [English Worthies.] D. Appleton & Co. 1887. 12mo, pp. 222.

It would have been thought somewhat strange, a few years ago, to class John Graham of Claverhouse among the "worthies," so evil are the associations with his name among the descendants of the Puritans. And even in the present tolerant days, when we recognize that no man is wholly bad, as no man is wholly good, it is hard to bestow this epithet upon a man whose chief merit, as an historical character, is that he did the duties that were laid upon him faithfully and efficiently, if with unnecessary violence and brutality. That he was in a sense an heroic character, all will readily admit; that his heroism was of the elevated type of that of

his contemporary, Blake, will not probably be claimed.

Mr. Morris's book is written with the thoroughness and the fairness which characterize the other books of the series, and indeed the modern English school of biography. It will not do the admirers of seventeenth-century Puritanism any harm to be made acquainted with the good side of this hated personage; while, on the other hand, the partisans of the Government will learn from it that the resistance of the Covenanters was justified, and even their excesses almost extenuated, by the grievances to which they were forced to submit. Of Claverhouse himself Mr. Morris says (p. 133):

"He was no capricious and unlicensed oppressor of a God-fearing and inoffensive peasantry, but a soldier waging war against a turbulent population carrying arms and willing to use them. . . . His most able and his bitterest accuser pronounces him to have been 'rapacious and profane, of violent temper, and obdurate heart.' Yet every attempt of his enemies to convict him of extortion or malversation broke signally down. The decorum of his life and conversation was allowed even by the Covenanters; and it is recorded as a notable thing that, however disturbed or thwarted, he was never known to use profane language. . . . His heart was indeed hard to those whom he regarded as plotters and murderers, traitors to their king, and enemies of the true religion. He was, indeed, in his own way as much a fanatic as the men whom he was empowered to crush. . . . But his hardness, if not tempered with mercy, was at least guided by more justice than was common among his colleagues. He both advocated and practised the policy of distinguishing between the multitude and their ringleaders. . . . When judged by the general manners of the age, the circumstances of the time, and his position, I do not believe him to have been cruel by nature or careless of human life."

In his youth he says of him (p. 47): "His manners were gentle and courteous, though reserved; his habit of life was, as has been said, singularly decorous; he was scrupulous in the observance of all religious ordinances."

When it comes to the special instances of brutality charged against Claverhouse, the case of the "Wigtown martyrs" is passed over briefly, for the reason that "Claverhouse was present neither at the trial nor the execution." That the story is a true one, and that "the two women were drowned in the waters of the Blednock on May 11, 1685, is surely a fact as well authenticated as any in the martyrology of the Scottish Covenant" (p. 114). But "that Claverhouse, and he alone, is responsible for the death of John Brown, stands on the very best authority, for it stands on his own." Even here, however, the worst features of the case are not certainly attested. Other cases are examined in the same candid spirit, including that of Andrew Hislop, "a far blacker case than the more notorious one of John Brown," because the victim was an innocent boy, whom Claverhouse wished to save and had the power to save, but, "like Pilate, he preferred his own convenience." One thing is clear: if we have here an apparent reversal of the judgment of history, the final verdict is, after all, not very different from that of Scott in 'Old Mortality.'

Free Rum on the Congo, and What It is Doing There. By Wm. T. Hornaday. Chicago: Woman's Temperance Publication Association. 1887. Pp. 145. 12mo.

THIS indictment of the Christian nations for their responsibility for the African liquor traffic is a just one. The simple facts are these: When the Berlin Conference in 1884 established the Congo Free State, four of the Powers, Great Britain, Italy, Belgium, and the United States, endeavored to secure a special article restricting the liquor traffic. This humane proposition was opposed by the representatives of France, Netherlands, and Germany, and, as a unanimous vote was required for the adoption of any measure, it was defeated. There are, therefore, no restrictions whatever to the importation of liquor, and this business has accordingly assumed enormous proportions. In one year five nations alone shipped 10,377,166 gallons to African ports; Germany being the leading offender with nearly 8,000,000, the Netherlands following with 1,099,146, and Boston coming third with 737,650 gallons. Bottles of gin have become the currency in place of yards of cloth, half the native produce and labor is paid in it, while an insatiable craving for it has been excited in the wretched tribes reached by the "Christian" trader. Naturally the stuff is of the vilest quality, though in this, it should be said, the Germans discriminate. When Herr Woermann, Deputy for Hamburg and head of the great house bearing his name, was charged in the Reichstag with sending poisonous brandy to Africa, he acknowledged that it was true. "He said, however, that he had never sent bad brandy to any of the German colonies, but to the French colonies. To these he had shipped rum of the worst quality." There is no need of following Mr. Hornaday in an attempt to show the incalculable and indescribable evil which this nefarious trade is doing. That must be evident to every thinking person. There is only one remedy, so far as we are concerned, and that is, to arouse a public sentiment against it so strong that the Powers represented at the Berlin Conference shall meet again and pass a measure prohibiting the shipment of liquor to African ports. This is not hopeless, since six of these Powers, including the three original opponents of restriction, have recently signed a convention prohibiting the sale of liquor by the "copers" (floating grog-shops) to the North Sea fishing fleets. The only other hope for Africa is that Mohammedanism, victorious over both Christianity and fetishism, shall at the same time extirpate intemperance. We have but a single word of criticism for Mr. Hornaday's earnest book, and that is, it is too long.

BOOKS OF THE WEEK.

Andrews, Dr. I. W. Manual of the Constitution of the United States. Revised edition. Van Antwerp, Bragg & Co.

Periodicals and volumes of moderate compass can be mailed direct from their London office to the address of American customers. Information in regard to books and prices will be promptly given.

The Nation.

NEW YORK, THURSDAY, JANUARY 19, 1888.

The Week.

THE campaign against Mr. Lamar was foredoomed to failure. The Republicans in the Senate have a majority only by the vote of a "rebel" from Virginia, and self-respect of course demanded that Mr. Riddleberger should vote for confirmation. It was morally certain that other Republican Senators would join him. So the event proved. Mr. Stewart of Nevada and Mr. Stanford of California voted on Monday for confirmation, and the *Tribune's* despatch says that "other Republican votes could have been obtained" on the same side if they had been necessary. The net result of the incident, therefore, is simply to expose the Republican party under its present management as a sectional and unbalanced organization, which challenges the opposition of right-minded men.

Now that the *Tribune's* great Congress of "representatives of various branches of agricultural production" has adjourned, it will be interesting to peruse the following "call" which was sent out by the *Tribune* as a reason for bringing them together, several copies of which have been sent to us by recipients who did not care to respond:

"I ask your attention to a special agitation in behalf of protection now being carried on by the *Tribune*. The *Tribune* has sent letters to all the granges, clubs, and agricultural societies in the United States—over 6,000 in number, with a membership of over 1,000,000—asking them to debate the question of protection, and report their views to this office. Large farmers have been asked to report their individual opinions. This agitation has been in progress somewhat more than a year. A genuine interest in the tariff has been awakened by this discussion among farmers, and the protection sentiment, existing among them to some extent, has been greatly strengthened already, and grows in strength every week. A large number of debates have been had in granges and societies, and a great mass of replies have been received by the *Tribune*. The *Tribune* now proposes to submit these replies to a competent committee of representatives of the various branches of agricultural production, over which the Hon. Warner Miller, ex-United States Senator, has consented to preside, and to have prepared an emphatic statement to the country of the wants of the farmers of America, and the need of better protection to their products. The Committee will meet in New York in January. Their statement will be promptly published and submitted to all the granges and societies for their approval, with a view to its final presentation to Congress as an expression of the sentiments of the farmers of America."

There is more of the "call," including the disinterested information that the "subscription price of the *Semi-Weekly Tribune* is $2 a year"; but we have given the more important portions of it. The net result of the "genuine interest" awakened among the farmers which had been "strengthened" and "grew in strength" for "somewhat more than a year," was the assembling of an august body of seven men, none of whom were farmers, or in any sense representative of any kind of "agricultural production," unless exception be made in favor of Col. William M. Grosvenor, of Englewood and the *Tribune's* editorial staff, who is a great "producer" of "chastity" and similar articles. Over this body the Hon. Warner Miller, ex-United States Senator, did preside for two days and two evenings. It is interesting to have the "call's" assurance that the results will be promptly embodied in "an emphatic statement to the country of the wants of the Farmers of America," with a "view to its final presentation to Congress as an expression of the sentiments of the Farmers of America." That will be one of the greatest jokes ever perpetrated by the *Tribune*, and will burst upon Congress like a thunderclap. But for drollery it cannot beat Col. Grosvenor's appearance at "the Congress" as an essayist on the "Hemp and Flax Industries," he having been the author of that very effective attack on the tariff entitled 'Does Protection Protect?' and in 1872 the Secretary of the Free-Trade League in this city and Washington.

The proceedings of the Subsidy Convention at Washington on Monday were opened by prayer by the Rev. Dr. Leonard, who implored the Divine guidance in measures for the development of American shipping. Taste in prayer is not a proper subject for newspaper criticism, and it must be said for the Rev. Dr. Leonard that if he consented to pray at a business convention at all, he was bound to remember business in his supplications. What impresses us most is the fine opportunity that the reduction of the surplus affords for variety in prayer at the national capital. The wool men had a convention the other day. It must strike them now as a great oversight that they did not have their proceedings each day opened with prayer. There might have been a prayer one day for carpet-wool and another day for clothing-wool, and another for worsteds, and so on. Presently we shall have conventions representing other interests threatened by the condition of the surplus. Prayer for or against tobacco, sugar, salt, lumber, pearl buttons, etc., etc., would afford a fine field for the display of talent among the clergy of Washington city.

The ancient farce of a joint meeting of wool-growers and woollen manufacturers was reënacted last week at Washington. The interests of the two are diametrically opposed. The woollen manufacturers want free wool or extremely low duties. The wool-growers want the highest possible duties, but they would like prohibition of foreign wool better than anything else. Each class is afraid of the other, and now for the first time both are afraid of the people of the United States as consumers of woollen goods. Their efforts to secure apparent harmony are thus more complicated and embarrassing than usual. The wool-growers have put forward a demand for higher duties on carpet wool. This, it is said, the manufacturers will not agree to. If they do agree to it, they will forfeit every claim to consideration and respectful treatment by tariff reformers. Carpet wools are not produced in this country. Therefore the tariff on such wool violates the principles of protection as much as those of free trade. It is kept in force solely for the sake of example—a bad example. The idea which lies at the bottom of this pernicious and unnecessary duty is that "wool is wool, and if you admit one kind free of duty, even though it is not produced here, you weaken the argument for duties on all the other kinds." The carpet-makers are asked to pay several million dollars per year in taxes that the Government does not want, in order to nurse this sentimental nonsense. We tell the carpet men plainly that the tariff reformers are better friends of theirs than the wool-growers, and can be relied on with much more confidence to deal justly by them through thick and thin.

The question of officers for the National Republican Committee in the approaching Presidential campaign is agitating the minds of the Republican leaders, and we are not surprised to see the current of opinion running strongly in favor of such men as "Tom" Cooper, "Chris" Magee and "Matt" Quay of Pennsylvania, "Bill" Chandler, and "Tom" Platt. The latter is looked upon as the inevitable man for Chairman of the Executive Committee, and Chandler appears to be slightly in the lead for Chairman of the National Committee. It would be difficult to fix upon two men more representative of the tendencies of the party at this time, for in all the country there are not to be found two men more expert in political "tricks" and "dodges." Still, if the battle-cry of the campaign is to be "Blaine and a surplus," there ought to be a good sprinkling of Pennsylvania talent in the Committee, for, as the Chicago *Tribune* has well said of Blaine's tariff views, they are "Pennsylvanian" in origin, and have little popular strength anywhere else.

Mr. Henry Cabot Lodge says that the Massachusetts Republicans are for Mr. Blaine's nomination, and that "Mr. Blaine's candidacy will inspire greater enthusiasm than that of any other Republican." It was their failure to "inspire enthusiasm," we suppose, which caused Republican candidates like Lincoln, Grant, Hayes, and Garfield to make such a contemptible showing beside Blaine as they do in this table, which gives the Republican vote, the total opposition vote, and the Republican majority over all opposition in Massachusetts at every election from 1860 to 1884:

	Rep. Vote.	Opposition.	Rep. Maj.
Lincoln, 1860	106,533	62,642	43,891
Lincoln, 1864	126,742	48,745	77,997
Grant, 1868	136,477	59,408	77,069
Grant, 1872	133,472	59,260	74,212
Hayes, 1876	150,063	109,556	40,507
Garfield, 1880	165,205	117,307	47,898
Blaine, 1884	146,724	156,657	?

If the author of "the Paris message," who supposes that people pay in gold and silver for foreign goods, had consulted Benjamin Franklin's examination before a committee of the House of Commons in 1766 touching the Stamp Act, he would have found a very neat exposition of the way in which accounts are settled in international trade, and perhaps have been saved from telling that story of his about the effect of the tariff of 1846 on our supply of specie. Franklin had informed the Committee that Pennsylvania imported annually from Great Britain about £500,000 worth of goods, and only exported to Great Britain about £40,000 worth of the produce of the province. "How, then," he was asked, "do you pay the balance?"

"Ans. The balance is paid by our produce carried to the West Indies, and sold on our own islands, or to the French, Spanish, Danes, and Dutch; by the same produce carried to other colonies in North America, as to New England, Nova Scotia, Newfoundland, Carolina, and Georgia; by the same carried to different parts of Europe, as Spain, Portugal, and Italy. In all such places we receive either money, bills of exchange, or commodities that suit for remittance to Britain, which, together with all the profits in the industry of our merchants and mariners arising in those circuitous voyages, and the freights made by their ships, centre finally in Britain to discharge the balance, and pay for British manufactures continually used in the provinces or sold to foreigners by our traders."

There could hardly be a clearer lesson in the working of foreign exchange. It was given by an American 120 years ago, and yet the Republican candidate for the Presidency, although nearly sixty years old, has not yet mastered it.

What farmers who really farm think about the high tariff, is shown by the memorial to Congress adopted by the Nebraska State Farmers' Alliance at its annual session a few days ago. These Nebraska farmers represent that agriculture is greatly depressed, and name among the prominent causes for this depression "the protective-tariff system as it now prevails, taxing the farmers of the nation to aggrandize the manufacturers, upon the plea of protecting American labor, while labor is left free to come to this country from all parts of the world." The memorialists represent that only a small proportion of the tax imposed upon the people by the protective tariff goes into the Treasury, "but through an enhancement of prices swells the profits of the manufacturers, who, by virtue of our natural advantages, ought to be able to compete with the world on equal terms"; and they point out that our agricultural products are sold in the open markets of the world in competition with the world, while the manufacturer, through the tariff, receives a bonus of from 25 to 100 per cent. on his goods." While not favoring free trade, they do favor the extension of the free list, and the levying of duties more upon articles of luxury, the conclusion of this vigorous document being as follows: "Your memorialists would therefore most earnestly protest against the removal of taxes from whiskey and tobacco, and as earnestly pray for relief from taxation upon iron, coal, salt, lumber, wool, woollen goods, and sugar." The President addressed his message largely to the farmers, and their response is very hearty.

The account given by Prof. R. W. Raymond of the origin and progress of the strike in the Lehigh and Schuylkill coal districts will suggest to thoughtful readers that the coal companies owe to the public the duty of putting new men at work if the old ones decline to resume their places. The impression has gone abroad that the wages paid to the miners were so desperately low that a strike was, upon a broad view, justifiable, if not necessary. Prof. Raymond shows that this is an entire mistake. The miners, good, bad, and indifferent, in the Lehigh district when the strike began, were getting an average of $2.72 per day. Taking account of the occasional suspensions of work, they were earning $660 per year average. These are far from starvation rates, as every laboring man knows. Nobody questions the miner's right to strike. It is his duty to improve his condition, and it may be his duty to cease production in order to determine whether the coal market and the labor market, and all other markets which make up human society, will enable him to exact $3 per day for work that he had been doing for $2.72 heretofore. But in exercising this right he must regard other people's rights, including the right of society to get its coal as cheaply as it can be afforded. A curious notion has got into the heads of some people that, although a railroad company may, and indeed must, keep its trains running, and to this end must fill the places of striking employees without delay, yet a coal company under like circumstances must wait until the community are in dire distress, the poorer classes pretty well frozen, and a large number of workingmen in factories and furnaces thrown out of employment for want of fuel, before making any attempt to fill the places of the strikers. In other words, society has been so befooled by the talk of starvation wages in the coal mines that more than half the people who think about the matter at all conclude that the miners have a right to stand at the mouth of the pits and to stone and club everybody who wants to go down to dig coal. This grotesque conception will probably hold the public mind until the scarcity of coal causes considerable suffering. Then it will be perceived that the sixty millions of American people—for there are very few who do not use anthracite or depend upon it in some way—have rights also which it is expedient to enforce, and that among these is the right to pay not exceeding $2.72 per day for coal-mining, if men can be found who are willing to work at that rate.

The Reverend Pentecost opened his Anti-Poverty Church in Masonic Temple on Sunday morning, and Henry George was present to see how it worked. It was announced at the start that the services would be held every Sunday morning as long as the amount of the collections warranted their continuance. This, as we understand it, is the fundamental doctrine of the anti-poverty creed—namely, a good collection. No poverty can be abolished without that. Mr. Pentecost, in order, probably, not to cut off the collection at the Academy in the evening, will call his society the "Unity Congregation." He said that he did not propose "to make Christians, but good men," and that "agnostics, atheists, infidels, Jews, Protestants, Catholics, all," were welcome to come and submit themselves to the process. On Sunday the work was helped forward by an organ and a cornet, and the preacher declared that he was convinced that neither the Christian Church nor the country lived up to the "doctrine of the brotherhood of man," that the relations of capital and labor, the class distinctions between the rich and the poor, and the condition of the universe generally, "were all wrong, and this pulpit would so preach." It is to be hoped that the collections will continue large, for the Rev. Pentecost has no less a task on hand than the reformation of the world, and it would be a pity to have that fail through lack of funds.

Collector Magone, having been misled by suppression or misrepresentation of facts to appoint a horse-race gambler to an important position in the Custom-house, has, after being made better acquainted with the man's antecedents, suspended him for further investigation. This action, so unusual in a high public officer, calls for special commendation—more, we think, than a refusal to appoint such a man in the first instance. It has become almost an axiom in politics that if you have made a mistake in the appointment of a bad character to a public place, you ought never to acknowledge it, but rather brazen it out, because by and by the public will find something else to talk about, and thus your infallibility will not receive the shock implied by reversing your own action. Collector Magone takes a different view, holding, apparently, that if he has been deceived, he is himself the principal sufferer, and that the best way to vindicate his powers of judgment is to correct his mistakes as soon as he discovers them. No great talent is required in dealing with dilemmas of this kind, but it is strange that so few people possess it.

The Commission to "investigate and report the most humane and practicable method of carrying into effect the sentence of death in capital cases" in this State have made their report to the Legislature. It is much to be regretted that there should be so much extraneous matter in it. One whole page is given to a list of capital offences under the Mosaic code. Forty-four pages out of a total of one hundred are devoted to minute and revolting descriptions of the various modes of inflicting the punishment of death resorted to by different nations, civilized and barbarous, in various ages. The report ends by recommending the substitution of electricity for hanging as a means of inflicting the punishment of death, both as more certain and more humane, and as more easily used without miscarriage. The observations of the Commissioners on the scandals resulting from the

delivery of the bodies of criminals after execution to their friends for interment, will meet with a hearty response from the public, at least in this city. The "wakes" and triumphant funerals to which the remains of murdering scoundrels have often, after hanging, been treated by their criminal friends and acquaintances in New York, have done much to deprive the death penalty of its horrors among the class for whose benefit it is specially intended. In New Jersey a statute exacts a bond from the persons applying for the body of an executed criminal, conditioned on their refraining from any public funeral, and makes violation of the act a misdemeanor. The Commission recommend that in this State the bodies of all such criminals be given to the medical profession for dissection, and be then buried under quicklime in the prison cemetery or graveyard. This is the practice, we believe, of all other civilized peoples, and it is a wholesome one.

The California sugar-refiners and Sandwich Island planters, who have been enjoying a very artificial monopoly for many years at the expense of the United States Government—their sugar being admitted duty free, while all other raw sugars are taxed nearly or quite 100 per cent.—are greatly disturbed by the rumor that the Eastern sugar-refiners have consented to a reduction of one-half of the sugar duties. The California brethren have assumed that the Eastern refiners have consented only to the reduction on raw sugars, intending that sugar shall not be made any cheaper to consumers, but only to themselves. We are not in the confidence of the "Sugar Trust," but we are well convinced that they do not expect any such absurd arrangement as a reduction of the duty on raw sugar without an equal reduction on refined, because in the first place they could not get it, and in the second place they consider themselves able to compete on equal terms with anybody in the world in their line of business. What they chiefly object to is the bonus allowed to California refiners under the Hawaiian Treaty, by means of which sugars which have paid no tax are sent East to compete with the duty-paid article.

The European sugar bounties are in a fair way towards extinction. The London Conference, embracing representatives of all the beet-growing countries, put the seal of condemnation on the bounty system by unanimous vote. There are, indeed, some difficulties of detail to be overcome, and some time must elapse in order to close out existing contracts before the bounties can be wholly abolished; but the spirit in which the Conference acted leaves little doubt that the end of the system draws near. The delegates to the Conference are to meet again in London on the 5th of April, furnished with the latest instructions of their governments. The difficulties of detail will then be settled and a time fixed for stopping the bounties. It was agreed that sugar for export should be manufactured in bond so far as practicable, and that where this was not practicable, the drawback on exportation should be made exactly equal to the import or excise duty. After the reform is once effected, the whole world will wonder how it could ever have happened that a civilized country should offer a cash premium in order to rid itself of one of the most valuable products of human skill and the earth's fertility. A more grotesque conceit never entered into the skull of man.

Experiments made with fiat money in the republic of Peru are having a disastrous termination, but the action of the Government in the matter is open to grave doubt. When a government has stolen the real money of its subjects and filled their pockets with irredeemable paper, and when, in the course of time, the butcher, the baker and candlestick-maker refuse to sell their wares and merchandise for that kind of funds, the obviously proper course to pursue is to arrest those disloyal persons and appoint proper officers to sell their goods for them, taking in payment the lawful money of the country. If it is objected that after the stock in hand is thus sold no more will come in from the country, then let the soldiers go into the country and serve the farmers the same way. Instead of pursuing a course so well calculated to inspire confidence in the strength of the Government, we read that when the inhabitants of Lima wanted to mob the provision dealers, the police interfered and would not allow them to do so. They even fired on the people, and wounded several boys who were taking part in the proceedings for fun. The most indefensible act, however, was the protection extended by the Government to the money-changers. These scoundrels abound in all fiat-money countries, and they are the more numerous in proportion to the badness of the money. Consequently Lima is alive with them. What is more natural than the inference that they have connived with the butcher, the baker and candlestickmaker to refuse to sell their goods, in order to force a still heavier premium on the precious metals? Yet when the people "went for" the money-changers the police drove them off. But the miscreants became alarmed and fled from the town, so that "on December 10 there was not a single money-changer or business house in Lima selling silver soles for paper money." The people then tried to do business on half soles—that is, by tearing their paper soles in two—but this didn't work. At the latest advices all the banks were closed, the retail stores were closing, and a revolution was impending.

The English advertisements for 1887 of "Next of Kin Wanted," and persons who might "learn something greatly to their advantage," are less dramatic than sometimes happens, but yet are of varied nature and not without peculiar interest for some persons in this country. Jacob Herbert, "last heard of in Pennsylvania," will lose something handsome if he does not soon "materialize," and so will William Barnes, "last heard of in Chicago," and Albert and Alice Morris, who were taken to Canada and adopted by separate families. The heirs-at-law of Henry Blizzard should, of course, be looked for in Manitoba or Montana. Unless Joseph Prunty, a shopkeeper, who left Ireland for America in 1880, makes himself known within a given date, letters of administration will be granted to his next-of-kin as if he had died intestate. Near New York, perhaps, may be found persons sought who are "interested in unclaimed dividends of the West New Jersey Society (1692-3)." Lapse of time seems little to affect the ardor of search in the slow-going Old-World country, the Bank of England having issued many advertisements respecting the retransfer of unclaimed dividends (claimants having appeared), including three cases in which the dividends had remained unclaimed since 1763, 1797, and 1798. Persons claiming to be entitled to a fund standing in the name of Anna Sheppard, who is believed to have died in 1741, are only now invoked. The Treasury Solicitor sought the next-of-kin in some forty "Crown windfall" cases, the owners of these estates having died intestate without known heirs. It may be here noted that, by the recent decision of Mr. Justice Chitty in the Heathcote case, the Crown comes into a "windfall" of £200,000 by reason of the death of a lunatic in 1884 without known next-of-kin. A very considerable sum accrues annually to the Crown from this source, but it is only after extreme efforts to discover next-of-kin all over the world, more especially in the widespread remote British possessions. Some curious cases arose out of the Presumption of Life Limitation (Scotland) Act, under which relatives sought to "uplift and enjoy" the estates of persons who, having failed to report themselves for periods of seven years or upwards, were supposed to be dead.

Lord Salisbury's blunt announcement at Liverpool that inasmuch as it is the Liberal Unionists who keep the Tories in office, the Tories must do what the Liberal Unionists please, seems to be taken to mean that the County Government Bill, whenever it comes, will be thoroughly democratic, and will hand the counties over completely to representative assemblies. As this would finally oust the landholders from influence and authority which they have enjoyed ever since England became a nation, it might be considered the most important proposal ever made by an English Minister. If the way for it had not been prepared by the extension of the suffrage and the ballot, it would probably startle the Conservatives even more than it does. It will be very interesting to see whether they care enough about Ireland to be willing to make this prodigious and final sacrifice for the purpose of holding her in subjection, because this democratization of the counties is the price they are paying for "the unity of the empire" and the discomfiture of Gladstone. If they were rid of the Irish, and Gladstone were no longer formidable, they would be able to make a tolerably good fight in the English constituencies on English questions.

THE EFFECT OF THE MESSAGE.

THE boldness and novelty of the President's message naturally created more or less uncertainty, both as to its effects on public opinion and on his own political fortunes. It was expected that it would be long, but it turned out to be almost unprecedentedly short. It was expected to deal lightly with a great number of topics, but it dealt with only one, and this thoroughly. It was expected that it would avoid all burning questions, so as not to imperil his renomination, which seemed to be assured by the New York election, but it took up the most burning question of the day, and treated it with utter disregard of its possible effects on the canvass of 1888. It is not surprising that a performance of this sort should have puzzled a great many people, and especially the veterans of political management, to whom it seemed simple foolishness, the spoiling of a magnificent situation. Their sensations were very like honest old Wurmser's in Italy when he was assailed by the young Napoleon in a manner which violated all the rules of the art as taught down to that day. Wurmser had a long line, manned by three excellent divisions, and he expected Napoleon to attack him along the whole line with three divisions also. Instead of this, Napoleon took his three divisions all together, and with them attacked Wurmser's, not all together, but one by one, which Wurmser considered both unfair and reprehensible, but it entirely answered Napoleon's purpose.

All Presidential messages which have been sent to Congress since the war have fallen perfectly flat, except this last one, and yet they were all composed according to usage, both as regards matter and manner. They were of great length and touched on everything, but threw no new light on anything, and were forgotten almost as soon as read. To President Cleveland belongs the honor of having for the first time since Lincoln produced a message which is, in the highest and best sense of the term, a state paper—that is, a paper which sets people thinking, which affects opinion, and which extracts from the mass of issues the really vital and pressing question of the day, the only one which can be neither ignored, nor postponed, nor made light of.

It has now been six weeks before the country, and we have ample means of determining what its effects have been. The first and most plainly observable of these effects is that it has raised the President's character in the estimation of both friends and foes. Those who most severely condemned the message from the party point of view acknowledge that it shows courage and disinterestedness. In other words, in writing it the President has given the strongest evidence he could possibly give, that he is a man of sincere convictions, and that he would rather be right than be President. Other men before him have said this, but he is the only man who has demonstrated it even in the eyes of his enemies or detractors. In other words, every one who calls him a fool on account of it pays the highest possible tribute to his character. In no way could he so well dispose of the conclusions about him, drawn of late from his apparent lapses from virtue in the matter of civil-service reform, as by unnecessarily putting in peril his chances of renomination, and this is what some of the shrewd politicians thought a month ago that he had done.

We for our part have all along felt assured that his folly in this matter was really the highest wisdom—not the wisdom which comes from calculation, but from sudden inspiration. For courage is, after all, the quality which most readily touches the popular imagination in men put in high places by the popular vote. People pardon a great deal of planning and contriving and giving and taking in a man who is striving for the Presidency; but when he is in the office, the proof of fitness they most appreciate is readiness to put his foot down, to say the right thing at the right time, or even the right thing at the wrong time, without regard to consequences. If the history of the American Presidency teaches anything clearly, it is that the way of the wavering, vacillating, timid man is even harder than that of the bold sinner.

But this is by no means all. The message has also had the extraordinary fortune of receiving an amount of commendation and acceptance from men of the opposite political party, which has fallen to the lot of no similar document since Lincoln appealed to Americans of every party to save the Union. We could easily give the most abundant proofs of this culled from Republican newspapers in all parts of the country. We presume there is not one of our readers who cannot produce similar testimony from his own experience. Tens of thousands of those who did not vote for Cleveland in 1884, and have never since been quite willing to avow that they had made a mistake, have been convinced by the message that he is the man for the times.

Not less significant is the gradual cessation of even the very feeble murmurs which at first came from the Protectionist portion of the Democratic press. Day by day their protests have been becoming feebler, and the arguments in favor of the maintenance of a surplus for politicians to "handle," more and more absurd. There is now an almost general agreement that a surplus must not form a permanent feature of American finance, and the most spiteful enemies of the President find no refuge except in the statement that "if the surplus has to be abolished, it sha'n't be done in Cleveland's way." We do not believe, however, that any rejection of his suggestions as to means will sensibly diminish the impression produced by the manner in which he has called attention to the end. No matter how the evil is cured, he will get the credit of having laid it bare in such a way that every man, woman, and child in the country could see and understand it and measure it. He has, in other words, no matter how the taxes may now be reduced, taught the nation, with a master hand, a lesson in finance which will be constantly recalled in the efforts to keep down the public burdens that will henceforth have to be made every year until we get down to the bed-rock of all politics—that people should pay into the public Treasury only the sums necessary to "establish justice, insure domestic tranquillity, provide for the common defence, and promote the general welfare."

THE INTERNATIONAL COPYRIGHT BILL.

THE bill which has been presented to the Senate by Mr. Chace, but which it is an open secret was drawn up by a well-known Philadelphia publisher, may be briefly described to be a bill amending that portion of the Revised Statutes of the United States which acknowledges an author's or artist's equitable claim to the fruits of his mental labor, and grants a certain legal protection therefor—in such wise that this protection is secured not only to authors or artists who are citizens of the United States, but to mental workers the world over. The United States has been, for many years, perhaps the only civilized country which has failed to recognize the claims of the author to a reward for his labor without regard to his individual nationality. To our eternal national disgrace, it must be frankly admitted that this delay in granting an act of simple justice has been entirely due to the fact that honest legislation would affect the purses of American citizens. And the tardy measure of justice which our Congress is now called upon to consider is impaired by two regrettable limitations of the very right which it is the purport of the proposed act to establish and grant. It is admitted that when legislatures accord legal protection to what has been acknowledged as the moral right of any class, they may limit the exercise of such right, by virtue of considerations affecting the general good of the whole people. And all States, with a single noticeable exception, have abridged the property rights of authors, by according legal protection to such rights for a limited period of time. In no case, however, is legislation justified which attempts to restrain the exercise of the universally admitted right of any one class for the benefit of any other class, but only when such limitation is beneficial to the whole people.

According to Senate bill 554, the rights secured to the American author by the Domestic Copyright Law are abridged when the law is extended to include the foreign author—firstly, by refusing to permit the latter to manufacture his book wherever he pleases; and, secondly, by further refusing to permit him to supply whatever demand there may be in this country for copies of his authorized foreign edition. Stipulations of this nature have never hampered the international copyright legislation of European States. As contributors to the American press, with a regrettable lack of ingenuousness, have striven to give the impression that the American author is obliged by law to print and publish his work in the United States, it may be briefly but emphatically stated that the Copyright Law of the United States in no wise prevents an author who is a

citizen of this country from printing his book abroad, binding it abroad, or writing it abroad—anywhere in the wide world that he may choose; and not once but many times has this occurred, notable examples being the later novels of Mr. Henry James and Mr. Marion Crawford.

The instigators of these curtailments of the foreign author's rights defend the first upon the ground that compulsory printing in this country is necessary to secure books of sufficient cheapness to be beneficial, by their great circulation, to the people at large; and that the good secured to the masses through cheap books justifies the limitation put upon the right of the comparatively few authors. But the honesty of this defence may be doubted so long as the second prohibition remains, because even the dullest intellect can perceive that if, as is claimed, compulsory printing in this country is necessary in order to prevent English publishers from forcing upon American readers high-priced English editions, a prohibition of import can only be added because of a fear that the English copyright owner *may* choose to send into this country an authorized edition which could be sold to American readers at a smaller price than the enforced American reprint. But is not a book printed in England at a lower price of equal benefit "to the masses" with the same book printed in this country at a higher price?

We have before insisted that there is no precedent in the foreign copyright laws for such prohibition of importation as is contemplated in this bill. But to return to this point again, it may be well to indicate briefly just what is stipulated in the copyright legislation of countries which present a problem similar to our own, by reason of both countries having one language. We could hardly desire a more suitable instance than that of France and Belgium. The latest copyright treaty between these countries went into effect May 16, 1882. This convention consists of seventeen articles, of which two relate to the importation into either of the countries of copies of works upon which there is copyright in one or the other of them. Section 9 prohibits the importation, exportation, circulation, or sale in each of the two countries of *unauthorized* reproductions, whether such unauthorized reprints proceed from either of the two countries or from any foreign country. This stipulation naturally occurs in all copyright treaties as well as in all domestic copyright laws. The American author by our own law enjoys the protection of a similar prohibition of unauthorized reprints, whether the latter are made and sold in the United States or are printed in Canada or elsewhere and imported into our territory. In section 3 it is further stipulated that the Belgian and French Governments shall take the necessary measures to prohibit the entry into their respective territories of works which the Belgian or French publishers may have acquired the right to reprint, with the reservation that such republications shall not be authorized to be sold in the country of their origin. For example, a French author sells to a Brussels publisher the right to print an edition of his book for Belgium, but with the stipulation that this edition shall not be sent into France to compete with the original French issue. The second paragraph of the article requires that each copy of such Belgian edition must bear upon its title-page and cover the words: "Edition prohibited in France, but authorized for Belgium and abroad." In like manner, if there should be a copyright treaty between England and the United States, we should naturally expect that it would be stipulated that the American reprint, for example, of Matthew Arnold's poems should not be allowed to be imported into England to compete there with the English copyright edition; and in the same way the American publisher of Henry James's novels would need to be protected against the possible flooding of this market with the cheaper English edition, copyrighted there under treaty arrangements. There is nothing in this convention between France and Belgium to hinder in any way the competing sale in either of the two countries of the edition of a work first published by authority of the author in any one of them. Nor does the Belgian copyright law of March 22, 1886, contain any enactment whatever which circumscribes the distribution of a foreign author's original edition.

The position of Canada towards England, as regards the question of protecting the English author in the former country, presents a parallel to the problem which Senate bill 554 attempts to solve. But although the Canadian Copyright Law, which was revised and consolidated in 1886, is intended to encourage the republishing in that country of the works of English authors, and grants a Canadian copyright upon all books so reprinted, care is taken in section 6 of the above act to explain that "nothing in this act shall be held to prohibit the importation from the United Kingdom of copies of any such work lawfully printed there."

THE SUGAR-BOUNTY CONFERENCE.

THE system of granting bounties upon exports at the same time that duties are imposed upon imports is one that appeals with irresistible logic to the protectionist intellect. There is something so beautifully symmetrical about it. The duty upon imports pays Paul by taxing Peter and the other ten. The bounty upon exports "evens things up" by taxing Paul and the other ten in order to pay Peter. The duty upon imports makes the balance of trade in a nation's favor by reducing importations. The bounty upon exports doubles this balance by increasing exportations. The duty gives employment to labor by shutting out foreign products; the bounty accomplishes the same great end by sending out native products. The duty raises the price of one class of products, the bounty raises the price of another; and the two classes of industries thus stimulated furnish a home market, which supports the remainder of the country in ease and affluence. In short, the two systems working together attain the high ideal of shutting out all possible goods, sending out all possible goods, and keeping what remains at the highest possible price.

Yet, in spite of these obvious advantages, the European Conference just held on the question of the sugar bounties has ended in a unanimous condemnation of the system. Every one of the sugar-producing nations was represented—Germany, Austria, France, Sweden, Denmark, Holland, Belgium, Spain, and Italy. With the exception of little Belgium, all agreed upon the plan of manufacturing sugar in bond, in order to prevent the possibility that rebates to exporters should serve as a cloak for further bounties. As Belgium is as anxious as the rest to be rid of the bounty system, she will probably, says the London *Spectator*, accept the method approved by the rest. There seems to be little doubt that all the legislatures will ratify the agreement of their representatives, and thus suddenly bring to an end a system which has been steadily growing for almost a century.

Ever since the Napoleonic wars the beet-root sugar industries have had every possible favor shown them by all the fiscal bureaus of Continental Europe. It was during the Napoleonic wars that these industries took their start. For a number of years the wars themselves furnished the necessary protection, but when peace finally brought with it the ever-attending calamity of low prices, the people were kept from suffering the injurious effects by the imposition of heavy duties. Inasmuch as the land on which the beet-root was grown, and many of the factories at which it was refined, were owned by the country gentlemen who everywhere controlled the legislatures, the new industry had no difficulty in obtaining the protection it desired.

But by and by the protective duties were insufficient to satisfy the demands of the sugar interest, and Government aid was asked that foreign markets might be invaded. At first this demand was made modestly. The interest consented to have taxes imposed upon the beet-root—so much per ton—and asked that a compensating rebate should be given them on the sugar exported. Of course nothing could be fairer. The request was at once granted, and the same thing happened as occurred in our own country when, during the civil war, the internal-revenue taxes were first levied. The question arose, How large a rebate is necessary to compensate for the new taxes on the raw materials? To determine this required expert testimony, and only those who were interested in the case were deemed competent to act as jurors to decide it. Practical sugar men were left to settle the question. The governments, of course, maintained their time-honored reputation for generosity, and refrained from haggling over the terms proposed.

But soon a new complication arose. The sugar men of one nation began to plead that their competitors in some other nation were more highly favored than themselves. This led to competitive generosity on the part of the governments. Meanwhile, the process of manufacturing had undergone great changes. It became possible to extract double as much sugar as formerly from the same quantity of beet-root. The rebates were not lowered, and all these influences act-

ing together finally brought matters to such a crisis that in Austria the Government has been paying out a larger sum upon the sugar exported than it collects from the entire sugar taxes.

For several years various governments have evinced signs of restlessness. Not only were the fiscal results of the bounty system lamentably unsatisfactory, but it was found that instead of protecting a home industry at the expense of foreign laborers, the bounties had resulted in protecting foreign laborers from the expense of paying for their sugar the actual cost of its production. The competition among the refiners compelled them to share their bounties with their customers. Their own people were compelled to pay prices abnormally high, in order that foreigners might buy at prices abnormally low.

This state of affairs staggered even the protection intellects which have charge of the financial systems of the Continent. They wished themselves well rid of the spoiled child whose whims they had so long been gratifying. But a reversal of policy was not easily to be brought about. The country which abolished the bounty system first must expect to find its exporters underbid by their competitors. The subsidized interests were too strong to be treated in this way. Accordingly, Germany, Austria, and France found themselves dependent upon the fiscal policies of Belgium and Spain. Nothing could be done until universal agreement should be reached as to what must be done. The fact that such an agreement has now been reached is conclusive evidence how intense and universal was the conviction that the long-continued bounty system had proved a complete failure.

BALLOT REFORM.

THERE is evidently going to be no lack of plans for reforming our ballot laws before the Legislature this winter. At least three are in sight now. Mr. Saxton, Chairman of the Assembly Judiciary Committee, is known to have been at work upon one for several weeks past, and a committee of experts in this city have been at work upon another since early in November last. In the Assembly, on Friday, Mr. Hamilton presented still another, which is said to have been drawn by Mr. Elihu Root, who did the work in accordance with a resolution adopted by the Union League Club a short time ago. The latter is the first to appear in the form of a bill, and we presume the intention of its sponsor, Mr. Hamilton, is to have it wait in the Committee until the other plans appear in bill form, in order that there may be made from them a composite measure which shall embody the wisdom of the three. This ought to be a comparatively easy matter, since the three will all be based upon the general principles of the English and Australian laws, which have been so successful in practice.

The bill introduced by Mr. Hamilton has evidently been drawn somewhat hastily, and we presume that it is introduced thus early in order to get a high place for it on the calendar, its authors expecting to have it amended and strengthened in Committee. It provides for the printing and distributing of ballots at the public expense, and authorizes the appointment of two ballot clerks of different political faith to attend to the additional work thus provided at each polling-place. The polling-places are to be enlarged, and furnished with a compartment to which voters may retire to select their ballots. Two weeks before election day, petitions to print ballots are to be handed to the officials charged with the conduct of elections. These petitions are to be signed in writing, and may come from county committees of each political party that cast one-tenth of the votes polled at the last election, in which case they must be signed by the Chairman and Secretary of the Committee. Petitions may come also from one per cent. of the voters themselves, in which case all the signatures of such voters must be appended and verified in the same manner as signatures to a deed are. Every petition must be accompanied by a deposit of five dollars for every thousand votes cast by the political organization filing it. The money so received is to be used to aid in defraying the expense of printing, the county paying the deficiency in case the petition money is inadequate.

The ballots are to be printed in books, each ballot having its own stub, and to be numbered consecutively. Each set of petitions is to be entitled to books for its own ticket, bearing its party name or title, the same not to exceed two words. A full set of ticket-books is to be provided at each polling-place before the polls are opened. When a voter comes to the polls, he will be handed a full set of tickets, and his name and residence will be inscribed upon the stubs by the clerks. He can then retire to the compartment, and select one ballot of each of the kinds which he intends to vote, and make such alterations upon them as he wishes. Those which he does not use he must destroy in the presence of the ballot clerks. The bill contains a clause prohibiting the peddling of ballots in the polling-places, and one authorizing the arrest, without the formality of securing a warrant, of any person who enters the polling-place and leaves it without voting. It is the intention of another clause to prohibit the distribution of ballots by anybody but the authorized ballot clerks. Voters may write their ballots, but nobody save the authorized printers shall print them.

So far as this bill takes the work of printing and distributing the ballots out of the irresponsible hands of the political workers and puts it into the hands of the responsible agents of the State, to be done at the public expense, it is a step in the right direction. But there are defects in its provisions in regard to the details of the work which we have no doubt will be remedied in Committee. There seems to be, for example, no sufficient warrant for demanding a fee upon the filing of petitions. That requirement is a recognition of the idea which prevails under our present system, that there is some obligation upon the political organizations to pay the expense of printing. There is no such obligation. The State is amply able to bear the slight expense of printing, and candidates should no more be "assessed" for that than they should be for the expense of providing ballot-boxes or any other part of the election machinery.

The most defective feature of the bill is that relating to the form of ballots. It provides for separate sets of ballots for every political party. This would lead to a confusing number of ballot books. At every general election in this city there are at least seven separate tickets and seven separate boxes for their reception, and at Presidential elections there are more. Now, suppose we had in the field two Democratic tickets, a Republican ticket, a Labor ticket, a Prohibition ticket, and a Citizens' ticket—for under the provision of the law allowing voters the right to petition for a ticket, this would be a not improbable list. On a general election we should then have six separate organizations, each entitled to have sets of seven separate books, making a grand total of forty-two ballot-books in each polling-place. The confusion and delay thus caused would be sufficient to defeat the election, for under the provisions of the bill each voter would have to be provided with the forty-two tickets, and the two clerks would be obliged to write his name and residence on forty-two stubs before he could proceed to select his ballots. Then it would be necessary for the clerks to count carefully the ballots which the voter rejected before destroying them. All this would require so much time that either our polling-places would have to be greatly multiplied, or no more than a fraction of the vote could be polled. There are other objections to the system proposed, but this of itself is fatal.

A far simpler solution of the ballot-form question is to have all the names for any particular office printed upon one ballot, with the politics of each candidate placed after his name, and a blank space at the bottom for the writing in of any name not on the list. This would require only seven or eight separate ballot-books, would not require the destruction of any unused ballots, and would not cause delay. It seems to be not only entirely unnecessary to require the writing of the voter's name and address on the stub, but, what is worse, calculated to destroy, partially at least, the secrecy of the ballot. The consecutive numbering of tickets and stubs, together with a simple provision requiring the ballot-clerks to stamp with their initials, or in some other way, the back of each ballot, would be sufficient to prevent fraudulent voting.

These and other points have been gone over with great care by experts who have been studying this subject for more than a year past, and we have no doubt that Mr. Hamilton will be glad to use the results of their labor when they shall be embodied, as they will be shortly, in a carefully drawn bill. This question is one of far too great importance to be made either a partisan or a personal one in any way, and we trust it will not be. What we need is a simple, comprehensive, and thoroughly practicable law applying to the

whole State, and there is happily so large a public sentiment in favor of such a measure that we are hopeful that the Legislature will give it to us at this session.

GLADSTONE.

During the past fortnight there has been a great deal of dining among English Liberals in honor of Mr. Gladstone's seventy-eighth birthday, and a great deal of discussion, apropos of the event, in the newspapers of both parties, of the part he has played and is still playing in English history. Nobody attempts to deny the greatness of his place in English politics and in the love and admiration of a very large portion, fully one-half, of the English, and almost the whole of the Scotch and Welsh and Irish people. His influence with "the masses," to use a term he has himself coined, is probably stronger than that of any other English statesman has ever been. On the other hand, he is hated and abused by "the classes," *i. e.*, the nobility, gentry, and clergy, with a virulence and bitterness which have hitherto been unknown in English public life. There has certainly never been in England a man sufficiently favored by fortune to be able to reach the Premiership, of whom educated Englishmen and English women permit themselves to speak with so much scurrility. In fact, they constantly denounce him even to foreigners in terms of which, before our time, national pride, if no other feeling, would have forbidden the use about any man great enough to form a British Cabinet and lead the House of Commons. And, what is also novel as well as melancholy, in a vast number of cases this denunciation is as unreasoning and as ill-informed as it is vehement. We have often tried the experiment—even before the days of home rule—of asking what it was that Gladstone had done to make him so odious, and have found that the question was a futile one, and that denunciation had no better basis than the fact that this was the fashionable view of Gladstone's character and career. Every now and then, too, one comes across Americans who have been sufficiently infected with it to look on him as in some manner a "dangerous man," whose attacks on the British Constitution are shaking the foundations of social and political order all over the world. But those who take this view of one of the greatest figures of the nineteenth century, who, with Bismarck and Lincoln and Darwin, will almost certainly go down to posterity as one of its chief glories and illustrations, ought, before his final disappearance from the scene, which in the order of nature cannot be very far off, to make themselves acquainted in some slight degree with the leading facts of his history and with the part he has played in British politics.

They will find at the very outset of their inquiries that much of the prejudice against him in England among university and professional and scientific men is due to the frequency with which his unbounded intellectual activity and fluency with the pen carry him into fields which are not his own, and in which, nevertheless, the long habit of command in politics makes him talk in the tones of a master when his knowledge is really that of a pupil. He has been so much absorbed in politics during the past fifty years that he forgets at times the strides which criticism and physical science have made since he left college, and thus sometimes permits himself dashes into controversies in which his discomfiture at the hands of the first expert he encounters is certain and even easy. His contention with Prof. Huxley, two or three years ago, about the Mosaic account of the origin of animal life, was a misadventure of this character, which gave his enemies much comfort, and, coming on the top of growing political prejudice, lost him the confidence of a good many to whom thoroughness in any knowledge one attempts to display is an indication of character. But the place in which to form a sound estimate of Gladstone, as indeed of any man, is the field which he has chosen for the display of his best energies. Politics has been so much the greater part of his life that, when one has judged him as a statesman, what is left to be passed on as a Homeric commentator or Biblical critic is hardly worth attention.

He entered political life when he left college, fifty-five years ago, as all readers of Macaulay's Essays know, as "the rising hope of the stern and unbending Tories" of that day. But he never had the real stuff of a Tory statesman in him, and his drift towards Liberalism began almost as soon as he entered the House of Commons. He was Sir Robert Peel's chief aid and supporter in that great fiscal and social revolution in England, the repeal of the Corn Laws. He soon after played the chief part in the repeal of the Navigation Laws. He then paid a visit to Italy, and spent his days in Naples, not in sunning himself at Capri, but in visiting the prisons, in which he found a dozen men of the highest character literally rotting in dungeons as plotters against the odious rule of King Bomba. He wrote when he came home an account of it all in a pamphlet, which literally rang round the world and compelled the Neapolitan Government, for very shame, to liberate Poerio and his companions.

From that day his sympathies were all, as he has himself expressed it, with human liberty. His extraordinary capacity in dealing with finance gave him the Chancellorship of the Exchequer for the first time in 1853. His first budget was perhaps the first English budget after the abolition of the Corn Laws which could be distinctly called the budget of the poor. It abolished the tax on soap and 133 other duties. It reduced the duty on tea from fifty-five to twenty cents a pound. It reduced the duty on butter, cheese, eggs, and fruit, took off half the tax then levied on advertisements, reduced the tax on policies of life insurance. But his talent was not only shown in remissions. He was equally skilled in the distribution of new taxes, in the reduction of the national debt. In 1864 he began to plead for the extension of the suffrage. In 1867 he brought in a bill for the purpose, but was defeated by a Liberal secession very much like that which has taken place on the Irish question, so that it was the Tories who actually passed the measure. When he took office again in 1868, he disestablished the Irish Church, began a reform in the Irish land laws, and carried through, in coöperation with Mr. Forster, the creation for the first time in England of a system of national education, and gave the new voters the protection of a secret ballot. Between his leaving office in 1874 and his return in 1880 he devoted himself to agitation against the war in Afghanistan and for the deliverance of the Bulgarians from the Turkish yoke. In 1881 he again attacked the Irish difficulty by a further change in the land laws, and was again driven out by the failure of an attempt to apply a still more radical remedy to Irish discontent.

In a brief summary like this, of course, no adequate idea can be given of the extent to which Mr. Gladstone has, as a legislator, influenced British politics and society. We pass over without notice numerous smaller measures—such as the redemption of the army from the system of purchase, which virtually made it the private property of the officers—by which the administration was improved or rid of useless encumbrances. In truth, when one examines in detail the marks which Mr. Gladstone has left on the statute-book, one recognizes at once the fact that no English Minister can be compared to him in the double capacity of debater and legislator, except Pitt, in the nine years between the close of the American war and the outbreak of the French Revolution. But Pitt's labors in the field of reform were brief, and the memory of his beneficent activity in that period was all but effaced by the long, bloody, and costly contest into which he plunged the country after the death of the French King. Gladstone leaves behind him no such dreadful legacy. The two conspicuous failures of his long career have been the attempt to pacify Ireland and to rescue Gordon. The issue of the first has, however, still to be seen, and the last was rather the work of the British public in one of its fits of chivalrous insanity, than of Mr. Gladstone. It was said by somebody that all the other Marshals of Louis XIV. and XV. were only "change for Turenne" (*la monnaie de Turenne*). So, also, one might say that all the other British statesmen who have appeared on the scene since Sir Robert Peel's death are only "change for Gladstone."

A SPANISH PLAY IN GERMANY.

Strassburg, January.

Paul Lindau, writing in the December *Nord und Süd* about the younger German novelists, expresses a belief that no young man engaged to-day in creative literature can affirm of himself that he is free from the influences exerted upon the intellectual current of our time by "the strongest spirits of the north and south, whether one calls them Zola, Ibsen, or Echegaray." It is only a year since the performance in Berlin of Ibsen's "Spectres," noticed in the *Nation* at the time, drew general attention in Germany to the works of the Norwegian author; and as the average reading public asked then "Who is Ibsen?" so it is asking to-day "Who is Echegaray?"—the third "strong spirit" in our group of realists.

Singularly enough, it is to the Meiningen Theatre, where the "Spectres" was played long before Ibsen had gained his present reputation, that Echegaray also owes his introduction to Germany. He has figured respectably in Madrid politics, and has been at least once a member of the Spanish Cabinet, while his literary reputation rests upon some thirty plays, none of which, however, gained him any name outside of Spain until Paul Lindau translated and adapted "Galeotto" for the German stage and it was played in the Meiningen Theatre. Last February "Galeotto" was printed in *Nord und Süd*, and during the present theatrical season it has been given in many of the leading German cities, and is everywhere admitted to be a piece of singular power.

It consists of a prologue and three acts. The scene is laid in the capital, and the time is the present. *Andreas Hennersdorf*, an elderly business man, married to a young wife, *Julie*, has for a year made his house the home of a young author, *Ernst Adenau*. The motive is the gratitude felt by *Andreas* for a great service done him years before by *Ernst's* father, and the relation between the three persons is one of ideal friendship. The prologue passes in the study of *Ernst*, who has stayed away from the theatre one evening in order to work upon a drama of his own. There is a knock at his half-open door, and *Julie* enters in evening dress, inquiring what fortune he has had in his writing, and narrating gayly how all the world had asked for him at the theatre, and wondered why he was not in *Andreas's* box, as usual. *Ernst* replies that these persons who take such a kindly interest in him may have a rôle in his drama, and then, in order to explain to *Julie* how he had taken a hint from the Francesca da Rimini episode in Dante, he reads her a ballad which he proposes to weave into his piece. The ballad relates that Dante's lovers read together the book of Lancelot, which tells how the brave Lancelot was conquered by love and stood confused before his queen until Galeotto, the middleman, brought the two together and then stole away, and that, as Dante's lovers read, they sighed, and the book became their Galeotto, and their lips touched, "and on that day they read no more." *Ernst* names the ballad "Galeotto," because he was the leading personage; Guinevere would have remained faithful, and Lancelot would have ridden off to the wars and forgotten his love, if Galeotto had not laid the wood together and touched the match and then crept away with a smile. He is the guilty person, not merely in this tragedy, but in almost every tragedy of human life.

At this point *Andreas* enters, relating laughingly, as *Julie* had done, how everybody had inquired for *Ernst* at the theatre, and how often he had to explain that *Ernst* was neither his son nor his relative. Then he asks after the progress of the new play, and, like the good-hearted Philistine that he is, tries vainly to follow the young poet's explanation of his difficulties. The main personage cannot be brought upon the stage at all, *Ernst* says, because this personage is no less than "everybody"; it is public opinion; it cannot be typified without producing a commonplace stage villain, and the catastrophe must not be brought on through villany, but merely through thoughtlessness and indifference; the conventional love story is wanting, though love and jealousy are the mainsprings of the action; the situations are as commonplace as possible; and the play has not even a title. "My dear fellow," says *Andreas*, "you are a dreamer. Come, drink a cup of tea with us, take a good night's sleep, and to-morrow we will go partridge shooting." But *Ernst* is determined to work out his task, and *Andreas* and *Julie* bid him good-night. "I will write it," he cries to himself. "I will show how out of a thousand nothings—smiles, looks, shrugs—a frightful something is born; how through their gossip they make that which was a lie at last a truth, and the title shall be 'Galeotto'!"

The first act shows us *Andreas* and *Julie* in their salon. He is troubled about something, and admits at last his fear that the high-spirited *Ernst* is not at ease in his position. *Ernst* enters with something to say to them both. He is sure that people do not understand the ideal relation in which *Andreas* has received him into the house, that the relation is misconstrued, and that it would be better for him to leave at once. For proof he points to the upper story of the same house, occupied by *Andreas's* brother, *Alfred*, with his wife, *Therese*, and their society-loving son, *Walter*. It is with these gossipers that we have to do in the remainder of the act. They are admirably depicted: they simply repeat what "everybody" says; of course, they themselves would gladly believe in the uprightness of their friends, but still society is talking about *Ernst's* anomalous position, and the family honor is endangered. *Julie* and *Andreas* answer them with scorn; the latter will insist upon *Ernst's* accepting the duties of confidential secretary; he will not allow him to leave; he will defy the gossip of fools. But *Alfred* is persistent, and, as the curtain falls, to *Andreas's* honest anger and contempt there is added the merest touch of indecision.

The second act passes some weeks later in a bare room rented by *Ernst*, who, it seems, has been allowed to leave *Andreas's* house, and who is on the eve of a long voyage. Meantime society has been busy with its gossip, and the mind of *Andreas* is at last tortured with doubt. But *Ernst* has overheard one of the gossipers in a café, has provoked a quarrel, and a duel is to be fought. *Andreas* hears of it and succeeds in substituting himself in *Ernst's* place, without the latter's knowledge, before the set time, and using the seconds and the room already prepared in the same house where *Ernst* lodges. *Julie*, too, has heard that *Ernst* is to fight; *Therese* tells her that *Andreas* is at *Ernst's* room, and she comes there to seek her husband and implore his interference. There is a touching pathos in this scene between *Ernst* and *Julie*—both of them upright, both of them knowing that it is whispered everywhere that they love each other—standing far apart in the barren room and grappling with the terrible change that has come over everything. "If our hands were to touch now," says *Ernst*, "it would be something different from what it has been." A voice demands admission—the seconds lead in *Andreas* with a sword-thrust in his breast—he finds here his wife, and, confirmed now in his darkest suspicions, he gathers his failing strength and pushes her from him pitilessly.

The last act, like the first, is in the Hennersdorf salon. *Walter* and his mother are talking with hushed voices of *Andreas*, whose state is critical, and of *Julie*. "She is only an innocent child," says *Therese;* "I was sure of it." *Ernst* is announced; he has come to speak with *Andreas;* he cannot let *Andreas* die believing in their guilt. Both *Walter* and *Therese* turn their backs at first, but afterwards soften a little. "I have lost everything," *Ernst* cries, "honor, friendship, love"; and *Therese* catches at this greedily. *Julie* is heard coming down the stairs, and *Walter* leads *Ernst* into an adjoining room. *Therese* talks of him till *Julie* cries: "Why do you whisper always, 'He loves you, you love him'? It is not so. I am still in my senses. There is no room in my heart for any sinful desire, for I love *Andreas* wholly." "But he has just confessed that he loves you; he is here yet, and you must send him away." And *Julie* replies that she will do her duty. *Ernst* comes in slowly, and this woman, in the extremity of trial, orders her only remaining friend to the door; it is her free will, she says. He stammers, "If I could repay with my life the pain I have caused you"—she starts at the words; *Therese*, then, had told the truth; he did love her. Fainting with the horror of the thought, she still cries, as he comes towards her, "Do not touch me, it would be pollution!" "You, too?" he sobs; "do not you believe in me?" And as he falls on his knees to implore her pity, *Alfred* enters from the adjoining sick-room. He orders *Ernst* out, but in another moment *Andreas* staggers to the door of the salon, and, calling *Julie* to him, makes her kneel. "In the dust!" he cries, "but the real criminal stands there. Here!" And *Ernst* steps before him, not knowing what to do. "There," cries the dying man, "I have you both. Confess!" "It is not true," *Ernst* answers. There is a last moment of suspense. "You lie," gasps *Andreas*, "and I will stamp the mark of your shame upon your forehead"; and with a final effort he strikes him in the face. A few minutes later *Alfred* is master of the house, and his first word is, "Turn this woman out." "Wait!" cries *Ernst* (and this is the moral, practically the epilogue, of the play); "we will resist no longer. From this hour this woman is mine. The world has wished it; good, we are united. Come, Julie." She lies unconscious on his arm. "We are the outcasts. You have us now as you wanted us. This woman was pure as a sunbeam, and I was a true friend to the dead man and to her. I swear it before God the judge. So it has been; but from now on we are as guilty as you have wished. Even at this moment breaks out the criminal flame. Now go into the streets and cry that you were right. And if you are asked who is guilty, look in the glass; there he stands, and there, and everywhere—yes, all of you have done it! Come, Julie, my beloved." And while he leads her away, still resting unconscious on his arm, the curtain falls.

Such is the tragedy that has thrilled German audiences during the present season; and as to the brilliancy of the dialogue, the profound knowledge of dramatic effect, and the intensity of the emotion in it, there is but one voice. It is not altogether pleasant, but the "strong spirits" among the modern realists do not often give us a pleasant story, and, for that matter, "Othello" is not particularly pleasant either. Echegaray has succeeded in doing without an *Iago;* but in making society in general do *Iago's* work out of mere idle amusement, the poet does not increase the inherent charm of the fable. But the real question, however, is whether "Galeotto" throws any substantial light upon the problems of human life and duty. Echegaray has something to say, and he says it with fierce directness, yet we can estimate better the value of his message if we note a certain contradiction between the fundamental conception of the play as expressed in the prologue and epilogue and the development of the characters during the progress of the three acts. The original conception is clear enough: two inflammable persons are to be brought together by a sort of Galeotto, and the ensuing tragedy is to be Galeotto's fault. The old problem of human responsibility is solved thus: the individual will is weak, the environment is answerable—or, as *Alfred* says in the play: "You are in the world, you live with the world, and the

world is stronger than you." Still, a society that forces the lovers together and unconcernedly causes the tragedy, ought to be scourged for its indifference. Now, this is an idea perfectly self-consistent and affording opportunity for a profound analysis of human passion; whether it would have been edifying upon the stage, if carried out, is a question upon which we cannot enter here. But in the play, as a matter of fact, we have no pair of lovers at all. *Julie* is true from first to last; it shocks us when *Ernst* claims her as the curtain falls. A moment before she shrank from his touch because she thought he loved her; a strange Guinevere! He cries with a terrible eloquence: "Your idle gossip has brought about a guilty love"; but a spectator might answer: "Look at the woman on your arm. You two may have been forced together, you may have become her sole protector, the world may believe that she loves you, but—she does not love you." She is, therefore, not a character that belongs in this piece. A Galeotto for a Guinevere, and then a tragedy, very well; but here we have a Galeotto for a saint, and the saint does not take fire with any guilty flame. And even for *Ernst*, the sudden outburst and confession of the close is not sufficiently prepared for; he has been almost, if not quite, a Galahad. In short, the poet has tried to heighten the pathos, and to make more scathing his arraignment of a gossiping society, by making the hero and heroine of the tragedy two innocent persons who remain innocent. That one of these persons discovers in himself a sudden guilt at the very end does not altogether suffice to make the tragedy inherently probable, nor to satisfy that unformulated feeling for justice which an audience always brings to the criticism of a play, and which remains unchanged despite the changing theories of the critics about the "tragic guilt."

"Call a man a thief, and at last he will steal," says Echegaray. One might answer: "Very likely; but it depends, after all, upon the man. Look at *Julie* in your own play." But when the Spanish realist adds: "It is a crime to laugh and jest about thievery, and impute it idly to others as if it were a light matter," there is no answer that one can make. He has told a bitter and wholesome truth.

B. P.

Correspondence.

PIG-IRON AGAIN.

To the Editor of The Nation:

Sir: Your correspondent "H.," in No. 1175 of the *Nation*, in "seeking light" on the tariff, says he "speaks from knowledge," and that

"a ton of iron on the furnace bank represents labor and nothing else. The average cost now, taking the country over, is not less than $15.50 to $16.00—all labor. Take this to Chicago or St. Louis at an average freight, say, of $3.00, and it represents not less than $18.50 per ton—labor and freight. Add $1.00 per ton for profit, and you have just about the average market to-day at the great Western centres. . . . Take off $6.72 protection, and there is an instant advantage of at least $5.00 per ton to the foreign manufacturer in the very centre of the American continent. My furnaces have plainly one of two courses to pursue—shut up or reduce cost (labor) by $5.00 per ton, or 33 per cent. . . . Do you think American mechanics, artisans, and laboring men, and the farmers, who find manufacturing centres their highest-priced markets, will permit any party to stand which advocates such action?"

It is a favorite expression of protectionists to say that a manufactured product is "all labor." If "H.'s" pig-iron is all labor, I infer that his "three furnace companies" own the ore and coal mines as well as the lands from which fluxing material is had, and that these mines are worked by his companies, who use no other materials, and hence pay no royalties or gross profits on other people's products. If this be so, and his labor cost in a ton of pig-iron is $15.50, his properties must be so disadvantageously situated that, tariff or no tariff, he will shortly have to get out of the business unless he joins some "trust" or "combination" to restrict the growth of other American furnaces, and prevent further employment of American labor in that channel.

The year 1880 was described in the census reports as one of "great prosperity for the iron industry, when labor was in demand and wages promptly paid." Mr. Edward Atkinson, in his 'Distribution of Products,' page 93, quotes Mr. Jas. M. Swank and Prof. R. Pumpelly, "two of our most competent experts," showing the number of men and boys engaged in making our iron in 1880, as below:

In coal mines producing that part of the coal which was used in iron furnaces, about	20,000
In iron mines	31,668
In blast furnaces	41,875
Total	93,543
The sum of the wages of this force was	$28,458,822

Practically this embraces the great bulk of all the wages paid to make our iron. The total product in that year was 3,781,021 tons, at a labor cost of about $7.50 per ton. But as this included all the badly placed and uneconomically managed furnaces, it follows that if any paid more wages than the average to secure the same results, others must have paid less, and the tariff becomes a scheme to keep the ill-deserving going. If it be true that "taking off the tariff of $6.72 would give an instant advantage to the foreign manufacturer in the very centre of the American continent" of $5 per ton, it is the strongest argument I have yet seen for taking it off. Ocean freight, marine insurance, commissions, etc., surely bring the protection extended to this industry up to $8 per ton at our sea-ports. Our domestic production for 1887 was, according to Mr. Swank's report in our daily papers of January 4 and 5, 6,250,000 tons. Eight dollars protection on this amount is fifty million dollars—or taxes levied upon the people of the United States, to support our iron furnaces, greater than we now expend to support our army and navy.

Fifty million dollars is 10 per cent. net profits on $500,000,000 worth of finished manufactured articles. If, therefore, a tax collector were stationed at the doors of our factories, and from our machinists, hardware, agricultural-implement, and sewing-machine makers, locomotive, car, and steam-engine builders, cutlery and firearm makers, and similar industries were to collect 10 per cent. on $500,000,000 worth of their products, and hand it over to the furnace men for their services in "making iron harder to get," it would be the plain and unadulterated exposition of what protection on iron means. And yet, in despite of these heavy burdens, we export (and seldom import) many of these highly finished articles, involving as they do a high percentage of labor-cost and relatively limited quantity of crude material—a clear and overwhelming proof that American labor, while the best paid, is the cheapest in the world.

It is, therefore, to me, a wonder that "American mechanics, artisans, and laboring men" who use "H.'s" iron will consent to give him $8 per ton more than it is worth, in view of the fact that it handicaps their own industries and reduces their own wages by that amount. If we now send abroad so many manufactured articles made from our high-priced iron, what growth might we not aspire to when his heavy-taxing hand is taken from us?

And with reference to "American farmers, who find manufacturing centres their highest-priced markets," they already supply many "manufacturing centres" across the Atlantic, whose people are willing to return a ton of iron for ten bushels of wheat, instead of a ton for fifteen bushels, which "H." exacts. It is not necessary "to sweep the board and bring in free every form of cotton, woollen, silk, iron, steel, jute, chemical, and other manufactures." A reduction of a tariff tax on raw and crude articles means frequently a greater lessening of both tax and revenue than is apparent by a reference to the revenue derived from the crude materials. In 1885 (the latest year for which I have reports), the imports and duties on wool and woollens show as follows:

	Value.	Duties.
Wool	$9,474,263	$3,164,295
Woollens	36,176,705	24,294,938

Is there any intelligent man who has paid attention to tariff discussions who believes that an abatement of the wool duties of $3,164,295 will reduce the revenue and taxation only to that extent? Can it not be seen, from a glance at the figures, that the tax on the wool is nearly 10 per cent. of the value of our imported woollens? If, therefore, American manufacturers could secure a reduction of the duties on wool, they would be able to manufacture nearly all the *woollens* which come in, reducing the revenue nearer $30,000,000 than $3,000,000. Such a result would simply give increased activity to American industry. The greater number of operatives required to make the additional quantity of woollens would still eat mutton to a greater or less extent. The Ohio and Pennsylvania cowboys who, by their presence in Washington, seem to think that the place to herd sheep is in the halls of our national Capitol, would find larger "manufacturing centres" in which to sell.

What is true of wool and woollens is true of other industries which use "H.'s" products. It should always be remembered that manufactured articles, as a rule, are sensitive commodities, which readily respond in increased production and consumption to any decline in cost. In other words, their market is widened; a fact which finds extreme expression in the homely proverb, "If wishes were horses beggars might ride." It does not mean the "degradation of labor." The farmers and the working classes are themselves the great consumers. It means that they can secure comforts and labor-saving contrivances for themselves which, under higher prices, would be beyond their reach. And unless it can be shown that taxes create wealth, and protectionists have a patent for making something out of nothing, the job of helping "H.'s" industry by taxes, except at the expense of others, is hopeless.

Reduction of taxation will benefit, not injure the manufacturing industries. Republican government owes a living to no one—except its own servants.

Samuel Seay.

Nashville, Tenn., January 13, 1888.

To the Editor of The Nation:

Sir: I read with great interest the letter of a pig-iron manufacturer that appeared in your last issue. He stated that pig-iron represented nothing but labor, and that if the duty were removed, he should either be compelled to shut up or reduce wages 33 per cent.

I read with as much interest, but less satisfaction, the editor's reply, which was evasive, as it seems to me, holding practically that pig-iron was not, according to the present plan, to be

placed on the free list. But according to the average cost of labor in making pig-iron in Pennsylvania in 1885, which was a fraction more than $1.83 per ton—present cost may be less—the 33 per cent. is far from being reached. I recognize that it costs something in labor to dig iron ore and coal and to prepare coke and limestone, but these expenses are to be credited to the "industries" named. Rent, inferior furnaces and ovens, and cost of transportation, are, it seems to me, the big ogres that reduce the profit, and not labor. If profit was even less, the aggregate upon a larger volume might be larger. International competition might also bring other expenses down, as it has reduced cost of wheat raising and wheat transportation. Let me also ask what the Pennsylvania pig-iron makers are going to do with their Southern rivals, who, on the best of expert testimony, can produce for $8 a ton, at a good profit, and at a labor cost of $2!

W. A. C.

HARTFORD, CONN., January 10, 1888.

TO THE EDITOR OF THE NATION:

SIR: In the letter of "H." on page 11 of your issue of January 5, I find the following: "A ton of pig-iron on the furnace bank represents labor and nothing else. The average cost now, taking the country over, is not less than $15.50 to $16 per ton, all labor."

In J. Schoenhof's 'Destructive Influence of the Tariff,' etc., p. 80, I find this:

Mr. Joseph D. Weeks of Pittsburgh, one of our best experts, gives the price paid for labor in Pittsburgh to make a ton of pig-iron:

Labor on mining ore for ton of pig-iron at $1.40	$2 38
Labor on mining coal and making coke necessary for ton of pig-iron	1 25
Labor on mining limestone	30
Labor at furnace	1 25
	$5 18

Here appears to be a remarkable discrepancy. I am not at all acquainted with the details of the manufacture of pig-iron; but, viewing the matter à priori, it seems either that no capital at all is required in the manufacture of pig-iron, or else that your correspondent has made the mistake of confounding stored-up labor or capital with wage-labor. Please enlighten us on this point, and oblige a constant reader.

Yours, JOHN W. GARDNER.

NORTON HILL, N. Y., January 9, 1888.

TO THE EDITOR OF THE NATION:

SIR: Like your correspondent "H.," I, too, with thousands of my countrymen, am interested in the tariff question. With protective education and proclivities, I am, nevertheless, a farmer, and reside inland, and am therefore entirely dependent on the iron business, whether in horse-shoes, tires on wagons, or railroad iron for the transportation of our various products to market. How increased imports would prevent any reduction of the revenue, if we were all sailing under a free-trade flag, I fail to see.

"H." says a "ton of pig-iron on the furnace bank represents labor and nothing else." At Chicago or St. Louis the freight, $3 per ton, is added. I have no doubt his statement is accurate. What farm product represents any such amount of protected industry? Certainly, it is not his wheat, butter, meat, eggs, poultry, or other food for man, nor the farmer's corn nor oats that furnish food for beasts.

I know laborers are more lavish with their money than other investors or capitalists. But if any farmer possessed of more land than he and his family can work, is not hiring at advanced prices in order to have iron men, in the shape of railroads, advance his freights to furnish the farmer a larger internal or home market, the question is beyond me.

I am naturally and by education a Blaine Republican, but how Blaine is to be elected in the free-trade and doubtful States, under our electoral system, which needs electors and not majorities, or why it is to a farmer's interest, if away from tide or water transportation, to favor either corners, monopolies, or large dealers paying enormous rentals, is a problem I have failed to solve.

Very respectfully, HARDWOOD.

THE POTATO TARIFF.

TO THE EDITOR OF THE NATION:

SIR: The plaint of the New York potato-dealer referred to on page 2 in No. 1175 of the *Nation* suggests a reply to the stock protectionist argument that if a duty on a given article be removed, the amount of it would at once be added by the foreign producer to the price of the article when exported by him. "If," says he, "they [the Scottish, English, and Dutch potato-producers] send as much as they do while there is still a fifteen-cent tariff on potatoes, what would be the limit of this supply *if that much profit is added to each bushel?*" It is claimed by the protectionists that a tariff, instead of enhancing prices, really reduces them, because, by securing the home market to home producers, competition in that market between home producers reduces prices far below the amount of the duty. But competition is fully as keen in the foreign as in the home market, and the canny Scot or thrifty Hollander would not hesitate long about cutting prices on potatoes or anything else in order to make sales to the American importer. Doubtless the timid New York potato-dealer fears that the English, Scottish, and Dutch potato-producers would form a "Potato Trust," and mutually pledge each other not to sell potatoes to any American dealer at a less price than that ruling in the European markets, plus the fifteen-cent duty removed. Let him be consoled, however, for if the duty be not added to the price of potatoes by the American producer because of competition, neither will the amount of it be added by the foreign producer, for the same reason. CLAYTON HARRINGTON.

OGDEN, IA., January 7, 1888.

COMMERCIAL UNION WITH CANADA.

TO THE EDITOR OF THE NATION:

SIR: In the short paragraph that you devote to Canadian affairs in your last issue, you do not exaggerate the importance of the East Northumberland election as an evidence of the growing popularity of the commercial-union movement. Mr. Goldwin Smith has already pointed out that the strength of that movement is not even fairly represented by the result of that election, for the reasons that, in the first place, it was not made at all clear that the return of Dr. Mallory could have any practical effect in bringing about a commercial union, and, in the second place, that the Government candidate took the sting out of Dr. Mallory's candidature to a considerable extent by soliciting votes for himself as a champion of the largest measure of reciprocity. The difference between "commercial union" and "the largest measure of reciprocity" is clear enough in one aspect of the matter, but the two things are not so essentially different as to make the defeat of the commercial-union candidate a conclusive evidence that a majority of the voters are not in favor of the principle for which he stood.

The comments which follow your mention of the result of the election furnish much food for reflection to the advocates of the movement on this side of the line. You allude to the fact that Mr. Chamberlain keeps pointing out to the Canadians that political union must follow commercial union pretty closely. Without attempting to pass judgment upon this view of the matter, which is keenly debated here, I wish to assure your readers that the moment it is made clear to the Canadian mind that this is the correct view of the question, that moment the commercial-union movement will receive its quietus on this side of the line. You will observe, if you are at all interested in following the course of the discussion here, how exceedingly careful the advocates of the movement in this country are to dissociate it from any connection with what are known as annexation sentiments. The evidences of this anxiety are clearly apparent in the resolution adopted a few months ago by the conference of provincial premiers at Quebec; in the letter of Hon. Mr. Fielding, Premier of Nova Scotia, read at the recent dinner of the Merchants' Association in Boston; in the furious attack made by the St. John *Telegraph* (a commercial-union advocate) upon the editor of its contemporary for suggesting annexation as a possible solution of the question; in the constant and vehement disclaimer of annexation sentiments by the leading Liberal organ in Toronto, and in the manifest reluctance of the Halifax Liberal organs to commit themselves to annexation views. There is, it is true, a certain dash and raciness about Mr. Longley's unquestionably clever advocacy of the measure which overstep the boundary that its more sober and politic advocates have set to the discussion of the question; but even he would not be willing to place himself on record as a Canadian politician in favor of commercial union, with political incorporation as the necessary sequel.

I do not propose to discuss here the desirableness or otherwise of a political union between this country and yours. From the standpoint of material interests the matter is really too plain for argument. It might fairly be contended, moreover, that such a union would immediately elevate the character of our statesmanship and ennoble our public life, by giving us large and living political issues in lieu of the petty questions of harbor appropriations and branch railways on which of late our election contests have been too frequently fought out. If we could be assured of perpetual amity between the parent country and its lusty offspring on this side of the Atlantic, all reasonable sentimental objections to such a union would also vanish, and if such assurances were possible, the complete political union of the whole continent under one sovereignty, in perpetual alliance, offensive and defensive, with their kin beyond the sea, leading the civilization and preserving the peace of the world, would surely be a consummation devoutly to be wished.

The prospect of the perpetual existence of an international boundary of four thousand miles, with its parallel rows of custom-houses and fortifications, with the union jack and the stars and stripes perpetually confronting each other (to borrow from Mr. Lane's excellent speech at the Boston banquet), with its constant exposure to the risk of collisions, and the obvious possibility of a destructive and desolating war, is certainly not a very pleasant one to dwell upon, however jauntily it may be welcomed by a few narrow and shallow organs of imperialism in this country. But at the same time, when you say, as you do, that no intelligent man doubts that a political union between the two countries will some day be brought about, you state the case too strongly, and I am satisfied that you altogether underrate the strength of Cana-

dian national sentiment. That sentiment is weakest in the province of Nova Scotia, but even here, although a provincial election was carried a couple of years ago in favor of the repeal of the Canadian union, there is not more than one county in the province, if I am justified in making even that one exception, in which a seat would be carried for annexation, while in Ontario and New Brunswick it is almost regarded as sinful to suggest such a thing as annexation even as a remote possibility of the future. I will not at present ask for any of your valuable and well-filled space to account for the strength of this sentiment, but will only say in conclusion that a commercial union, with the concomitants and the sequel that you think must necessarily accompany and follow it, is not at present, and cannot be for many years to come, within the range of practical politics.

B. RUSSELL.

HALIFAX, January 5, 1888.

DE GUSTIBUS.

TO THE EDITOR OF THE NATION:

SIR: My text this time is furnished by the letter of Mr. T. J. Albert in the *Nation* of January 5. He complains that politics is no longer a question of Republicans or Democrats, but of Cleveland or Blaine men; that for the first time we lean upon the counter-opinions of the Presidential candidates; that this publication of personal views is substituting pronunciamientos in place of platforms and national conventions, and thus reducing this country to the level of the South American republics. And he urges that if the politicians do rally to the support of this or that man, the voters should unite in choosing discreet and able men as delegates to a convention to make a platform, and nominate men who will represent its principles.

It seems to me that just this thing which he complains of is one of the most hopeful signs of the times, and that personal leadership is the one thing absolutely necessary to keep the politics of this country, local as well as general, from falling into utter chaos. National conventions and platforms did well enough when this country did not need any governing. But the world never has been and never can be governed by means of them. It always has been and always will be governed by men—propositions of which the history of France is one long illustration from 1789 to this day, and which, when we once frankly recognize them, will bring light into a great many dark places in our politics.

The word "pronunciamiento" has got a bad odor, because the Spanish generals who use it proceed to slaughter and banish their opponents and set up a military despotism till some stronger man takes his turn. But in the sense in which Mr. Albert uses it it describes perfectly such measures as Mr. Gladstone's Home Rule and Irish Church Bills, Disraeli's 1867 Reform Bill, Earl Grey's Parliamentary Reform Bill, Sir Robert Peel's measure for repealing the Corn Laws, and a host of others of the most beneficent political measures of modern times, while it is just the wrangling over the generalities of platforms and the efforts of party wire-pullers to evolve some order and compromise out of jarring factions, that make Congress today a spectacle for gods and men.

There is no one lesson which the history of the world teaches more thoroughly than that a few disciplined men, implicitly following a leader, can defeat and overthrow many times their number, following only ideas which each individual or group interprets for itself. This country is already not without examples of this, and will furnish some sad ones if it persists in the methods which Mr. Albert advocates.

The great mass, and the best part, of the people of the country are quite too busy in getting a living to have any definite opinions upon the tariff, civil-service reform, finance, or any other purely political question, but they are quite susceptible of enthusiasm for individuals; and the way to promote any cause, good or bad, is to connect it with some personality. If those who desire good ends are too fastidious to do this, they are shut off from complaining of those who, desiring bad ends, have no such scruples. What may be thus achieved is well shown by the letter of Mr. Whittlesey which precedes that of Mr. Albert. He says: "The late message has cleared the air, and one of the surprises of the next Presidential campaign will be in the number of cultivated men who will resume their functions as citizens"—which is just owing to this element of personality. And if Blaine and Cleveland should be the candidates, the next campaign will tell more clearly than any ever has done what the real wish of the country is as to tariff and revenue reform. I think your readers, each in his own neighborhood, will have noticed what a sudden desire has seized everybody, since the President's message, to know something about the tariff; just as, some years ago, when Butler was a candidate for the Governorship of Massachusetts upon a greenback platform, although it had been previously impossible to get anybody to attend to the subject, the halls were suddenly crowded with audiences greedy for information, and the demand for speakers far outran the supply.

The fact is, there is still not personality enough. The President has fired a shot in the air and met with a hearty response, but the issue raised is the subject of an internecine conflict between private interests in the lobby as to which the public know nothing. If a Secretary of the Treasury, representing the views of the President, and through him of the nation, stood upon the floor of Congress, holding in his hand a definite measure of revenue reform, the struggle, which now rages under ground, would at least be brought out to the light of day, so that the country could judge of the arguments and motives which are brought into play. A leader of opposition would of necessity be developed, and the country would not only take sides with individuals, but have an opportunity of getting some reasons for its choice.

Mr. Albert would probably be horrified at the idea of the Cabinet having seats in Congress, but I believe it is the indispensable preliminary to an adequate settlement not merely of the tariff, but of a good many other political questions which are piling up upon us.

G. B.

BOSTON, January 14, 1888.

OUR LAGGING POST-OFFICE.

TO THE EDITOR OF THE NATION:

SIR: In view of the favorable financial aspect of the Annual Report of the Postmaster-General, I notice in some of the newspapers which have reached me here various hopeful expressions that soon the rate of postage may safely be still further reduced. But in view of the absurdly high and extravagant scale of living on which (thanks to our protective system) in America we have to live, and which we seem to enjoy, is not postage relatively cheap enough now? At least, is it not worth while to do something to put our postal service on a level with that of other civilized countries? It has been often said—and the sting lies in the fact that the charge is true—that our postal system in its management simply lags behind that of other great countries. Is it not high time that *postal delivery* was greatly extended, so as to embrace all towns, and in the more settled portions of our country even the rural districts? To intelligent people here our "going to the post-office" is simply incomprehensible. Some time ago I experienced considerable difficulty in explaining to a postal clerk here, who was disposed to interrogate me as to the P. O. box direction on a letter addressed to a person in a small town, what "going to the post-office" in America meant. I hardly need say that he seemed to be highly amused, and I may add that I was not a little ashamed. The waste of time and manifold inconvenience connected with going for one's mail two or three times a day, for example, in a town of two or three thousand inhabitants, is at once ridiculous and, in an age that seeks to add to efficiency by time and labor-saving appliances, hardly civilized.

It is not the purpose of this letter to point out *how* this reform may be accomplished, but may I not be permitted to suggest that the expense would not be so great as at first supposed, for the post-office would not need to be the expensive (?) luxury that we now too frequently see, and the force employed in the office, except as the postmen might be utilized there, would be comparatively small? Instead of three or four persons using a considerable portion of the time that belongs to the public in "canvassing the political situation," we should secure some real service. Nothing but ignorance on the part of the people who are not fortunate enough to live in free-delivery towns, of what a service real delivery is, has so long reconciled an indulgent public to what is almost a grievance.

P.

BERLIN, PRUSSIA, December 26, 1887.

DARWIN'S CLASSICAL TRAINING.

TO THE EDITOR OF THE NATION:

SIR: That must have been a very extraordinary teacher who contrived to instruct Darwin in the classics without giving him any training in habits of observation and reasoning. To be sure, learning declensions and conjugations is not necessarily an exercise of the reason, but it certainly involves systematic observation, since all memory depends on antecedent observation. But a boy might know "by heart" all the forms in the Greek grammar, and yet he could not understand the simplest Greek sentence without using his reasoning powers.

To read Latin and Greek it is necessary (1) to notice carefully the significant prefixes and suffixes—*i. e.*, to observe; (2) to determine from these the relation of the words to one another—*i. e.*, to reason. For example, when a boy reading Greek has to translate a circumstantial participle, if he is properly trained he will consider the connection of thought, and translate by a clause beginning with "when," "if," "because," or whatever conjunction brings out the relation expressed. Is there no exercise of the thought power in this?

A teacher of language has his laboratory as well as he who teaches natural science. But his specimens are words and sentences instead of natural objects. Is not dissecting an oration of Cicero as good a mental discipline as dissecting an animal?

Furthermore, the study of Latin and Greek affords more exercise of the reasoning faculty than the reading of, for instance, French. For in the former we have to observe the forms of the words, and reason chiefly from that how to put them together, while in French the order of the words in most cases shows the construction. Viewed simply as a means of mental gymnas-

tics, then, the study of the classics is valuable. What practical value it has is a different question, to which Mr. Darwin's words, quoted in your last issue, do not seem to refer.

I should not call attention to these very obvious facts did not your correspondent's extracts from Mr. Darwin's writings ignore them altogether. C.

ANNANDALE, N. Y., January 16, 1888.

THE PROGRESS OF COEDUCATION.

TO THE EDITOR OF THE NATION:

SIR: Any one interested in the progress of coeducation may find it useful to examine the following tables, which are compiled from the reports of the Commissioner of Education for 1874 and 1884-5 (the latter being the last issue at hand). In every case the numbers give the sum total of both scientific and classical students:

COLLEGES FOR MEN.

	1874.	1884.
Yale	798	877
Amherst	331	335
Harvard	786	1,082
Williams	161	254
Dartmouth	342	400
Princeton	407	514
Columbia	316	573
University of Pennsylvania	195	344

COLLEGES FOR MEN AND WOMEN.

	1874.		1884.	
	Men.	Women.	Men.	Women.
Wesleyan	176	7	185	16
Bates	97	3	104	20
Colby University	75	7	117	13
Cornell	436	32	523	40
Boston University	36	16	109	57

COLLEGES FOR WOMEN.

	1874.	1884.
Vassar	265	238
Wellesley	—	515
Smith	—	296
Bryn-Mawr	—	(1887) 79

In addition to these colleges for women, it must be remembered that the Harvard Annex is in a highly prosperous condition, that Evelyn College for women has recently been established at Princeton, and that a new female college is soon to be erected in Massachusetts.

It seems to me that an unprejudiced examination of these figures must lead to these conclusions: That colleges limited to one sex enjoy a remarkable degree of prosperity; that women prefer colleges open only to women; that the necessity does not exist of admitting female students to colleges heretofore reserved for men; that in the Eastern section of the country collegiate coeducation will not be extended. Unquestionably women should have access to collegiate training, and undoubtedly there are colleges, reserved for women, well equipped and of high standing.

In the West there is a very different state of things, and it is hard to deduce conclusions. The Eastern colleges draw students largely from this section of the country, which goes to show that certain colleges are more popular than others—very possibly the question of coeducation determines the choice of the college selected. The colleges of the West are overwhelmingly coeducational, yet many of them are colleges only in name; and people who object to coeducation for the college do not oppose it for the school. The State universities, being supported in some measure by public taxation, will always be open to both sexes; as far as other institutions are concerned, as time goes on, things may adjust themselves as they have in the East. It is interesting to know that a women's college is to be established in Denver, the seat of a coeducational university; that the Californian Women's College is prosperous; that Mt. Holyoke Seminary has established a college course, and therefore extended its corporate name, and that (according to newspaper report) the collegiate department of Western Reserve will hereafter close its doors to women.

I am, etc., WILLIAM A. MERRILL.

COLLEGE HILL, OHIO, January 13, 1888.

Notes.

WE are pleased to learn that Mr. George P. Upton has actually in preparation the sequel to his 'Standard Cantatas' which we recently urged upon him in our review of the work just named. His 'Standard Symphonies' will appear in the fall, will include the nine of Beethoven, the six most popular of Haydn, the three great ones of Mozart, all of Mendelssohn's and Schumann's, two of Schubert's, two of Gade's, four of Brahms's, a liberal representation from the modern romantic school, and representative symphonic poems such as Liszt's and Saint-Saëns's—the best of them to be accompanied by musical illustrations. It is possible a fifth volume may be added to the series, devoted to suites, overtures, and miscellaneous orchestral compositions, in the course of another year.

The Military Order of the Loyal Legion of the United States contemplates a new edition in book form of the thirty-seven papers read at its stated meetings in 1883-1888. Many of these are now very scarce. They "give accounts of personal experiences and observations of actual participants in the stirring events to which they relate." If enough copies are subscribed for at the cost of manufacture, $2.00 per volume, two octavo volumes of about 400 pages each will be handsomely produced under the title, 'Sketches of War History, 1861-1865,' and issued successively. The pages will not be stereotyped. Subscriptions should be addressed to the Recorder, Capt. A. H. Mattox, P. O. Box 86, Cincinnati.

G. P. Putnam's Sons' spring announcements include 'The Fall of New France, 1755-1760,' by Gerald E. Hart, President of the Montreal Society for Historical Studies; 'Bibliotheca Jeffersoniana,' a list of works written by or referring to Thomas Jefferson, compiled and annotated by Hamilton B. Tompkins (uniform with the Hamilton and Franklin series of the same publishers); a 'Life of Lincoln,' by Noah Brooks; 'Governor Chamberlain's Administration in South Carolina: a Chapter of Reconstruction,' by Walter Allen; a new edition of Simon Sterne's 'Constitutional History and Political Development of the United States'; 'The Relations of Church and State in the United States: or, the American Idea of Religious Liberty, and its Practical Results,' by the Rev. Philip Schaff; 'The Religious Aspect of Evolution,' by President McCosh; Prof. Luigi Cossa's 'Taxation: its Principles and Methods,' edited and annotated by Horace White; 'Property in Land: an Essay on the New Crusade,' by Henry Winn; 'Essays on Hysteria, etc.,' by Mary Putnam Jacobi, M.D.; 'Proverbs and Phrases of All Ages,' classified, by Robert Christy; 'Poems of the Plains,' by Thomas B. Peacock; 'Andiatorocté, and Other Poems,' by the Rev. Clarence A. Walworth; 'Before the Dawn,' a story of the Paris Jacquerie; and sundry additions to the "Story of the Nations" series.

Professor Villari's enlarged edition of his 'Savonarola,' the source of inspiration of George Eliot's 'Romola,' has compelled a new translation, which has been undertaken by his wife under his supervision. It will be published by T. Fisher Unwin, London, who will illustrate it with portraits of famous men of the time, and with numerous plates.

Brugmann's 'Elements of a Comparative Grammar of the Indo-Germanic Languages,' vol. i, "Introduction and Phonology," translated from the German by Joseph Wright, Ph. D., will be published immediately by B. Westermann & Co. The same firm have just ready 'Elia of Sobha's Syriac Grammar,' edited and translated from the MSS. in the Berlin Royal Library by Richard J. H. Gottheil.

The interesting announcement is made that the National Museum at Washington has undertaken the formation of a study-collection of casts of Assyrian and Babylonian Antiquities in association with the Johns Hopkins University, beginning with those preserved in this country. The Johns Hopkins University will attend to the proper arrangement and cataloguing of the Assyrian collection in the National Museum, under the supervision of Dr. Paul Haupt, Professor of Semitic Languages, and Dr. Cyrus Adler, assistant in the Semitic courses, who will also coöperate in the work of forming the collection and of securing the loan of objects to be copied.

'Turning Points of Thought and Conduct,' by Dr. James Morris Whiton, is in the press of Thomas Whittaker.

Glancing over the contents of vol. ii of *Scribner's Magazine*, as it comes to us complete and bound, we meet the closing letters in the much-discussed Thackeray series; the two striking papers by Prof. Shaler, on the "Instability of the Atmosphere" and on "Caverns and Cavern Life"; Dr. Sargent's two papers on physical proportions and athletic development; Mr. J. C. Ropes's second paper in illustration of Napoleon and his times; the Bowne letters, since made into a book—'A Girl's Life Eighty Years Ago'; Mr. John S. White's "Viking Ship," and not a little else that we read with pleasure and profit on its first appearance in this monthly.

One of the best conceived and best executed works of its kind, Dr. Israel Ward Andrews's 'Manual of the Constitution of the United States' (Cincinnati: Van Antwerp, Bragg & Co.), has just undergone a second revision, with special reference to its greater adaptability to school use. We prefer the typography of the first edition, but in all other respects the present is welcome as continuing the view of the Constitution and laws to the latest date. The Constitution of Illinois, taken as a specific example of State constitutions in the first edition, has given way to that of Ohio—no doubt to meet a local demand.

The 'Elements of Analytical Mechanics,' by Prof. P. S. Michie, published by Wiley & Sons (1887), is a most excellent book of its class. It is the second edition, but differs very much from the first, which was never published. It is on the plan of Bartlett's and Wood's books on the same subject, but is confined to the mechanics of solids. We are not acquainted with any American book which gives so satisfactory a discussion of the rotation of a free rigid solid due to impulsive forces. There is a very good discussion of the Potential, and likewise a good introduction to graphical statics. The author has evidently taken great pains to be brief and clear, and seems to us to have succeeded admirably. Here and there are slight errors, mainly typographical. The author makes *density* and *specific gravity* synonymous; but the two are numerically the same only when the mass of unit volume is assumed as the unit of mass.

The fourth volume in the series of 'Mineral

Resources of the United States,' issued by the Geographical Survey at Washington, covers the calendar year 1886, and is sold at the low price of fifty cents. Its chapters on mineral ores, coal, petroleum, natural gas, building stones, fertilizers, etc., etc., are full of information for the merchant, mechanic, or simple layman. Some economical lessons are obtainable. It appears that the South Carolina phosphate output for the year in question fell below that of 1885, owing to a break in prices. Any very marked decrease in this region would make available a fairly good phosphatic rock in North Carolina, not so readily mined. The diminution in the supply of the best quality of Bavarian lithographic stone is stimulating search for its equivalent in this country with good promise in Tennessee. But, says the reporter, "a drawback which has thus far presented itself in the development of deposits of lithographic stone in the United States consists in [the difficulty of] obtaining men sufficiently skilled in quarrying, selecting, and dressing the stone, to put it into the hands of the consumers in the best shape." We "protect" this infant industry by forbidding the importation of Bavarian workmen having the requisite skill, under contract.

Whitaker's Almanack (New York: Thomas Whittaker) puts in its familiar appearance for 1888. Those who know all that is in it are few; those who go to it in vain are perhaps fewer still.

The revival of *Book Notes* at Providence, R. I., by Mr. Sidney S. Rider is a matter of congratulation. It will be published—a little four-page leaflet—fortnightly, at fifty cents a year, returning in any given number, we venture to predict, the whole price of the subscription. Mr. Rider's "historical, literary, and critical" personality (to misapply his subheading) is very racy and individual, especially when he has occasion to express himself about the tariff, as every book-lover must, sooner or later. Mr. Rider's book notices are always independent and often learned, as in his present friendly exposure of the shortcomings in Mr. Hammett's 'Bibliography of Newport.' Back numbers of the former series of *Book Notes* command a considerable premium, and we wish for the new a circulation which will inure to the benefit rather of the editor than of antiquarian dealers.

To another periodical, not new, we extend our good wishes—we mean the *Swiss Cross*, now entering on its third volume (New York: N. D. C. Hodges, 47 Lafayette Place). The significance of its name is apparent when we mention that it is the monthly organ of the Agassiz Association, a widely distributed body. We cannot expect even so well conducted a magazine as this, which appeals to extremes of youth, to attain the popularity of the children's magazines addicted to stories mostly. The reason why our education neglects the cultivation of the observing faculties is to be found in the constitution of the average mind, which is open to what addresses the imagination and the capacity for acquiring languages, but only now and again takes kindly to science. The same reason determines what reading children like most. As they get too much of fiction, in our opinion, we should like to see the *Swiss Cross* act as a corrective where it may.

To the Class of 1881, Harvard College, Mr. William Coolidge Lane (of the Library) has made a report on "The University during the Past Years"—a little pamphlet of twenty-one pages as it comes to us in a reprint. We need not go into the details of his review of a very noticeable period in the history of the College, including the logical extension of the elective system to the Freshman year. The report is adorned with heliotype views of the new buildings, the John Harvard statue, etc.

We have also before us the first annual report of the Harvard Law School Association, a very cheerful document. The membership has grown to 644, and the Association, while not satisfied with this figure, takes credit for having augmented the attendance at the Law School. It will repeat its annual dinner the day before Commencement. The Treasurer, who confirms membership with a receipt for three dollars, is Mr. Winthrop H. Wade, 10 Tremont Street, Boston.

President Angell's report to the Board of Regents of Michigan University notes an increase of thirty-six in the attendance of women during 1886–87, and a relative gain in numbers with respect to the male students. They now form nearly seventeen per cent. of the whole. He bears witness to their capacity to meet the severest tests of the common discipline, and says: "The advantages derived from the University courses have proved as helpful to the women in their lives subsequent to their graduation as to the men." Of both sexes, he says: "The number of farmers' children exceeds every other class." "Harvard University now distributes to students $66,000 a year, a sum larger than our total receipts from students."

M. Pierre Viala, Professor of Viticulture at the Montpellier Agricultural College, was sent to this country last year by the French Government to examine the American vines, and discover which species would be best adapted to the soil of southern France. His preliminary report to the Minister of Agriculture, which is published in the *Revue Scientifique* for December 24, describes briefly the different American vines, three of which he specifies as peculiarly suited to that region. His general conclusion is, that "we have to rely especially on the American stocks bearing our indigenous varieties in order to be assured of the revival of our vineyards and to maintain the legitimate reputation of the French wines."

The Paris Bureau des Halles et Marchés has published an interesting table showing the comparative amounts of the different principal articles of food consumed by a single person in the years 1881 and 1886, which seems to indicate a slight decrease of the general wealth. The Parisian, for instance, ate more bread in 1886 than he did five years before, but less fish and butcher's meat, though more pork and sausages. He had more oysters and cheese, but less butter and fewer eggs. His consumption of wine fell from 224 litres in 1881 to 186, and there was also a falling off in his beer-drinking, which was not made up by a more than five-fold increase in his consumption of cider, perry, and hydromel.

The most interesting paper in the December *Petermann's Mitteilungen* is Dr. Hans Meyer's account of his ascent of the east African mountain, Kilimanjaro, in July of last year. All his companions gave out before the summit was reached, and he climbed the last snow-field in a blinding storm of sleet, only to find himself confronted by a perpendicular wall of ice over a hundred feet high, which seemed to surround the crater. An excellent map accompanies the paper. Following this are extended notices of three of the maps in Berghaus's 'Physical Atlas,' the meteorological and those showing the dispersion of plants and animals. Dr. Schinz continues his caustic criticisms of Mr. Farini's African travels. From tables prepared by M. Boinet Bey, the population of Egypt is shown to have increased from 4,476,439 in 1846 to 6,806,381 in 1882.

The French papers announce the death of M. Eugène Yung, for twenty-four years the director of the *Revue-Politique et Littéraire*, or *Revue Bleue*, as it is more generally known. He is succeeded by M. Henri Ferrari.

The *Débats* is publishing as its feuilleton an unpublished story of Capt. Mayne Reid's, called "Under the Mangroves."

—The second number of the *Woman's World* contains some interesting matter. There is an exceedingly forcible article by Mrs. Laura M'Laren on the causes which have contributed to a belief in the mental inferiority of women, ending with an appeal to the public for a suspension of judgment on that subject for one more century: if by the year 1988 the position of women in the artistic, musical, scientific, and literary worlds is not equal to that of the other sex, it will then be time to consider the question as settled against her. There is an interesting article by Mrs. Dinah Mulock Craik, which reached the editor only a few days before her death, in which the author maintains that it is monstrous that the country which produced Shakspere should be obliged to beg, borrow, or steal from other countries the dramatic element which it could find in itself if the play-going public would insist upon having plays of a higher order, and looks to Mary Anderson and Wilson Barrett to demonstrate that there is still a wholesome vitality in the British drama. It is doubtful, however, whether players of more force of character than either of these two are not needed to reform the stage. There is also a long fashion article. To a delicate taste, there is something unpleasant in seeing discussions of fashions mixed up with the most serious questions of life and art. Fashion papers doubtless serve a useful purpose—they are the means of diffusing a pleasing consciousness of being well dressed through hamlets and towns very remote from the centres where fashion has its origin; but they are not dignified mediums through which to address an audience of cultivated persons. In a book on cosmetics and tight-lacing and the care of the feet, a person of genuine refinement, let alone an ordinary sense of humor, does not communicate far-reaching theories of mental and moral development. Books and papers of this kind are to be read, if they are read at all, in the privacy of the dressing-room, and they cannot be exposed on the library table without some feeling of degradation. In view of this elementary principle of good taste, it is rather surprising to see that such women as Mrs. Fawcett, Mrs. Henry Sidgwick, Mrs. Marshall, Anna Swanwick, and Julia Wedgwood, have promised their coöperation to what is, in the first instance, a journal of fashion.

—We speak elsewhere of that extraordinary photographic record of phases of animal locomotion made by Mr. E. Muybridge, under the auspices of the University of Pennsylvania. It remains to state that the analysis of supposed simple movements into compound thus effected can be followed by a synthesis, with the aid of the zoetrope, and especially with the aid of the stereopticon. In other words, the galloping horse, the flying pigeon, the leaping gymnast, the wrestlers, etc., can all be shown upon a screen in their proper action, to the delight of any audience fortunate enough to be invited to such an entertainment. Now it is evident that if there could be established in any large city—as in connection with a literary or scientific institution—a permanent "battery" of cameras such as was employed by Mr. Muybridge, an imperishable record of the figure, height, dress, carriage, and gait of any eminent man in or visiting the gallery could be had. Posterity, at the bidding of our photographic necroman-

cers, could call up any of these worthies at any future date, and see him move across the stage with a startling verisimilitude. Nay, we could have his very "walk and conversation," and could read our Lowell's line in two ways, as

"—— one of Plutarch's men talked [walked] with us face to face."

The phonograph, at the same time, as we may anticipate from its ultimate perfection, might repeat audibly to the same audience a passage read aloud by the personage in question on occasion of sitting (or walking) for his portrait before the battery. A collection of such recitations would furnish invaluable examples of the speech of the cultivated at any given epoch.

—For some years *Nord und Süd* has made a practice of giving its readers well-written accounts of the most sensational criminal trials of the day in Berlin, Vienna, and other Continental cities, thus furnishing a sort of literary standing to persons and incidents that otherwise would enjoy only the momentary notoriety of the newspaper, and even then would be skipped by the cultivated reader. The Zalewski trial, however, which is discussed by F. Gross in the November number, has, if the commentator's hypothesis is correct, a certain intrinsic connection with literature. Zalewski was born in 1855, and at the age of eighteen got a place in a country post-office, where he forged money-orders, and was in consequence sentenced to six months' imprisonment. At the end of his term he was required to serve in the army, in which he stayed till 1885, when he got another place in the postal service, this time in Vienna. His previous offence would have prevented this, but the copy of the circular letter concerning it had been lost. After a short time he was assigned, at his request, to duty in the registered-letter office. On May 26, 1887, he succeeded in stealing $75,000. In the two years he had been in the Vienna Post-office his salary had been raised from $150 to $450 a year, and he had married. His plan for escape was as carefully thought out as was the intended robbery, yet, according to Mr. Gross, the whole affair was due less to the motives which govern common criminals than to ambition to be the hero of what we call a "dime" novel. The characters and incidents of the crime read as if copied from fiction, unless, indeed, fiction of this sort is truer to life than has been supposed. Zalewski's first object, of course, was to get into a position where there would be something to steal, and in this he seems to have found no difficulty. His second was to provide for his escape, and here his plans were equally successful. He assumed the existence of one of the stock characters of cheap fiction, the poor, but honest and refined woman, between youth and middle-age—the "white slave, who unites the appearance of a lady with the work of a servant." On the 22d of April he advertised to the effect that a well-to-do civil servant wished, as a wife, an educated and sensible woman, poverty no obstacle. Johanna Nathanson, teacher of music and languages, aged twenty-seven, answered the advertisement. To her Zalewski called himself the Ritter von Till, said he was pursued by his relatives, and persuaded her to change her lodging so that he could visit her without being seen. He also accustomed her to the idea, during the following month, that he might have to seek refuge from his pursuers with her. She was accordingly prepared to receive him when, on the night of the robbery, he appeared. She kept him in her lodging, where she lived without a servant, a month, during which the town was full of the hue and cry for Zalewski, and yet never suspected his identity with her "knight." "Why should she?" she replied to a question at the trial. "Was he not her fiancé?" The mind of this cultivated damsel must have been fed, one would think, upon very unrealistic literature to trust any lover so absolutely as this.

—Meantime Zalewski saw no one but his brother, who appears to have become an accessory after the fact. This brother, a sergeant in the army, lived on intimate terms with a maid-servant, who, at his request, got an emigrant's passport, whereupon Johanna and her maid (alias Zalewski) set out for Havre, whence he sailed for this country, and she returned to Vienna. While he was at sea, the police, through an indiscretion of the sergeant, came upon the trail, and telegraphed to New York for Zalewski's arrest, which was effected. Now comes the really extraordinary part of the business. The Austrian Consul reported that the extradition of Zalewski might be difficult, and the lawyers (who at once offered their services) could at any rate postpone it for months. But Zalewski offered voluntarily to return, saying he should personally lay his case before the Emperor. At the preliminary trial, however, he urged that he was a victim of morphine, and had committed his crime when in an irresponsible state. But, finding that this plea made no impression, he developed the plan of defence to which he adhered to the end, in spite of its manifold absurdities, and which has made the trial a *cause célèbre*. This was, that he had been the slave of a secret political society whose object was the disintegration of Austria in the interest of the Slavic nationalities. It was through the society that he had procured his place in the postal service, and that the authorities had overlooked his previous "irregularity"; and, finally, its threat of exposing him, and so causing his dismissal, was the sole cause of his reluctantly consenting to steal the money, which, of course, was intended for the society's treasury. The money taken, Zalewski had fully intended to pay it over, but the agents of the society failed to meet him at the time appointed, and, being now alarmed for his safety, he had fled to America. These alleged disclosures attracted much attention, in spite of the inconsistency, which was easily shown, between them and Zalewski's acts. If his story was mad, there certainly was method in it, and it appears that public opinion in German Austria is quite ready to believe in conspiracies and the like. Zalewski was, however, sentenced to eight years' imprisonment—his dupe, Johanna, being at the same time acquitted.

—The session of the French Academy of January 26 will be one of unusual interest. The election to fill the vacancies made by the deaths, in July and October last, of MM. Caro, Viel-Castel, and Cuvillier-Fleury, has been appointed for that day. The candidates are numerous, those of most importance being, for the seat of M. Caro, M. Paul Janet and the Count Othenin d'Haussonville; for that of M. de Viel-Castel, Admiral Jurien de la Gravière, the Marquis Melchior de Vogüé, and M. Rothan; for that of M. Cuvillier-Fleury, MM. J. J. Weiss and Jules Claretie. M. Régis Chantelauze is the only candidate at large of importance. The most eminent of all these is undoubtedly M. Paul Janet, and there would be a peculiar fitness in his selection as a successor to Caro, although the literary and philosophical qualities of the two writers are so dissimilar. As the Count Othenin d'Haussonville is a candidate for the same seat, however, it is possible that M. Janet's superior claims may be passed over, unless his competitor should change his candidature to the seat of M. Cuvillier-Fleury, for which none of the applicants are of superior merit. When M. Gréard was elected last year to fill the place of the Comte de Falloux, much indignation was expressed among the Orleanists, and very loudly by certain Orleanist papers, that M. d'Haussonville, who was also a candidate, should not have been successful. The present election can scarcely pass without his friends, personal and political, making an effort that will elect him to one of the three vacancies. The candidates for M. de Viel-Castel's seat are all good. Admiral Jurien de la Gravière is already a member of the Institute (Académie des Sciences), and is well known to readers of the *Revue des Deux Mondes* from his interesting papers, on the French marine during the early part of the century, which have been appearing recently in its pages, and also from earlier works on the marine of the ancients, of the fifteenth and sixteenth centuries, and especially for his accounts of his own early and later expeditions to the Orient, the Levant, the South Seas, and elsewhere. He is seventy-five years old, which is always an additional argument in favor of a candidate for the Academy. The Marquis (formerly Comte) Melchior de Vogüé is also a member of the Institute (Académie des Inscriptions et Belles-Lettres). He is an archæologist, and has written much about Syria and Palestine, where he has spent a good deal of time. He was Ambassador at Constantinople from 1871 to 1875, when he was transferred to Vienna, where he remained until after McMahon resigned the Presidency of the republic, in 1879, when he also resigned his position. Of late years he has published in the *Revue des Deux Mondes*, at long intervals, a series of very interesting papers on "Villars, diplomate," which he now signs simply "Vogüé." He is about fifty-eight years of age, and is not to be confounded with the Vicomte Eugène Melchior de Vogüé, the charming writer in the *Revue des Deux Mondes* upon Russia and Russian literature, who is a much younger man.

—The third candidate for the seat of M. de Viel-Castel, M. G. Rothan, is also a diplomatist, whose writings upon the foreign policy of France during the Second Empire give him very serious claims to the position. In the six volumes of these which have been published, the literary and personal value of the author adds to the interest of the fine and delicate observation and divination of the diplomatist, who, it has been well said, would have had only to change the tenses of the verbs in his despatches to convert them later into a history of the period, so exact were his previsions. As secretary and chargé-d'affaires of the French embassy at Berlin and elsewhere in Germany, Consul-General at Frankfort, and afterwards minister at some of the smaller courts, he was peculiarly well placed to unravel the intricacies of German policy during the years which paved the way for the Franco-Prussian war. More recently M. Rothan has written about the events and personages of what is now history, with the picturesque vigor and animation of a contemporary, and with a penetration which spares neither the Prussia nor the France of the past, and lays bare all the springs that set in motion the complications so disastrous to his own country. Both M. Rothan and M. de Vogüé, as well as M. Paul Janet, have the peculiar fitness to replace the Academician for whose seat they are candidates, which seems to be a great advantage in such a case, if not always a necessity, in the similarity of their previous careers and the direction of their literary labors.

—It is only eighteen months since Liszt died, at the age of seventy-six, and now the cable

announces the death, at Paris, of one of his greatest contemporaries and countrymen, Stephen Heller, who was born three years after Liszt (May 15, 1814), at Pesth. Like most great pianists, he was a youthful prodigy, and at the age of nine played with his teacher a concerto for two pianos in a Pesth theatre. In Vienna he appeared as pianist at the age of thirteen, and two years later undertook a concert tour through Germany. At Augsburg he made the acquaintance of a wealthy lady, who took him into her house as teacher for her children; and here his musical intelligence ripened rapidly. In 1838 he went to Paris, where he has remained ever since, esteemed as teacher and composer. But at first he had to struggle with poverty, and met with considerable opposition, owing to the novel form of his compositions and the fact that he made enemies with his critical pen. Heller's compositions afford a conspicuous illustration of the tendency of pianoforte music to abandon the artificial sonata form and seek expression in shorter and more natural forms. Oddly enough, Schumann, whose pianoforte works also illustrate this tendency, and who was one of the first to recognize Heller's genius, regrets that he should "squander his wealth in such small forms"; adding that "other, more economical composers would have made the germs of his studies suffice for entire concertos and sonatas." Had he done so, his works would have had less "future" than now seems in store for them, owing to their originality and abhorrence of triviality. Although Fétis was very wrong when he wrote that "Heller is, much more than Chopin, the modern poet of the pianoforte," Heller will rank as one of the greatest tone-poets who have made a specialty of the piano.

—By a treaty between Costa Rica and Nicaragua, signed at Guatemala December 24, 1886, it was agreed to submit to arbitration the disputes of those Governments over territorial limits, and the President of the United States was selected as arbitrator. He consented to act as such last July, and the claims and arguments of the two countries are now before him. The question is narrowed to a single point—the validity or nullity of the Treaty of April 15, 1858, which was supposed, at the time and for several years, to have been duly ratified, and to have put a happy end to an apparently interminable dissension. But the whole question was reopened seven years after by the claim, then first made by Nicaragua, that the treaty had not been properly ratified. The long and able argument against this conclusion, laid before President Cleveland by the Costa Rican Minister, reached us some days since in its English dress. It is now followed by a pamphlet bearing on the same controversy, by Señor Manuel M. de Peralta, a recognized historical authority, issued at Brussels under the title 'El Canal Interoceanico de Nicaragua y Costa Rica en 1620 y en 1887.' It contains the report on Central American affairs made by Diego de Mercado to Philip III. in 1620, involving, of course, important matter related to the early territorial divisions of the provinces, the report also of Thos. C. Reynolds of the Central and South American Commission of 1884, together with a long list of official documents bearing on the case. Señor Peralta does not put himself forward as an advocate for either party, though it is easy to see that he believes the treaty valid. It is worth noting that Mr. Bancroft, who handles the question with his customary thoroughness in his history of Central America, written before the agreement to arbitrate, is of the same opinion.

ANIMAL LOCOMOTION.

Animal Locomotion: An Electrico-photographic Investigation of Consecutive Phases of Animal Movements. By Eadweard Muybridge. Published under the auspices of the University of Pennsylvania.

THE result of years of labor and of large expenditure of money is at last laid before the public in this magnificent work. The result is one of which Mr. Muybridge and the University of Pennsylvania, as well as all those concerned either in the actual investigations or in the supply of funds for carrying them on, may well be proud, and the work should belong to every scientific and artistic institution in the country and in the world.

The words of the title must be taken in the widest sense. By far the greater number of plates are devoted to the human "animal," while the "locomotion" illustrated includes almost every action of which bones and muscles are capable. It is well known that Mr. Muybridge's investigations began in the attempt to demonstrate the falsity of some commonly accepted and traditional methods of depicting the gaits of the horse. To show how far his work has outgrown this narrow aim, it is only necessary to state that, out of the 781 plates he has now published, only 95 are devoted to the horse, and only 124 to other animals and to birds, while the other 562 are devoted to men, women, and children, nude, semi-nude, and draped, walking, running, dancing, getting up and lying down, wrestling, boxing, leaping, and playing at athletic games—in short, acting before our eyes the animal life of man.

Here we have the naked, absolute fact: here, for the first time, human eyes may see just how the human body moves in the performance of its functions, how backs bend and hips balance and muscles strain and swell. This is not art, but it is a mine of facts of nature that no artist can afford to neglect. How would Signorelli, that enthusiast of movement and anatomy, who drew his dead son naked, or Michael Angelo or Benvenuto, who thought the crupper "a beautiful bone," have revelled in such volumes as these! How splendid nature is! Here are dancing girls graceful enough to delight the soul of Raphael; athletes with heroic movement that would fire the spirit of Buonarotti; foreshortenings, and flowing contours to satisfy Tintoret; and all with the indisputable stamp of fact, painted for us by the same sun that illumined these glowing chests and cut sharp shadows under the edges of swelling muscles. Thus to see the natural man in his own motion under nature's light is a lesson to humanity of its own glory that the Puritan and the ascetic, the contemner of the nude and the ignorer of art, would do well to study.

For, any impression to the contrary notwithstanding, these plates are beautiful. There are certain phases of movement that seem awkward, certain transient moments when the limbs assume positions which none has ever seen and which strike the eye by their strangeness; but follow the whole action through its various phases, and you will find it free and noble; study the attitude at the culminating moment of an action, and you will find it superb. No one need copy the posture of some of these photographs, or imagine that because a phase of action is proved to exist it is therefore fit for immediate reproduction in art. This course, with regard to the author's photographs of the horse, has been taken by some unwise enthusiasts, and the result has been disagreeable, and has tended to throw ridicule upon all his researches. The use of these records of transient phases of motion is to show how the body passes from an earlier to a later phase, through what changes it passes from rest up to the culminating moment of action and back again to rest; and the artist's true method of study is to master the whole movement, and then to select for representation the one or two phases that most nearly convey the sense of this movement as a whole. He may even do well to throw away his photographs altogether, the action once understood, and express it by a pose not actually found in any one of them, but conveying better than any of them, taken separately, the total result of the series. For the end of art is not record but expression.

So studied, the most interesting revelation that the camera has given us is not, perhaps, that art has been occasionally wrong, but rather that it has been so generally right. In turning over these plates, one is constantly struck with the recurrence of attitudes made famous in immortal sculpture or painting. Here is John of Bologna's Mercury; here is a fragment from the Parthenon; here is a figure of Michael Angelo's or Raphael's or Tintoret's—until one is filled with wonder at the power of eye or brain that saw or divined actions and movements that have waited until now for proof of their verity. Even in the representation of the lower animals, always less carefully observed, this is true. The full-spread gallop of the horse in sporting prints is gone, but the dog has it; the canter of the horses of the Parthenon is true; and in the first equestrian statue modelled in modern times Donatello has rendered the walk with an accuracy unsurpassable. It is only the moderns and the weaklings that suffer. The Greeks and the great masters of the Renaissance saw truly and well.

There is not space, nor is there any need, to go into detail. Least has been done in the investigation of the flight of birds, where the difficulties were peculiarly great; what has been done shows the marvellous observative faculties of the Japanese, who have rendered bird-flight more truly than the artists of all other races. But the presentation of human and quadrupedal action is bewilderingly abundant and complete, and we cannot more fittingly conclude our review than by repeating our recommendation to all artistic and scientific bodies, and indeed to all private persons who can afford to do so, to subscribe at least for the one hundred plates that make up a "copy" of the work, and for as many more as they can compass the means for. Communications may be addressed to Mr. Eadweard Muybridge, in care of the University of Pennsylvania.

GEN. ORMSBY MITCHELL.—I.

Ormsby Macknight Mitchell, Astronomer and General. A biographical narrative, by his son, F. A. Mitchell. Crown 8vo, pp. viii, 392. Boston: Houghton, Mifflin & Co.

THE contrast between the smooth current of a life devoted to science and the turbulent crowding of important events into a brief period of war, is well typified by the fact that Gen. Mitchell's biographer finds it necessary to devote as much space to the eighteen months of his military service as to the narrative of the preceding fifty-two years of his father's career. Yet Ormsby Mitchell's life had not been an uneventful or an uninteresting one. It is an attractive story from his infancy onward; nay, before his birth, the migration of his parents with their family from Virginia across the mountains to the Ohio, their voyage upon a flatboat through the almost unbroken wilderness hundreds of miles, their adventures on the way and in trying to make a home in the Kentucky forest, the discouragement of an evident-

ly intelligent and (for the period) well-educated family at finding by experience how uncivilized the frontier life must be, the birth of the boy in these wild surroundings, the father's early death, and the widow's struggle to provide for her family—all make up a romance as picturesque as fiction, but more interesting, because our sympathies are more deeply stirred by the knowledge that this is the very truth which happened to a man whose fame is known to us all, and who has good claim to be remembered by his scientific labors and by his patriotic service as a soldier.

While he was yet a mere child, Mitchell's mother removed with her family to Lebanon, O., some forty miles north of Cincinnati; so that, as boy and man, he always reckoned himself an Ohioan. Poverty made it necessary for him to shorten his common-school education, and when, at thirteen, in family council, his being apprenticed to a trade was under discussion, he cut the knot and showed the stuff he was made of by declaring that he would relieve the family of both care and responsibility for him if they would consent. His belief was that he could find some employment through which and in which he could continue his education, for his intellectual ambition was already roused. He found a place where, as "boy in a store," he could earn his bread and learn something besides. A year or two passed, and he discovered that the United States educated military cadets at West Point, supporting them while they were learning to be officers in the army. With characteristic energy and confidence he applied to the Congressman of the district for the appointment, and succeeded in getting such backing that he won the prize. He graduated in the class of 1829, with Robert E. Lee and Joseph E. Johnston, with good standing, and was retained at the Academy for two years as Assistant Professor of Mathematics. This was an important extension of college life and work, and probably fixed his scientific tastes and determined his career. At its close he married a daughter of Judge Clark of Cornwall, a young widow at the time, whose influence while she lived was evidently a powerful counterpoise to his impetuosity of temper, and the tendency of his strong but somewhat erratic will towards those decisions in haste of which one proverbially repents at leisure.

The army life of a subaltern in the Florida swamps was not agreeable to him, and after a brief experience of it, he resigned and took his young family to Cincinnati. His knowledge as engineer and surveyor was the readiest capital in his struggle for a livelihood, and continued to be his main reliance for some years; but in 1836 he was made Professor of Mathematics and Civil Engineering in the Cincinnati College, then newly reorganized. The Professorship gave him but a small salary, and his theodolite had still to make up the deficiency of income.

In the winter of 1841-2 he was induced to deliver a popular lecture on the "Stability of the Solar System," and the interest he aroused proved that he had lecturing talents of a very high order. The one address was followed by a course of lectures on general astronomy, and the idea seized him to use the enthusiasm excited to gather means to build an observatory, and to mount in it a telescope equal to any then in existence. To appreciate the apparent Quixotism of the enterprise, it must be remembered that this was before the days of American observatories. When, nearly two years later, John Quincy Adams laid the corner-stone of Mitchell's Observatory at Cincinnati, he could still say in his address, "Look around you, fellow-citizens. Look from the St. John to the Sabine. Look from the Nevesink to the mouth of the Columbia, and you will find not one! not one! or if one, not of our erection, but from funds liberally poured out from the coffers of that motherland from whom our fathers have decreed an eternal separation."

Mitchell's plan was to raise the necessary funds by organizing a joint-stock association, with shares at twenty-five dollars, and, by the aid of his enthusiasm, he raised the money required by personally soliciting the subscriptions, which were obtained from more than three hundred persons. The twelve-inch refractor was bought of Merz in Munich, brought home and mounted, and now the work of the astronomer began. Before, he had been collector, builder, machinist, agent.

It would be too long a story to detail his labors, his vexations, his difficulties and discouragements. They are interestingly told in the biography by his son. To support the observatory, he was induced to make lecturing tours with astronomy as his topic, and he speedily became known as one of the most eloquent and attractive of lecturers upon science, at a time when the elder Silliman and our leading scientists were frequently occupying the popular platform. In 1860 he added the supervision of work at the Dudley Observatory to his other labors, and moved his family to Albany. Here he was when the civil war broke out. Secretary Chase and Senator Harris of New York procured for him the offer of a commission as Brigadier-General of Volunteers in August, 1861, which he accepted. But before he could take the field, and while on a preliminary visit to Washington to report for orders, his wife, who had been in feeble health for some time, suddenly died. The great grief was much more than personal sorrow and pain. It was the loss of a complementary part of his own organization—a balance-wheel of his own restless energy—a calming and steadying influence necessary to make his efforts count as, with his intellect and force, they ought to do. His son says that "her absence is as plain in the narrative that follows as her presence has been in all that precedes."

Gen. Mitchell's military career was a great disappointment to him and to those who were close to him. He was still in full physical vigor, though older than most of the general officers in the national army. His early military education, added to his intellectual eminence as a man of science, gave promise that he would be a leading figure in the conduct of the war. There was no apparent reason why he might not be as prominent on the side of the Union as his classmates Johnston and Lee were on the side of the rebellion. He started a little later in the race than McDowell, McClellan, Halleck, and Buell, and therefore had to begin with subordinate commands; but his chances of eminence were as good as Grant's, or Sherman's, or Thomas's, or Sheridan's. The filial piety of his son attributes his disappointment, and indirectly his death, to the jealousy and dislike of others, especially of Halleck and impliedly of McClellan. The narrative makes it plain that Mitchell was highly esteemed and greatly liked by Stanton and Chase—he may be said to have been a favorite with them. With the Secretaries of War and of the Treasury for his friends, the command of an army seems almost a thing of course. How came he to fail of it, and to be banished to the coast islands of South Carolina, where he soon fell a victim to the climate? The lesson of his previous career is full of encouragement for every generous-minded youth, and shows triumph after triumph in his progress from poverty without education towards competence and acknowledged scientific eminence. Useful and pleasing as this lesson is, that which is taught by his career on the field of great events, in a time that must always fill a great page in history, seems more important by reason of this connection. More than this, his career in the army did not affect himself alone. It will be seen that it was in no small measure connected with the removal of Gen. Buell from active service, and in this way affected the whole course of events in subsequent campaigns in Kentucky and Tennessee. As an historical study, therefore, it is of very considerable importance, and worthy of sufficient space, at least, to outline it with distinctness.

Mitchell and McClellan were not only living in Cincinnati at or a little before the beginning of the war, but both had been connected with the Ohio and Mississippi Railroad. Mitchell had run the first lines of survey for the road, and had been consulting engineer, while McClellan went directly from its management to the organization of the Ohio troops. Each knew the reputation of the other at home. When Mitchell reported to McClellan for orders, the latter was desirous of making use of all the officers he could reach who had military education and training. He made no secret of his distrust of general officers appointed from civil life without such preparation. Mitchell, in reporting to him, reminded him that he (McClellan) was a much younger man than himself, but promised, nevertheless, his hearty and unqualified support. Yet McClellan received the assurance without cordiality, and Mitchell felt the disappointment. It is possible that he was a little maladroit in this reference to his own superior age, for to graduates of West Point it might imply a consciousness of military seniority; but it would probably be near the truth to assume that McClellan thought, from Mitchell's reputation for self-confidence and habit of pushing strongly his own ideas, that it would be precisely in cordial subordination he would be lacking; and the intimation that he was waiving the privileges of superior age would not tend to diminish this fear. One might guess, without much danger of being wrong, that McClellan a little later warned Buell that this would be Mitchell's failing, and that Buell's mention in his letter of November 27 that he found him "subordinate" is not accidental.

At the suggestion of Gov. Dennison, and in view of the anxiety at Cincinnati lest the Confederate force under Zollicoffer might advance upon that city, a department was made, consisting of the State of Ohio, and Mitchell was assigned to it, with headquarters at his old home. This was in September, when Gen. Robert Anderson was in command of the Department of the Cumberland, including Kentucky and Tennessee. For the proper defence of Cincinnati, Mitchell found it desirable to make fortifications on the Kentucky side of the Ohio River, in the suburbs of the city of Covington; but as this was in Anderson's department, the boundaries of the Department of the Ohio were made to include so much of Kentucky as would be included by a radius of fifteen miles. Mitchell applied himself with energy to the organization of volunteers, but was discontented with a rôle of organization and defence. He was not sparing in his criticisms of Anderson, nor hesitating in assuming responsibility within Anderson's department.

On the 8th of October Anderson relinquished his command to Gen. Sherman, and on the 10th Mitchell was put under Sherman's command, with a special order from the War Department assigning him to duty at Camp Dick Robinson, in central Kentucky, to prepare the troops

there for an expected movement upon Cumberland Gap, and ultimately into East Tennessee. This arrangement was made at Mitchell's request, or, as he says, on his own "appeal to the Secretary of War." He had organized and sent forward the troops that were at the camp named, and was burning to lead them in the field. But the order made complications. It was not showing proper consideration to Sherman to assign subordinates to special tasks under him. As the responsibility was his, the selection should be his. Again, Gen. George H. Thomas was in command at Camp Dick Robinson, and to put Mitchell in command of his troops was to supersede him, against which he protested. The effort, therefore, to make a particular field command for Mitchell resulted, as should have been foreseen, in embroiling everything, and in at once putting him in false relations to both Sherman and Thomas. Sherman showed admirable temper and tact in his correspondence at this period, and protected Thomas in his rights without offending Mitchell. He put plainly before Secretary Cameron, in the famous interview which occurred on October 16, the magnitude of the task in the West, but in his letters to his subordinates his tone was cheerful, his words were encouraging, and he put the best face on everything. His official correspondence is the best possible answer to the insinuations, then circulated, that his intellect was unsettled.

Gen. Buell assumed command on November 15, and pushed forward the work of organizing the Army of the Cumberland. His department was enlarged so as to include Mitchell's. The authorities at Washington still urged the East Tennessee movement, but Buell, like Sherman, doubted the possibility of supplying an army in that region by wagon trains from central Kentucky, a distance of two hundred miles. The almost starvation of Burnside's command in the winter of 1863-4 showed how well founded was that opinion. Mitchell had tendered his resignation when he failed to get the command of the troops under Thomas; but his friends saw that he had acted unwisely, and interposed to prevent its acceptance. Buell assigned him to the command of a division in front of Louisville, where he would be in the advance when the movement on Nashville should begin, and showed such regard for him and such respect for his opinions that the irritation subsided, and Mitchell awaited the new campaign with some approach to patience.

THE CENTRAL-EUROPEAN REVOLUTIONS OF 1848-49.—I.

The Revolutionary Movement of 1848-49 in Italy, Austria-Hungary, and Germany. With some Examination of the Previous Thirty-three Years. By C. Edmund Maurice, author of 'The Lives of English Popular Leaders in the Middle Ages.' London: George Bell & Sons; New York: G. P. Putnam's Sons. 1887.

COMPREHENSIVE and elaborate works by English writers on the modern history of Continental Europe are exceedingly rare. Coxe's 'History of the House of Austria,' composed in the beginning of this century, is still one of the best specimens, though eclipsed by Carlyle's powerful delineations of the life and deeds of an arch-enemy of that house, Frederick the Great. A very imperfect continuation of Coxe's history, embracing a partisan sketch of the events of 1848, was published, as its fourth volume, in Bohn's collection. The work before us, which barely in a few sketches transcends the sphere within which the power and armies of the House of Hapsburg were active forty years ago—being mainly devoted to movements in which the centres of the various races of Austria, Vienna, Pesth, Milan and Venice, Prague, Lemberg, Agram, Carlowitz, and Hermanstadt, were in a national ferment under democratic leaders, and the Austrian generals, Radetzky, Windischgrätz, Haynau, Welden, and others, wielded the sword of the Hapsburg dynasty—also attaches itself to Coxe's volumes; but it is totally different in character, and inspired by a different interest. It is, in fact, an anti-Austrian history. The author obviously went into the study of his subject with a strong antipathy against the dynasty and the bureaucratic centralization enthroned in Vienna, which, while Metternich managed their affairs, formed the most persistent and consistent, most inveterate and deleterious, power opposed to the freedom and liberal aspirations of the Continent, and a constant negation of the unity of Germany and Italy, of the independence of Hungary and Poland, of the national autonomy of Czech and Croat.

The genesis of this remarkable book—a work of love and conscientious labor—is clear. With the enthusiasm for freedom and patriotic action which the atmosphere in the domestic circle of his father, the famous "Christian Socialist," was sure to breed, the author listened as a boy to the then fresh accounts of the popular risings and combats which, in 1848-49, drove Louis Philippe from the Tuileries, Metternich from Vienna, Radetzky from Milan, Pálffy from Venice, Jellachich from before Buda, Russian invaders from Transylvania, Windischgrätz from Pesth. He knew many of the representatives of the *victa causa* as exiles in England—among them Mazzini, Garibaldi, and Saffi; Kossuth, Klapka, and Pulszky; Karl Marx, Karl Blind, and Eugen Oswald. He read, or heard from eye-witnesses, how bravely others had met death under the banners of Bem, Görgei, or Mieroslawski, on barricades, battlefields, or gallows. The story of those popular struggles became a sacred lay to him. At a riper age he learned to his grief that the cause of the peoples had not succumbed to the cannon and perfidy of the tyrants alone; that mutual jealousies and hatreds, national and provincial, and conflicting ambitions and schemes had a large share in its downfall. Prussian and Pole, Czech and Austrian, Croat and Magyar, Ruman and Szekler, had fatally struggled with each other; Venice had not acted in harmony with Milan, nor Naples with Palermo, nor Florence with Rome; the parliaments of Frankfort, Berlin, and Vienna had neutralized each other's constituent work; Kossuth was accused of presumptuous leadership, Mazzini of uncompromising republican dogmatism, Garibaldi of military rashness, Görgei of treason. Perplexed by contradictions and doubts, Mr. Maurice devoted years of labor to an impartial study of the revolutionary epoch, reading, travelling, and inquiring, though leaving out France, where the struggle had not been waged against oppression or alien rule, but between political systems and classes of the nation. The main result of these studies, as to the intrinsic merits of the general movement, is summed up thus, at the conclusion of the book:

"Those revolutions had displayed, in a way unknown before, the strength and the weakness of the national principle. The enthusiasm for liberty, and the power of generous self-sacrifice, which was kindled by a feeling for a common language and common traditions, had been shown in each of the Revolutions; and they had struck a blow at the merely diplomatic and military settlements of States which produced a lasting effect. But, on the other hand, with the love for men of the same race and language there awoke in all the nations, with terrible force, the hatred and scorn for men of other races and languages; and thus, while the leaders of the movement taught tyrants their danger, they supplied them at the same time with a defence against that danger—with another justification of the old maxim of tyrants, 'Divide et impera.' And so the work of the Revolutionists did not fail; but yet it could not achieve all the noble ends for which it was intended."

A last paragraph then tells us how the movement was to be resumed a decade or thereabouts later; how the work, "ennobled by the thought of Mazzini" and the action of Garibaldi and Manin, was to be completed "by the intrigues of Cavour" and Louis Napoleon; how, as Germany had failed to absorb Prussia, Prussia was to absorb Germany by Bismarck's "stern, hard policy of 'blood and iron'"; how the effects of the blunders of the Vienna Revolution were to be remedied by the less generous blundering of Schmerling; how Francis Deák, who had wisely stood aloof in 1849, was to revindicate for Hungary the freedom which she had lost for a time; how other national solutions were to be postponed, and "the yet more dangerous problems of Socialism . . . gradually to assume even greater prominence in the affairs of Europe." From all of which "it will be seen that the Revolutions of 1848 to 1849 were but the climax of movements of which we have not yet seen the end." This summing up clearly shows that the author's democratic ardor has not cooled off, though it may have been softened by his investigations; and that his sympathies still all lean to the side of "the people" and their leaders, even when he contrasts their doings with the achievements of such ministerial wielders of royal power as Cavour and Bismarck. This constancy of sentiment becomes the more striking when we consider how deeply and unsparingly he went into the examination of the chaos created by the dissensions and contentions of the revolutionary actors. A situation or two, reproduced by condensation from his pages, may serve to illustrate this. Let us take one from the theatre of action in Italy, which he has studied best of all.

We are in the early spring of 1848. Charles Albert had been victorious over the Austrians at Goito. Lombardy was full of enthusiasm for the King. On the day after the battle Mazzini appeared in Milan. He addressed the people from a balcony, praising the Provisional Government. But when he applied to the latter for military positions for his republican friends, their services were refused. Volunteers from Switzerland were in the same way repelled. Garibaldi, arriving in the full splendor of fame earned with the sword in South America, was told at Charles Albert's camp that he might go to Turin, "to see *if* and *how* he could be employed." Many of those who were thus repelled in Lombardy went to Venice, which, under the lead of Manin, had achieved a purely democratic revolution. But anxious as Manin was to enlist all sympathies, "he could not help being a Venetian" in the narrower sense, and Venice lost time in making common cause with Venetia. Treviso, Padua, Vicenza, and other Venetian towns had formed Provisional Governments even before they knew that Venice was free, but, disappointed by the hesitation of the Republic, Vicenza offered herself to the King of Sardinia. This decision excited indignation in Venice. The trouble was aggravated by the anomalous position of the officers of the Papal troops, marching to the aid of northern Italy. Durando, the general in chief, deemed himself an independent commander, owing to Pius IX.'s public discouragement of the advance. Though willing to fight for Venice, he felt it was safer to take orders from an established sovereign; and while he wished

to relieve Padua, he meant to do it as an officer of the Sardinian King. But the wavering of Charles Albert "between war, diplomacy, and complete abandonment of the cause" made him hesitate about extending his campaigns to Venetia. He forbade Durando to cross the Po, and sent him instead to protect the Duchies of Modena and Parma. At the end of April, the Pope launched an Encyclical by which he absolutely repudiated the war against Austria. At the same time he was pressed by Ferdinand of Naples to promote a league between Rome, Naples, and Tuscany, which was to counteract the power of Piedmont. "To say the truth, Ferdinand was not without excuse in this matter; for, while he was being driven to declare war on Austria, the Sicilian Assembly were deposing him from the throne of Sicily, and discussing a proposal to offer their island to a son of Charles Albert." Terrible indignation was aroused by the Encyclical. The cry of treason was raised against the Cardinals, and some of the patriots even talked of carrying off Pius to Lombardy, that he might see for himself the real condition of the war. Both Pius and Charles Albert reconsidered their action, and Durando entered Venetia, but was soon hard pressed, and abandoned by the King. Mazzini in Milan in vain agitated for more revolutionary action. Inscriptions on the walls, emanating from partisans of Sardinia, threatened him with death. This is one short act of the Italian drama—and the whole of it was like it. What was in the meanwhile going on in Germany?

"The fiery Republicans of Baden had returned in indignation to their State, when they found that the Preparatory Parliament would neither establish a Republic nor declare itself permanent; and, provoked by the arrest of one of their members, they had rushed into open insurrection, which only the influence of Robert Blum had prevented from spreading into the Rhine Province. And, while they were preparing to suppress the Republican opposition, the Frankfort Parliament were startled to hear that an assembly had met in Berlin which claimed, like them, to be a National Constituent Assembly; and this rivalry was made the more alarming by the assistance which Prussian soldiers were at the time giving to the Grand Duke of Hesse-Darmstadt in suppressing a popular movement in Mainz. The Frankfort Parliament indignantly resolved that 'This Assembly of the Empire has alone the power, as the one legal organ of the will of the German people, to settle the Constitution of Germany, and to decide about the future position of the Princes in the State.' And they further resolved that every Prince who would not submit to their decisions 'should be deprived, with his family, of the princely rank, and should descend into the class of citizens, and that his crown and family property should become the property of the State.'"

Add to this fragmentary picture turbulent movements in every German capital, the national conflict in Schleswig-Holstein, and the deadlier one in Posen.

Tuscan Studies and Sketches. By Leader Scott. Illustrated. Scribner & Welford. 1887.

THE author of this handsome volume is a lover of Italy, who has tempered delight in scenery and costumes with some not too learned investigations in the history of the arts. The two topics are divided by a clear line. The earlier portion of the book contains the story of the Giants of the Palazzo Vecchio, the David, the Hercules and Cacus, and the Neptune, and gathers together some interesting information about Italian organ building, the tapestry industry, and the Florentine mosaic work; at the close we are reminded on what grounds the similar mosaic ornamentation at Agra and Delhi has been ascribed to the influence of artists sent to India in search of Oriental agates and gems for the Medici chapel about 1608, if, in fact, the Orpheus at Delhi be not their own work or that of other Florentine workmen. An artistic episode is made of the beautiful bride-room of Margherita Borgherini, which employed the skill of Baccio d'Agnolo, Andrea del Sarto, Granacci, Pontormo, and Bachiacca; and occasion is taken from the recovered fresco of Sodoma at Mount Oliveto to pay homage to that powerful painter, in whom so many strains of the Italian genius met, and to defend him against the aspersions of Vasari. The latter had but a poor opinion of him, called him a spendthrift, and made other ungentle remarks about him, even saying that his wife had to leave him and support herself, while he was despised by every one; for all this no evidence is found, but only rebutting testimony. The Medici library has a chapter to itself; and these are all of the "Studies"—a well-selected list, pleasantly treated.

The second and longer portion is made up of sketches of Italian life—the vintage at the old villa of the Benvenuti, where the Countess gave a "garden-party," as we should call it; the funerals and the stage-plays in the Apennine villages; the peasant women selling the great crop of mushrooms (three thousand pounds a day at Piteglio, at four and a half centesimi the pound); the gay life at the baths, with all those Italian children who are never young in their apparel even at the seashore; the Florentine market, gone now, and the annual procession of the people to the cemetery at San Miniato. Abundance of Italian color and realism, and a sense of great pleasure in observing it, make all these attractive. Of greater interest, however, are the last two papers, which narrate a journey to Volterra and San Gemignano. The latter is getting to be a hackneyed subject now; but Volterra is fresh, and antiquity has there one of its most impressive seats. The Etruscan city is not too remote, nevertheless, from the modern world. Hard by are the borax springs of Count Larderel, which produce £240 worth of boracic acid daily, and the proprietor, it is interesting to learn, has set up excellent schools, "the infants', the boys', the girls', the adults' night-school—all in such exquisite order and keeping that they would win a premium from an English school board." There is, besides, a spinning and weaving school for young unmarried women; the Count provides the wool and cotton, and the products are sold for the profit of the workers. The salt-works of San Leopoldo, from which the Italian Government obtains an annual revenue of £130,000, are also in the neighborhood. Volterra itself, as the centre of the Etruscan power, is filled with relics; the country about has the picturesque characteristics of a volcanic region, and lying, as it does, off the regular routes of travel, it is full of interest. The volume, as a whole, realizes its very modest aims.

A History of Photography; Written as a practical guide and an introduction to its latest developments. By W. Jerome Harrison, F.R.S. Scovill Manufacturing Company. 1887.

THOUGH foreshadowed as long ago as 1777, the practical question of how to preserve the light-record from destruction by the agent which produced it was not solved till 1839, and, as applied to the present form of photography, not until ten years later. Since then, progress in discovery has been rapid, and of the various stages Mr. Harrison has omitted to notice none. Every form of production of fixed images by the action of light has passed under his careful scrutiny, and, condensed though it be, his history, so far as our own memory goes, overlooks nothing. Of scientific photography, as in astronomy, he has made no account.

In treating of photography in colors Mr. Harrison shows himself to belong to the category of dreamers. He asks, "When will the Niepce, the Talbot, or the Herschell arise who will do for colors what these 'fathers of photography' did for pictures in black and white?" Without being rash enough to put a limit on the progress of science, it is pretty safe to reply, "Never, until some new property of matter is discovered." The fact is, that all the apparent renderings of natural colors by the photograph are, thus far, fallacious coincidences, and no one has ever succeeded in getting in the camera a true reproduction of the colors of natural objects. It is unquestionable that chloride of silver, exposed to light under certain conditions, decomposes in an iridescence which to a limited extent coincides with certain colors of the prism, so that when a chloride film is exposed under colored glasses, the decomposition it undergoes partially reproduces, at a certain stage of the decomposition, the colors of some of the glasses; but the continued action of the light ends in monochrome. Mr. Harrison says that "with regard to natural colors we are now precisely in the condition occupied by Davy and Wedgwood with respect to ordinary photographs." But this is not the case. There is nothing to show that the colors of the natural object are the cause of the colors even in the decomposing chloride. We have seen a blue sky produced in a wet collodion negative, but it was clearly an accident of the molecular constitution of the vehicle for the silver reduced by development, and was only visible by reflected light. But the colors on daguerreotype plates, which have given the most marked results, may be produced, as Becquerel shows, without the action of light. Placing a silver plate in a "solution of hydrochloric acid," and attaching it to the positive pole of a voltaic battery, etc., etc., "as the combination of silver and chlorine took place, the layer of silver chloride increased in thickness, and as it did so its color changed to gray, yellow, violet, and blue; and, continuing the action, these colors appeared a second time." And no more is done in the decomposition of those films by light than is thus shown to have been done in the forming of them by electric action; and in every case thus far, as stated by any trustworthy scientist, the images, while never coinciding completely with nature, disappear under the continued action of light. We have seen some of the results of the experiments made, and while a part were certainly curious coincidences, others were deliberate fraud.

A frontispiece portrait of the author of this book by the "Mosstype" is a very successful print from the block derived from a photographic negative. Another print of three children, at the end of the volume, by the same process, suggests the need of a sure means of correcting defects in the block, the want of which is a great drawback still to all the block processes.

Studies in Civil Government. By W. A. Mowry. Boston: Silver, Rogers & Co.

THERE is no more gratifying evidence of the increasing attention given to the study of American history and institutions than the steady improvement in the quality of the manuals. There are already several excellent narrative

school histories; and Mr. Mowry adds one to the brief list of serviceable descriptive text-books. The civil Government which he has in mind is, to be sure, that of the United States only, but he treats of the local as well as of the general Government. The book is therefore a compromise between a description of institutions, like Nordhoff's, and an elementary commentary on the Constitution, like Andrews's or Townsend's. None of the topics which he has selected for treatment are uninteresting, and most of them are essential for the future citizen to know. Among the best things are the chapters on public schools and local taxation, and the brief descriptions of the post-office, the national banks, and other public institutions. The spirit of the book is to teach government as it is. In its neat exterior, clear type, convenient table of contents and index, and simple arrangement, it is almost a model. Mr. Mowry has had the happy idea of illustrating his book with tolerable pictures of the Capitol at Washington, and other public buildings, and with still more suggestive plans of the House and Senate chambers.

The chief fault of execution is a want of proportion, which has led to the total omission of some topics that must not be left untaught. If four pages can be given to copyright, there surely should be space for some account of State governments. It is well to give a chapter to territorial growth, but it should not take the place of a sketch of the civil status of the various classes of the people. If Mr. Mowry had contented himself without the constitutional texts, which take up one-fifth of the book; or if he had printed the Constitution of the United States only once, instead of in considerable part twice, he might have found room for some account of political parties and political methods. The comments on the clauses of the Constitution in many cases add nothing, and in other cases are phrased in technical terms. It is, however, a book in the right direction, and likely to be interesting and useful, in the hands of an intelligent teacher.

De Omnibus Rebus: An Old Man's Discursive Ramblings on the Road of Every Day Life. By the author of 'Flemish Interiors.' With one hundred illustrations by H. Caulfield Orpen. London: John C. Nimmo. 1888.

THIS volume makes no demands upon the reader except for leisure. The "road of every-day life" which its author journeys upon is the route of the London omnibus. Incidents of the way and odd characters or caricatures are the theme to which he returns from time to time, but his discursiveness is the rambling of a man who is trying to make talk, and bears the same relation to thought that gossip does to conversation. He is hard put to it to find something to say, and he pieces out with such ancient witticisms as he can remember. There can be but few books in which it takes so many words to say so little. There is enough material for one good Roundabout Paper, but it would be a short one. The relief to the reader who suffers the tedious diffuseness of these hundreds of octavo pages about the conductor, the driver, the fares, and the nothings which they suggest for mention, consists in the little illustrations by Mr. Orpen, which have the spirit of humor in them; these tell their own story, and the book can practically be perused by a man in search of amusement, by merely turning the leaves and glancing at these pictorial Britons, who exhibit themselves in attitudes and expressions which convey their whole character. The text adds nothing to their vigor or piquancy. They are, of course, slight sketches, scratches of the pencil, such as any one may see in the minor illustrations of the comic press, but entirely successful in their humble effort. There is a curious incongruity between their pettiness and the author's voluminous lucubrations. It is Harlequin mounted on the shoulders of gigantic Dulness. Nevertheless, if one has great abundance of leisure, he may take pleasure in the London atmosphere which pervades the book. The Londoner is present in every scene; and in every turn of the author's style, in his interests, his haunts, his prejudices, and all that is his, the citizen of the British metropolis stands confessed.

Women and Men. By Thomas Wentworth Higginson. Harper & Brothers. 1888. 12mo, pp. 326.

MR. HIGGINSON has reprinted in book form the series of articles, chiefly on women and incidentally on men, which have already appeared in *Harper's Bazar*. They discuss, with great good sense and judgment, the changes in the condition of women produced by the extinction of her home-sheltered occupations of spinning and weaving, and by the coincident extinction of that profound ignorance which was once thought essential to modesty. The curious slowness with which many people—aged and conservative people of both sexes—recognize the changes in character and career which are necessarily produced by such great changes in circumstances, will cause articles of this sort to serve an important function, doubtless, for many years to come; but to one who has a keener vision for the signs of the times, they have already a somewhat antiquated air. It is only the slow-of-going and the hard-of-seeing who have still to be convinced that a good education is not wasted when spent upon a woman, and that she can tie her bonnet-strings with modesty and virtue as she passes down the elevator and out of the door of some mammoth manufacturing establishment. Of the various causes, however, which have hastened in this country the complete recognition of woman's right to an independent existence, not the least important, perhaps, is the steady stream of sound and careful argument which, from the early days of the *Una* to the present time, has poured from Mr. Higginson's pen. No one is more deserving than he of the warm feeling which the victims of a resisted oppression must have for their tried and true knight-errant.

Of the articles which do not concern women, the best is that on the novelists of the Howells school. It is an admirable defence of the position that because commonplace characters are capable of being accurately painted, it does not follow that a writer of sufficient genius cannot make as fine a picture of characters that are not commonplace.

The publishers have done a graceful writer a great unkindness by giving a very inartistic exterior to his book.

BOOKS OF THE WEEK.

Abbott and Mathewson. Demosthenes Against Philip. Vol. I. Part 1. Macmillan & Co. 75 cents.
Baker, A. M. How to Succeed as a Stenographer or a Typewriter. Fowler & Wells Co. 25 cents.
Clodfelter, N. J. Snatched from the Poorhouse. Philadelphia: T. B. Peterson & Bros. 50 cents.
Connolly, D. The Household Library of Ireland's Poets. With a Full and Choice Selection from the Irish-American Poets. Daniel Connolly.
Currier, Prof. A. H. The Life of Constans L. Goodell, D.D. Introduction by Dr. W. M. Taylor. A. D. F. Randolph & Co. $1.50.
Dabney, Prof. R. L. The Sensualistic Philosophy of the Nineteenth Century Considered. New and enlarged ed. A. D. F. Randolph & Co. $2.50.
Daryl, P. Ireland's Disease: Notes and Impressions. George Routledge & Sons. $1.25.
Hodder, E. The Life of Samuel Morley. A. D. F. Randolph & Co. $3.
Johnston, R. M. Mr. Absalom Billingslea, and Other Georgia Folk. Illustrated. Harper & Bros.
Lea, H. C. A History of the Inquisition of the Middle Ages. In 3 Vols. Vol. II. Harper & Bros.

FOR SALE.—COMPLETE SET *Magazine of American History* in fine binding. Address A. S. CLARK, 34 Park Row, New York city.

Scribner & Welford's

NEW BOOKS.

The Bastille.

By Captain the HON. D. BINGHAM.

Author of 'The Letters and Despatches of the First Napoleon." Illustrated with numerous portraits, views, etc., etc. 2 vols., demy 8vo, cloth, $8.

General Contents: The Building of the Bastille—The Archives—Regulations—The Prisoners—The Governors—Charles VI.—Louis XI.—Henri IV.—Marie de Medicis—Louis XIII.—The Fronde—Louis XIV.—Richelieu—Closing Scenes—Louis XVI.—The Demolition, etc., etc.

English Newspapers:

Chapters in the History of Journalism. By H. R. Fox Bourne. 2 vols., demy 8vo, cloth extra, $10.00.

"Mr. Fox Bourne's design is a useful one, in the execution of which he has had the advantage of a field almost unoccupied. . . . Nothing like a serious attempt to trace the growth of the British newspaper was ever made till Mr. Fox Bourne came into the field sufficiently well equipped for the task. He is not lacking in enthusiasm or in industry; he has a sufficient consciousness of the power of the institution of which he writes; he has had more than twenty years' experience of journalism."—*St. James's Gazette.*

COMPLETE IN ONE MAGNIFICENT VOLUME.

In an extremely handsome and appropriate cloth binding. Price $10.00.

John Leech's Pictures of Life and Character.

From the collection of "Mr. Punch." Containing nearly 900 pages of pictures.

"The genius of Leech has never been seen to greater advantage than in this gallery."—*Morning Post.*

"We doubt whether, in the whole range of the literary or pictorial art of the period, the earlier portion of the Victorian era has been elsewhere so vigorously, so truthfully, as well as so humorously portrayed as in John Leech's inimitable pictures. The series has an importance beyond the amusement of the moment—it serves both to commemorate the genius of the artist and the character of the age."—*County Gentleman.*

Hand-Book of Republican Institutions in the United States of America.

Based upon Federal and State Laws, and other Reliable Sources of Information. By Dugald J. Bannatyne, Scotch Solicitor, New York; Member of the Faculty of Procurators, Glasgow, Scotland. Crown 8vo, cloth, $3.00.

"I would like to assist my countrymen (English, Irish, and Scotch) in an effort to overcome the deadweight 'ignorance,' and now spread before them a banquet of Republican Institutions in the United States of America. It will doubtless seem dry and repulsive to the thoughtless, while the sensible will remember that it took a long time of constant application to learn to read, to write, to sum; and that the battle of life is one to the death, and requires tools of the keenest edge. 'Read, mark, learn, and inwardly digest,' are what I would advise."—*From Preface.*

COMPLETION OF MR. KINGLAKE'S HISTORY.

The Invasion of the Crimea.

ITS ORIGIN, AND AN ACCOUNT OF ITS PROGRESS DOWN TO THE DEATH OF LORD RAGLAN. By A. W. KINGLAKE.

VOL. VII.—FROM THE MORROW OF INKERMAN TO THE FALL OF CANROBERT.
VOL. VIII.—FROM THE OPENING OF PÉLISSIER'S COMMAND TO THE DEATH OF LORD RAGLAN.

Illustrated with numerous Maps, Plans, and Index to the complete Work. Demy 8vo, cloth, $11.20.

"The respectable and sometimes excellent translations of Bohn's Library have done for Literature what railroads have done for internal intercourse."—R. W. Emerson.

"I may say in regard to all manner of books, Bohn's Publication Series is the usefullest thing I know."—Thomas Carlyle.

"An important body of cheap literature for which every living worker in this country who draws strength from the past has reason to be grateful."—Professor Henry Morley.

"The publishers are making constant additions of an eminently acceptable character, to 'Bohn's Libraries.'"—Athenæum.

Bohn's Libraries.

CONTAINING

STANDARD WORKS of EUROPEAN LITERATURE in the ENGLISH LANGUAGE,

With Dictionaries and other Books of Reference,

Comprising in all Translations from the French, German, Italian, Spanish, Scandinavian, Anglo-Saxon, Latin and Greek.

700 Volumes, $1.40 or $2 each, with exceptions.

RECENT ADDITIONS.

VICTOR HUGO'S DRAMATIC WORKS. HERNANI—RUY BLAS—THE KING'S DIVERSION. Translated by Mrs. Newton Crosland and F. L. Slous. $1.40.

THE LETTERS AND WORKS OF LADY MARY WORTLEY MONTAGU. Edited by her great-grandson, Lord Wharncliffe; with additions and corrections derived from Original MSS., Illustrative Notes, and a Memoir by W. Moy Thomas. New Edition, Revised, in Two Vols., with Portraits. $4.

"A most convenient reprint of Mr. Moy Thomas's admirable edition."—*Athenæum.*

AN EGYPTIAN PRINCESS. An Historical Novel. By Georg Ebers. Translated by Emma S. Buchheim. $1.40.

"The translator's rendering is easy and elegant."—*Morning Post.*

SPINOZA'S CHIEF WORKS. Translated. 2 vols. $4.
STAUNTON'S CHESS HANDBOOK. $2.

*** The above books sent upon receipt of advertised price. Catalogues of our regular stock will be mailed, if desired, to those interested. New Catalogue of Choice and Rare Books nearly ready.*

SCRIBNER & WELFORD, 743–745 BROADWAY, N. Y.

Ready on Saturday:

James Anthony Froude's

NEW WORK:

The English in the West Indies.

Or, The Bow of Ulysses. With eight full-page illustrations from drawings by the author. Crown 8vo, $1.75.

In this volume Mr. Froude continues the studies, which he began in his 'Oceana,' of the relations of England to her colonies, written in the graceful, fluent, and lucid style of which Mr. Froude is the master. The work is especially notable for its succession of graphic pictures of the people of the West Indies and their present condition of life, the whole forming a narrative replete with suggestive thoughts, and entertaining to an unusual degree.

*** *OCEANA.* A New Edition, uniform with the above. Crown 8vo, $1.75.

Triumphant Democracy:

Or, Fifty Years' March of the Republic. By Andrew Carnegie. New and Cheaper Edition. Eighth Edition. Cloth, $1.50; paper, 50 cents.

Seven editions of this popular book having been exhausted, the eighth is issued in a new and cheaper form, with editions, uniform in price and style, of the author's two other books; and the work is also published in paper covers. The sale of the book in Great Britain in this latter form has reached over 40,000 copies.

NEW AND CHEAPER EDITIONS, UNIFORM WITH THE ABOVE.

ROUND THE WORLD. Cloth, $1.50.

AN AMERICAN FOUR-IN-HAND IN BRITAIN. Cloth, $1.50; paper, 25 cents.

*** *The three volumes, uniform, in a box, $4.50.*

*** *These books are for sale by all booksellers, or sent, postpaid, on receipt of price, by*

CHARLES SCRIBNER'S SONS,

The Nation.

NEW YORK, THURSDAY, JANUARY 26, 1888.

The Week.

We presume the defeat of Mr. Randall at Harrisburg in the organization of the State Democratic Committee will put an end to the talk, of which there has been a good deal, of the President's renomination having been endangered by his message about the surplus. Nobody in the Democratic party has so distinctly and unmistakably represented the opposition to Mr. Cleveland within his own party, on all sorts of grounds, good, bad, and indifferent, as Mr. Randall. He represented, too, in a peculiar degree whatever hostility there may be in the Democratic party to any revision of the tariff in the direction of lower duties. In fact, he has always been, in the House, the greatest obstacle to any revision of the tariff. Moreover, he had a Presidential "boom" of his own in preparation. Well, he has lost control of the State Committee in Pennsylvania. The election of a chairman took place on Wednesday week at Harrisburg, Mr. Randall himself being on the ground to direct operations and encourage his supporters. His "man" Sanders was beaten by a vote of 42 to 35. The Committee then proceeded to elect the Executive Committee, and the Randall ticket was again defeated. But a bitter pill still remained for Mr. Randall to swallow. A resolution was introduced by Mr. Scott, the member of Congress, heartily endorsing the Administration and in set terms the President's tariff message. The Randall party vainly protested against this as trampling on a bruised reed. The conquerors were, however, merciless, and carried it. All this in the heart of Pennsylvania, too, in the Presidential year.

A good many Republican papers with short memories are saying the same thing as the Rutland (Vt.) *Herald*, that "Mr. Lamar goes upon the bench under the reproach of being the first Justice upon whom the Senators ever largely divided according to party lines." Stanley Matthews was nominated for Justice in the last winter of President Hayes's Administration, when the Senate had forty-two Democrats out of seventy-six members, and was not confirmed. Mr. Matthews was again nominated for the place at the opening of the Garfield Administration, when the Senate was so evenly divided between parties that David Davis held the balance of power, and after long delay he was finally confirmed by one majority on an almost strictly party vote. Mr. Lamar having taken his seat on the Supreme Bench, it remains to be seen whether his appointment will be made a Republican issue in the coming Presidential canvass. It seems as if it would be rather a good thing to take up, because, like the tariff, a President who was elected on it would never have to act on it. With the Lamar issue, the Foraker hand-shaking issue, the surplus issue, the rebel-flag issue, the "Paris message," and ex-Gov. Fairchild's three kinds of palsy, the party ought to be able to make a desperate fight next summer.

The opposition in the House to the bill authorizing the issue of national-bank circulation to the par value of the bonds deposited as security therefor, instead of 90 per cent., as at present, are behaving in a very unseemly manner. The bill comes as a report from the Committee on Banking and Currency. It is before the House in the regular way. Mr. Weaver, the Iowa Greenbacker, has declared his intention to filibuster against the bill, or, as he puts it, to "apply properly the parliamentary rules of the House." This means that when the majority are in favor of a bill that you are opposed to, you will prevent the taking of a vote upon it by moving to adjourn and calling the yeas and nays on that motion, and then moving that when the House adjourns it shall adjourn to a particular day, and then calling the yeas and nays on that, and requiring the yeas and nays to be read aloud by the clerk, etc., etc. Mr. Weaver got only 55 members to vote with him against taking up the bill, 151 voting the other way; but since one-fifth of the members are sufficient to order the yeas and nays on any motion, there seems to be no way to overcome Weaver but to tire him out as he is trying to tire the House. It is quite as likely that a sufficient number of members can be found to vindicate the dignity of the body by sitting up o' nights, as that one-fifth of the members will sit up in order to help Weaver weave his web of dilatory motions. The bill itself is not nearly so favorable to bank circulation as Weaver's fancy paints it; but whether it be more or less so, the House owes it to itself to put an end to such spite work.

Ex-Justice Strong of the Supreme Court, who delivers a course of lectures on the Constitution before a Washington law school every winter, was asked by a student during one of his lectures last week whether in his opinion the Blair bill was constitutional. "I do not see how it can be constitutional," he replied. "It is my opinion that it is unconstitutional, and this I believe to be the opinion also of the present bench." This expression of opinion will not surprise anybody who is familiar with the course of the Supreme Court during the past fifteen years. Nobody can read the State-rights decisions rendered in such cases as the Kuklux Act and the Civil Rights Act without becoming convinced that, so long as the Republican judges who thus maintained the rights of the States remain on the bench, the court would promptly annul any bill establishing Federal control over education in the States if it should become a law. Judge Strong's remarks fully vindicate Senator Hawley's warfare against this measure on the ground of its unconstitutionality. The conviction of its equal unwisdom is steadily gaining strength.

A convention which had been in session at Washington for several days devising means to reduce the surplus, brought its labors to a triumphant close on Wednesday week. The resolutions adopted are adequate to the threatening condition of the surplus. They propose that the Government shall pay to every American ship engaged in foreign trade, whether steam or sail, 30 cents per ton for each 1,000 miles of distance sailed, and *pro rata* for any less distance than 1,000 miles—that is to say, a thousand-ton sailing ship sailing to Liverpool would be entitled to draw from the Treasury $900 per trip, or $1,800 per round trip. A steamer of 5,000 tons would draw $9,000 per round trip. In order to guard against fraud, it is provided that the distances shall be certified by the Hydrographic Office to the Treasury, so that no designing skipper sailing to remote ports can take the longest way around in order to enlarge his subsidy. No allowance is made for lying to in bad weather, or for detention in foreign ports. Nor is it required that the ship shall carry any paying cargo. A ship going in ballast, as they are sometimes compelled to, may draw the same amount of money as one carrying tea or silks. This, however, is in harmony with the spirit of the proposed measure, which aims not at the carrying of freight, but the carrying of the flag, as the last resolution shows. This resolution breathes the loftiest patriotism. After reciting that the vast manufacturing and commercial interests of this country are entitled to a foreign mail service, it is resolved that "such service can only be relied upon, in peace and war, from American hands warmed by American hearts under the American flag." But there is nothing in the resolution even remotely implying that "American hands" are to be exclusively employed, or employed at all, in this service. The only requirement is that the capital invested shall be exclusively American. Capital warmed at the rate of thirty cents per ton per thousand miles would not need the warming of American hearts in addition.

From statements made by Mr. W. L. Garrison and Mr. Arthur T. Lyman in the Boston *Post*, it is learned that the wool trade of Boston was not represented in the recent wool conference at Washington, and also that the carpet manufacturers did not agree to the programme finally put forth as the voice of the united interests of wool-dealers, growers, and manufacturers. It may be set down as a fact that any manufacturer of woollens who says that he is in favor of a tariff on the raw material of his industry tells an untruth. He is no more a free moral agent than were the guests of the Arkansas tavern-keeper who kept a pistol in sight at the head of his table, and said, "Any man who says he don't like hash, lies." Mr. Ly-

man, who is at the head of the Lowell Manufacturing Company, states an undoubted truth when he says that "under the wool-growers' threat of taking off the duty on manufactured goods, the manufacturers and dealers yielded to their demands for a restoration of the rates of 1867 or even higher rates." The worsted manufacturers have been crushed by the duties on their raw material and by the changes in the art of combing wool. They are now in a position where no attack made upon them by the wool-growers could do them harm. If all duties on wool and on worsteds were removed, they would be in a far better position than they are now. It is amazing that they should give even a tacit assent to this pernicious agreement. Probably the bill introduced by Mr Breckinridge to classify as woollen all worsted cloth imported, by whatever name it is known to the trade, is introduced with the expectation that the worsted manufacturers will ere long coöperate with the tariff reformers in efforts for free wool.

The Boston *Commercial Bulletin*, the special trade organ of high tariffs in New England, shows signs of wavering on the subject of the duties on carpet wool. Its latest opinions on that question are based upon a collection and compilation of the views of wool-growers, dealers, and manufacturers in various parts of the country collected by the *Bulletin* itself. A glance at the replies of the parties whose letters are published shows clearly that there is an intestinal strife among the three interests—growers, dealers, and manufacturers—that has not been allayed by the recent convention at Washington, and that cannot be. The special significance of the *Bulletin's* article is that, in spite of the apparent harmony secured at the Washington conference, the manufacturers, or, at all events, the carpet-makers, have not desisted from the agitation, but are keeping up the fight, notwithstanding the threat of the wool-growers to repeal *all* duties on woollen manufactures if the wool duties are disturbed. It is perfectly understood that anybody who is enjoying "protection" under the tariff as now constituted is at liberty to become a roaring free-trader if his part of the tariff is meddled with. He can run amuck at the whole list of duties without incurring any opprobrium or the imputation of British gold. But all others—that is, all who are so unfortunately situated that they cannot be protected by the tariff, or have been neglected by the tariff-makers—are to be jumped on as enemies of American industry and of American wage-workers if they favor any reduction of duties whatever. This line of distinction between friends and enemies of American labor is likely to become well marked as the fight goes on.

The letter of President Corbin on the Reading strike is a conclusive and crushing rejoinder to all the accusations and appeals that have been made to him to surrender his company to the Knights of Labor coal-handlers, trainmen, and miners, to be operated in their peculiar fashion of delivering freight only to good men, and mining coal only in case it is to be handled by the good and true; the discrimination between the good and the bad to be made by the local district assemblies. One would have supposed *à priori* that so fantastic a conception of railway traffic could never have entered into the head of any civilized creature. But we know that it did enter into the head of Martin Irons and his whole following of Knights in the Southwest as lately as two years ago, and that it resulted in the destruction of the order on the Southwestern system. President Corbin's letter makes it clear and certain that it will have the same result on the Reading system. The fact that the Reading Company was once ruined by selling coal for less than cost, having made a net loss of $12,000,000 in twelve years, which has only recently been made good by an assessment of that sum on the holders of its securities, is pretty good bail that President Corbin means business when he says that the company will not recede from the position it has taken. It will not recede because it cannot. But the miners will recede by and by, because they cannot live on air. The Reading Company has been trying to live on air for twelve years, and has failed in the attempt. It now seeks a more substantial diet.

The seekers for signs in the political firmament can find a very significant one in the first public banquet of the Reform Club on Saturday evening. Here was an organization, scarcely thought of a month ago, assembling in such great numbers that the rooms, which were feared to be too large when selected, were filled to overflowing, tables having to be set in the lobbies to accommodate those who were crowded from the main hall. Nearly or quite all in attendance had enrolled themselves as members, and the first official announcement which the President of the Club made was that the first limit of membership, 400, had been filled and that steps were already taken for the purchase of a club-house. No one who was present at the banquet could have been long in doubt as to what was the real cause of this phenomenally sudden growth. It was revealed when, at the first mention of President Cleveland's name by the Chairman, the whole assemblage broke into a roar of applause which seemed inexhaustible, and which was renewed with undiminished volume whenever throughout the evening the same name was spoken. The Club has, in short, sprung into existence full-grown in answer to the President's call for courage in politics.

The "Preachers' Meeting of the Methodist Episcopal Church in Baltimore" has disclaimed "all sympathy with and concurrence in the act of the President of the United States, performed in commemoration of the Pope's golden jubilee," as a "new departure in making such marked official recognition of a religious hierarchy claiming also temporal sovereignty." It would, of course, have been better if the President's act had had the approval of the Preachers' Meeting, but one has some difficulty in seeing the great importance of it. The Pope is one of the great facts of the world. Some hundreds of millions of people acknowledge him as the head of their Church. If by withholding recognition of him the President could abolish the Papacy, most good Protestants would probably think it a good thing to do. But this is impossible. As long as there is a Pope, and millions, of whom large numbers are fully as pious and conscientious as the Baltimore Preachers, revere and obey him, he becomes a proper object of courtesy to every civilized man, and especially to every civilized ruler. He is a far more estimable and useful person than the Czar of Russia or the Sultan of Turkey, and yet the Preachers would not have objected to a birthday or other present from the President of the United States to either of these. Moreover, it has always been held until now that the present of a good book was one which the best men could properly make to the very worst. The lower the opinion we have of the Pope, the more anxious should we be to put good literature in his way. Satan himself, the Preachers will admit, ought to have the Bible or any other good book put into his hands, if he could be got to read it. Why, then, not give the Constitution of the United States to the head of the oldest Christian denomination? The Preachers are also of opinion that the President's gift was "a political discourtesy if not offence to King Humbert." How can this be when King Humbert himself offered presents to the Pope, which the Pope refused to receive? The Preachers would feel very queer if King Humbert told them they had been making great fools of themselves about the whole matter, and yet we venture to assert that this is exactly what he would tell them if they asked him to speak his whole mind, for he is a plain, blunt man.

Gov. Hill, in granting a three days' respite to Driscoll, the murderer, intimated that he wished to help remove the stigma now resting on Friday as "hangman's day"; but if he expects to be able to rehabilitate Friday, he is greatly mistaken. He has one of the strongest traditions of the Christian world to contend against, and it is one which has now become a deeply rooted superstition even among people who care nothing about Christian traditions. Eighteen centuries of disgrace rest on Friday. All sailors and all servant girls, and especially cooks, all who dislike to sit thirteen at table, and all who have vivid dreams, regard it with deep suspicion. Moreover, millions who are not superstitious dislike beginning any long undertaking on Friday. Nobody is willing to be married on Friday, or would be born on that day if he could help it. From the earliest days of modern criminal jurisprudence it has been set apart as a peculiarly suitable day for the infliction of capital punishment. What harm this does, or why Gov. Hill should dislike it, it is hard to see. There is nobody especially interested in

Friday above any other day. There is no Friday vote. "Labor," we believe, dislikes Friday extremely, as a day on which there is never a holiday. In fact, there is some danger that Labor may resent an attempt to discredit Monday by deferring an execution to that day, as Monday is a day on which Labor is apt to enjoy itself. Moreover, Labor Day is the first *Monday* in September, so that it seems to us, in showing a want of respect for Monday, the Governor has put himself "in a hole" of the worst kind. Friday has no friends, but Monday has many, as he will find to his cost.

The object of the imprisonment of so many editors and orators in Ireland was to frighten them so that they would stop agitating, but now that the first victims of the law are beginning to emerge from prison after the expiration of their terms, it does not appear that much progress has been made. The editors and orators are apparently as defiant as ever, and ready to begin over again, and have been immensely raised in the estimation of the mass of the people. Moreover, there is no perceptible diminution in the agitation. The meetings, making allowance for the season, are still numerous, the plan of campaign is still carried out, and is proving more or less successful. The National League, too, continues to hold its meetings. There is a great scarcity of outrages, owing, doubtless, to the strenuous exertions of the leaders to prevent anything that will shock English opinion. In short, Mr. Balfour seems to be succeeding about as well as Mr. Forster. Mr. Forster locked up a great many men, but made them very comfortable in jail. Mr. Balfour locks up only a few, and treats them very badly in jail. The result is about the same. It remains to be seen how long the English constituencies, with whom the final decision now rests, will allow the farce to continue. They would probably stop it at once if they could be consulted, but the Ministry are determined not to consult them as long as they can help it. They say their policy must have a full trial.

The British Ministry are apparently threatened with a fresh crop of difficulties in Wales and Scotland, the land question being at the bottom of them all. In Wales there is fierce resistance to the tithes collected from the farmers for the benefit of the Anglican clergy, which compels the Sheriff to call for the assistance of nearly 2,000 police and soldiers. The trouble is, that the Anglican or Established Church in Wales is the church of the gentry. Hardly any of the Welsh people belong to it: they are mainly nonconformists of various denominations. Its clergy is supported, nevertheless, in large part by tithes levied on the farmers, who never enter its church doors, as used to be the case in Ireland. The Welsh are ordinarily peaceable and submissive, and bore this without a murmur as long as the times were good. But now that farmers find it very hard to make a living at all, and that the Irish have won so much by resistance, the Welsh, too, are adopting the "plan of campaign" against the Episcopal clergy; that is, they refuse to pay anything at all, or only what they think reasonable. And the clergy, who have to live, have delivered them over to the secular arm. In Scotland the disorder is simply agrarian. The crofters, or holders of small patches of land, find they cannot make a living on their holdings, and look with longing eyes on the great sheep-pastures and the parks into which so much of Scotland has been converted, and have taken to driving off the sheep and killing the deer. It is in vain that the political economists explain to them that sheep farming on a large scale is more profitable than their little spade husbandry, and that the mountains would never bring so much rent in any way as in "shootings" for rich Englishmen and Americans. Gunboats and marines have had to be sent against them. A jury has just acquitted a batch of them who were put on trial in Edinburgh, in spite of a strong condemnatory charge from the judge. If the Scotch should really get their blood up, a coercion bill for them would have to be the first work before Parliament when it meets in February.

The movement in England to unite the two branches of the legal profession, so that every lawyer may be able to practise either as a barrister or solicitor, as he pleases, has been fathered by the Solicitor-General, Sir Edward Clarke, who has made a very telling statement of objections to the present system of separation. The two principal objections are that it increases expense, by compelling every litigant to employ two separate lawyers, neither of whom is responsible in any way for the charges made by the other, and that it keeps young barristers in a state of idleness and often of destitution, in the early years when, although not competent to try cases in court, they are abundantly competent to prepare them for trial, or, in other words, to do the solicitor's work. But we believe the objection which most American lawyers who have watched trials in English courts would put in the foreground is, that the solicitor's instructions to the barrister cannot and do not take the place of personal communication between the barrister and the client which the English system forbids; and that consequently English jury cases are rarely as thoroughly tried as American cases are. The barrister, in other words, is never, or rarely, as completely charged with his subject as the American counsel is, and, owing to his never seeing his client, and having another man to stand between him and himself, does not feel the same sense of responsibility to him that the American lawyer feels. At the same time, we believe a good many American lawyers are of opinion that many advocates do their work in court far better when instructed by an expert than when instructed by a client. It is not every man who has the art of extracting from a client the essential features in his case, nor is it every man who finds out for himself whether he has the art or not. Of course it may be said that the work here divides itself naturally between the man who knows how to prepare and the man who knows how to present, but this division is not so easy as it appears at first sight, because when the barrister is made accessible to the client, every client insists on getting at him and "stuffing" him before the case goes to trial. He cannot put a litigant off by telling him that his story had better come to him through a third person.

The final refusal of the French Ministry, by a unanimous vote, to allow M. de Lesseps to start a lottery to raise money for the Panama Canal has caused another sharp drop in the shares, and led the old gentleman to issue a circular in which he gravely announces that he is going to appeal to the Chambers against the decision of the Cabinet, and asks the public to back him up by bringing pressure to bear on the Deputies. Even if he does not get his lottery, he is going to issue more bonds, he says, containing "the fullest guarantees." There is, however, no guarantee now which would do the canal any good except that of the French Government, and this he will never get until the Government makes up its mind to own the canal. This would be an adventure from which even Louis Napoleon would have shrunk, and which such rickety Cabinets as French Cabinets now are will hardly venture on. But the Cabinet must come to some decision as to what is to be done when Lesseps dies or comes absolutely to the end of his resources, in order to avert a dangerous panic.

Anarchism had a merry-go-round at Havre on Monday. Louise Michel was addressing a crowd of Anarchists. In the midst of her discourse a man named Lucas, one of the audience, fired two pistol shots at her, one of which took effect in her head. The other Anarchists set upon Lucas with the intention of lynching him, but the police, who have an inconvenient, superserviceable habit of "shadowing" Anarchist meetings, interfered and rescued him after he had been pretty savagely kicked and trampled on. Louise was taken to a hospital and Lucas to prison. It was learned on examination that Lucas had sought the hand of Louise in marriage—an Anarchist marriage of course—and had been rejected. All this was consistent with the principles of Anarchism. The only incident calculated to wound the finer sensibilities of an Anarchist was the untimely interference of the police. If an Anarchist woman refuses to marry an Anarchist man, why should he not kill her? Science tells us that man in the primitive state—the natural state that Anarchism seeks to revert to — universally "went courting" with a club. When he found a woman to his liking, he ordered her to follow him to his cave or hollow tree, and if she refused or hesitated, he knocked her down and dragged her off. This is the custom among Australian savages now. What unreasonable beings the other Anarchists at the Havre meeting were to interfere with Lucas's attempt to revive the customs of the golden age.

GOVERNMENT DEPOSITS IN THE NATIONAL BANKS.

Mr. John Jay Knox, in a recent article in the *Independent*, remarks that while there is no question about the security of the Government's money (some $50,000,000) deposited in national banks, "it will require very delicate management on the part of the Secretary of the Treasury to withdraw so large an amount from the banks at any time in the future without great disturbance to the business interests of the country." This is obviously a correct prognostication. The money is deposited in the banks because there is no outlet for the Treasury's accumulations. To hoard it in the Government vaults would be "contraction" at the rate of ten millions per month, and that is not to be thought of. Anything is better than that. The banks get this money without interest. They could hardly afford to pay interest, because they are obliged to buy bonds to deposit in the Treasury as security, and take the risk of their declining in the market, as they are pretty sure to do when the money is drawn out and the bonds have to be sold to get back the money to pay the Government. The Government deposits are meanwhile loaned to the banks' customers, the borrowing public, the business community throughout the length and breadth of the country. When the money is recalled by the Government, it must be recalled by the banks from their customers. It has gone into business channels. It is part of the "life blood of commerce." This is an exceedingly artificial state of things.

The taxpayers are not, as a general rule, lenders of money on commercial paper. They do not discount bills of exchange, or make advances on warehouse receipts, or on stocks and bonds. Merchants and manufacturers are not accustomed to rely on cash resources coming in small driblets from the people in their character as payers of indirect taxes. But this is exactly what is now going on at a pretty rapid rate. The Government is merely an intermediary, gathering up money from the consumers of sugar, tobacco, liquor, blankets, etc., and lending it to traders of every description to carry on their business with—an anomalous and ridiculous condition of affairs, not so disastrous as would be the hoarding of the money in the Treasury, but, as Mr. Knox says, creating a situation of much delicacy, and requiring extreme prudence on the part of the Secretary of the Treasury.

If we go back fifty years in our history, we shall find a similar state of things, as Mr. Knox also reminds us. On the first of November, 1836, the Government had on deposit in eighty-nine banks $49,377,986. These were the so-called "pet banks" of the Jackson and Van Buren Administrations. An act of Congress had been passed to distribute this surplus in four instalments among the States. The deposits in the banks were drawn upon for this purpose, but the business community, to whom the banks had lent the money, could not respond. Before the third instalment had been paid to the States the banks suspended, and the crisis of 1837 set in. The Government itself soon afterward suspended, and was obliged to issue Treasury notes to pay the salaries of its own officers and employees. It would perhaps be too much to say that the crisis of 1837 was caused by the Government's action in first swelling the amount of bank and mercantile credit, and then curtailing it in the manner described. Other causes were at work to the same end. But the Government's action was well calculated to precipitate disaster if the materials for one were at hand.

Mr. Knox points out the advantage to be gained in this critical situation by promptly passing the bill now pending in the House to authorize the banks to issue notes up to the par value of the bonds held by them as security for circulation, instead of 90 per cent. This would give them about $20,000,000 with which to meet the call of the Secretary for the deposited money. If this bill were amended so as to make it possible for banks in the large cities to retire from circulation the notes that they do not want to keep out—that is, by authorizing the reduction of the minimum amount of bonds held by each bank to one-tenth of its capital—there would be no increase in the aggregate amount of national-bank notes whatever, but merely a redistribution of them from places where they are not wanted to places where they are wanted, from the city banks to the country banks. And this would be especially helpful in view of the Government deposits in the banks, since the city banks can easily pay when called on, while the strain will be heaviest on the banks and business men of the small towns.

THE "BLOODY SHIRT" SYMBOL.

"Bill" Chandler, the new leader of the Republican party, has hitherto met with pretty good success in rallying Republicans to the standard of the "bloody shirt," which he unfurled as soon as he entered the Senate Chamber last month. With very few exceptions the Republican press has obeyed the orders of the commander, and applauded his reactionary proposals for Federal control of elections in the South and his warfare against Mr. Lamar. It had begun to look as though the Republican platform of 1888 was to be made by hopeless Bourbons without any effective protest.

But a revolt has suddenly broken out in the camp, which involves the repudiation of the whole bloody-shirt policy. The West has always been the favorite field of the Bourbons, and Iowa, of all the Western States, their especial stronghold. It has been a curious and puzzling question why the West, which is enterprising and progressive in material things, should be dull and slow in questions of national policy, but so it has long been. People in the East found out that the war was over long ago, but there seem to be many communities in the West where the inhabitants suppose that the strife is still raging, and sit up at night to get the latest news from the front. Easterners are commonly styled narrow and selfish by Westerners in comparison with themselves, yet it has been along the Atlantic seaboard, rather than on the prairies, that the magnanimity requisite to national reconciliation was developed. The "cold" New Englander has warmed towards his Southern brethren in the reunited nation, while the "bluff and hearty" Western man has kept on taunting them with their defeat, and yelling all sorts of opprobrious epithets at them.

When, therefore, a representative Republican newspaper of the West serves notice upon the Republican party that it must change its ways on this question, it means a great deal; and this is what was done by the *Iowa State Register* on Sunday week. The *Register* is the leading Republican paper of Iowa, and its editor, Mr. J. S. Clarkson, is the Iowa member of the Republican National Committee. Hitherto, it has always been an out-and-out bloody-shirt organ, calling all Southerners—except the few who vote the Republican ticket—"rebels," ranting about "the Confederacy in the saddle," and talking generally like a Bourbon of the Bourbons.

The "constant reader" of the *Register* undoubtedly rubbed his eyes soon after he began the editorial entitled "The Party Platform for 1888," to make sure that he was awake, for more surprising matter he had never encountered in those columns. The article set out with the declaration that "the contest of 1888 will be decided fully as much by the platform as the candidate, if, indeed, the platform is not far more important than the candidate." It proceeded to attribute the defeat of 1884 largely to the platform of that year. Dropping that absurd pretence about the party's having been beaten by poor old Dr. Burchard, the *Register* confessed—and the confession must have been good for its soul—that "it was Republican business men voting against their party who defeated it in New York, Connecticut, and New Jersey."

Looking to the future, the *Register* asks, "How shall the platform of 1888 be so made as to regain these business men and to recoup the party for its losses in 1884?" It insists that this is not a matter of sentiment, but one of deliberate political calculation and solution. "It is clear," the *Register* says, "that the seaboard cities are determined to have good relations reëstablished with the South. It is clear," it adds, "that there is no longer a majority in the North to respond to the nobler issues on which the Republican party has so long stood. *It is clear*," it finally asserts in the bluntest manner, "*that there is no longer a majority in the North to sustain that idea in public affairs symbolized by the name of the bloody shirt.*"

The *Register*, for consistency's sake, deplores the fact that such a state of things exists, but it frankly admits that it does exist. Things being so, it says: "The Republican party may still breast the current and so prove the heroic spirit of its organization and purpose; but what good is it to it, or any interest it would serve, when in doing so

it keeps itself out of power, and therefore unable to protect in the least degree any interest of the loyal people, or any interest of the survivors of the Union Army?" The *Register* goes on to point out that the Republican party, by clinging to the bloody shirt, "has at the same time kept itself incapable of gaining new friends in the South." It holds that Kentucky, North Carolina, Tennessee, and the Virginias have a majority of voters who are with the Republican party on the tariff issue, "and who would vote the Republican ticket if they did not have to vote, in doing so, for a platform which taunts them with their record in the war." It concludes that the time has come to "desectionalize the party," to bid for the support of the "new voters"—in short, to renounce Bourbonism and all its works; and it thus calls upon the West to take the lead in the change of base which it recommends:

"The war is nearly twenty-five years away. The republic is now to be reunited, and the Republican party is the only one the country has ever had with heart and brain both great enough thoroughly to reunite it. The Eastern States have practically decided for the departure; the great seaboard cities have fully decided in favor of it; the West and South are neighbors in location and interest and are rapidly growing together. A million new voters are being added every four years, to whom the war for the Union is a history and not a personal experience, and who are not swayed by its passions or memories. The South will never yield the power it has taken back to itself, and can keep to itself on the line of the old issues of the war, and the majority of the North has refused longer to antagonize it on that line. The North is Puritan and the South Cavalier. The Puritan with a thing accomplished turns his back upon it, and goes forward to new things. The Puritan is the North. Can he not conquer the Cavalier by recasting the issues of the day, and showing himself to be his neighbor and willing to be his partner? Feeling has died down in the North, and as it shall die down here so will it disappear in the South."

The *Register* concludes, as it began, with the declaration that "the Republican party failed on its platform of 1884," and that "it must change its platform if it shall win in 1888." The importance of such a pronunciamiento from such a source cannot be easily exaggerated. It means a break in the bloody-shirt ranks, where a "united front" was the only hope, small as that hope was, of the Northern Bourbons. It means that the bloody shirt must go.

We heartily congratulate the *Register* upon its awakening, and wish it well in its efforts to arouse other Republican organs to a realizing sense of the situation. At the same time we feel bound to add that it is a case where wisdom comes too late. The *Register's* article was published on Sunday. On Monday all but three of the Northern Republican Senators voted to reject a thoroughly reconstructed Southerner for Supreme Court Judge on the ground that he was a "rebel" and "traitor." No Southern State will vote in November, 1888, for a party which thus treated a representative Southern man in January, 1888. Nor will any death-bed repentance of the *Register's* sort bring back into the Republican party patriotic Northern men like that veteran Republican and Union soldier, Col. George E. Waring, jr., of Newport, R. I., who was finally driven to abandon it, in his own words, by "the attitude of the party leaders towards the confirmation of Mr. Lamar."

THE PRESENT STATE OF SUBSCRIPTION.

THE dissensions in the American Board over the lawfulness of letting the heathen know anything about the doctrine of future probation, have directed fresh attention to the present state of subscription to creeds in the churches. On this subject a distinguished theologian recently published some advice to a young minister. The latter was supposed to be in an uneasy position ecclesiastically. Allusion was made to the suspicions of his orthodoxy entertained by his older ministerial brethren, to his own longing for a more congenial, because more liberal and up-to-date, denomination, and to various other thorns in his cushion. It was rather curious, however, that not the faintest reference was made to the question of the young man's personal honesty, in the attitude in which he found himself towards a creed which was distasteful to him, though he had sworn allegiance to it. It was curious, and yet it was not at all curious, as things are going; for subscription has come to be largely recognized as more of a form than anything else, and the case cited is simply significant of the lapsing of the question so strenuously debated fifty years ago.

It should not be inferred from this that there is no longer any restlessness on the part of young men in submitting to the same creed tests from which some of their fathers shrank, or that consciences are not as tender now as a generation ago. The difference is that palliatives have been discovered in the last score of years. One of these is an open and distinct relaxing of the terms of subscription. This has appeared in English and Scotch ecclesiastical legislation, but has not, so far as the writer knows, yet overcome the prejudice in America against English importations. In the University Tests Act of 1871, the burden of subscription to the Articles was entirely taken off the backs of the students at Oxford and Cambridge, except in the cases of divinity students, who, with the fellows, professors, and heads of colleges, were still required to subscribe. The latter, however, were supposed to be greatly relieved, in common with all clergymen of the Church of England, by the Clerical Subscription Act of 1865, which substituted a general assent in the place of a declaration of assent to "each and every article." It was indeed argued in Parliament, at the time of the proposed change, that there was no real letting down involved, since the whole was made up of all its parts, and there could be no honest assent to the whole if some parts were excluded; furthermore, it was said, if a subscriber may exclude any one part, he may also any other, and thus there would be no validity to the creed whatever. But these views were argued against by the friends of the bill, and it has been accepted as a great boon by troubled consciences. In this way Dr. Arnold's idea of subscription, which gave considerable scandal in its day, had to wait only twenty-four years for legal enactment. It was in 1841 that he wrote to an old pupil: "The real honesty of a subscription appears to me to consist in a sympathy with the system to which you subscribe, in a preference of it, not negatively, merely as better than most others, but positively, as in itself good and true in all its most characteristic points."

But that even this has not afforded thorough and permanent relief appeared from an article in the *Nineteenth Century* for September, 1885, entitled, "Why Men Will Not be Clergymen," written by a young Oxford man, Mr. Hubert Handley, who said that he, with many others in the universities, were far from being satisfied with the relieving legislation of '65; that their education had led them to believe many things which not only found no countenance, but were positively denounced, in the Articles; and that, while they had the greatest reverence for Christianity and a high affection for the Church of England, they could not see their way to take orders honestly. A postscript to the article stated that, since writing what had gone before, the author had been informed by the highest authority of the Church that a clergyman was at liberty to hold any scientific or historical opinions he pleased; but it added that, if this were so, it ought to be made known, directly and legally. Till it should be, the Oxford young man felt the old difficulty.

Even in Scotland, where men proverbially take their theology so hard, a beginning has been made in rendering subscription less severe. The Synod of the United Presbyterian Church of Scotland adopted in 1879 a declaratory act, expressive of the sense in which the ministers and elders of that denomination are to be understood when they assent to the Westminster Confession. The explanation amounts to this, that they do not take several of the clauses of that symbol in the obvious meaning of the words. But the important thing is that the movement was decidedly in the direction of liberality, and that it has been hailed as a great relief by many who have benefited by it.

A second palliative is found in the various movements for creed-revision. Of actual accomplishment little can be said. The Creed Commission of the Congregational Church, and the new creed devised by that body and submitted, with general acceptance, to the denomination, are the most recent and positive achievements in this direction. The Cumberland Presbyterians before that had got out their new and revised edition of the Westminster for their own use. There is more or less sporadic talk in the Presbyterian Church of attempting a revision of its doctrinal standards, but nothing tangible has resulted, thus far, except the relief given some advocates of amendment in freeing their minds by speaking out in meeting. In fact, it would seem that little more is to be expected along this line. The Congregationalists are at present serving as a warning to the other denominations. Within the limits of ministerial clubs, it is often admitted that the creed is not exactly what it ought to be, and that it would be a great

comfort if some of its items had not so laboriously to be explained away; yet all hasten to add that the time has not yet come for any change.

One reason why they do not feel it imperative that there should be a change, and the most effective of all the palliatives, is to be found in the fact that subscription is nowhere taken so seriously as it used to be. That is to say, what was attempted for clergymen of the Church of England in the act of 1865 has been quietly and almost insensibly brought into practice in this country. An ambiguous assent, in general terms, is everywhere substituted for the older strict acceptance of the letter. In few cases has this come about through any distinct ecclesiastical action. It is simply custom gradually gaining the force of law. Men now assent to creeds as a "system," "as a whole," and feel at perfect liberty to reject certain parts—a considerable number of parts, sometimes—parts once, at least, thought vital to the system.

Probably the most conspicuous instance of such an assent is the subscription to the Articles of the Episcopal Church in the United States by its candidates for orders, which is, so to speak, by indirection, that is, by engagement "to conform to the doctrines and worship" of that Church. None of its clergymen are held strictly bound by the merely formal assent they give before ordination. A prominent clergyman of that Church felt entire freedom to say of the Articles, publicly, that they "are not generally approved." It is clear that, in such a case, subscription cannot be felt as a burden. Similarly, though in a less degree, has it fared with the Presbyterian churches. Since the reunion of the Old with the New School branch, an acknowledged, if not a strictly legal, latitude nas been attached to subscription to the Westminster Confession. Certainly the Presbyterian subscription is allowed to mean some things in New York city which it would not be allowed to mean in Pittsburgh. It is allowed to mean some things in Pittsburgh which it would not be allowed to mean in South Carolina. If a young man seriously asks what forms and shades of doctrine are essential to the system to which his assent is required, the highest Presbyterian authority will tell him that it is an unsettled question. But if he wanted to find out what the entire Church would consider to be the heretical among several competing opinions, his only way would be to try to carry a case through all the church courts. This will not be found exactly a royal road to knowledge.

Now, it would be a mistake to infer that the condition of things thus outlined shows moral looseness on the part of those concerned. The ministers and authorities of the churches are not guilty of playing fast and loose with such solemn obligations. The difficulty is rather in a complete oversight of the question. The vast majority show themselves unwilling to take steps to remove what a few feel to be a grave defect, because the vast majority do not perceive that any defect exists. Their minds are directed almost exclusively to other aspects of ministerial life. Their profession is an exacting and absorbing pursuit. Matters of immediate practical concern loom up so large that remote and delicate questions, like the one in hand, are not seen. It may be safely said that the matter of subscription to a creed is a thing to which the great mass of clergymen do not give many minutes of thought in a year. To most of them the whole affair is *res adjudicata;* they signed the creed so many years ago, at ordination or installation, and since then they have not bothered their heads about it. If you talk to them about church extension, about missions, about the relation of laboring men to the churches, you find them awake and interested; but if you once begin on the question of subscription, it strikes them like a particularly dry bit of ancient history.

BYRON'S CENTENARY.

THE absence of any widespread interest in the centenary of Lord Byron, which occurred on Sunday, is a marvellous illustration of the vicissitudes of literary reputation. Only in Greece was public notice taken of it. The brilliancy with which his fame burst forth, the unexampled rapidity with which it spread through Europe, the powerful influence it continued to exert on the youth of the next age, were to the men who witnessed them sure signs of the magnitude of his future renown. The decadence into which it has fallen would have been incredible to them. But so far are we from that strong impression of his genius that the comical incident of his grandson, Lord Wentworth's, feeling himself called on to protest against any public notice of the illustrious poet from whom he sprang, excites only a feeling of amusement, and seems a kind of caricature of the irony of fate. It was Byron's distinction to have been the first man of letters who enjoyed an international reputation at once; and one can hardly credit the fact that he has shrunk so wonderfully. In the month that he died Sir Walter Scott, in a brief article which attracted wide attention, said that it seemed almost as if the sun in heaven had been extinguished; and when Scott soon followed him, Landor, writing to Crabb Robinson, remarked that the death of these two had "put the fashionable world into deep mourning," and drew gloomy predictions, in the well-known manner of contemporaries, because the great men were leaving no successors.

Something of the shock of Byron's death and of the exaltation of his genius at the moment was due to the manner in which he met his end; he had fallen like one of his own heroes, died in a cause, and appealed to the romantic feeling of the age. Even then, however, to admire him was found to be a different thing from approving him. When the thirty-seven guns had been fired at Missolonghi, and the Turks had responded with "an exultant volley," and the ship had brought home the remains, the Abbey was refused, and he was buried in the common soil of England. Two incidents of the funeral bring him very near to us. Lady Caroline Lamb met the cortège as she was driving, and, on being told, in answer to her question, that it was Byron's, fainted in her carriage; and Mary Shelley, as she saw the procession winding down, reflected on the short-sightedness of human life, asking who could have foretold at Lerici such changes as she had witnessed in two short years.

Hobhouse could raise only a thousand pounds for a memorial with all his efforts, but with this he got Thorwaldsen to make a statue which was sent to England in 1834. The Abbey was again refused, and, to the discredit of the nation, this work was allowed to remain stored away in the Custom-house eleven years, because no fit place could be got to put it. At last, in 1845, Dr. Whewell gave permission to set it up in the Library of Trinity, which it still adorns. Thirty years later came the miserable fiasco of Beaconsfield's Committee, which, far from making Newstead Abbey a national possession and gathering there the relics of Byron, placed in Hamilton Park (other sites being refused) that statue of the poet leaning on the rocks, with his dog Boatswain beside him, which can only be described as popular melodrama in stone, beautiful only for the mass of red marble which the Greek Government gave for its base. It is to be remarked, also, that at this time the Abbey was a third time practically refused, as Dean Stanley, out of respect to the action of his two predecessors, but not apparently for any other reason, precluded application for erecting a tablet there by a letter in which he said he preferred the subject should not be brought before him.

The history of monuments, however, is not necessarily proof of fame. Others of England's greatest do not sleep in the Abbey, and the hero not infrequently waits for his statue a long age. The place of fame is on the lips of men, and Macaulay, when Moore's Life came out, could speak of Byron as "the most celebrated man in Europe." The decline of his vogue was nevertheless rapid and unmistakable. We all remember Carlyle's oracle — "Close thy Byron; open thy Goethe." This must have been about 1840. But, unfortunately, as one writer observes, to open Goethe is to return to Byron's greatness. Did not Goethe tell Eckermann that a man of Byron's eminence would not come again, nor —save the mark!—such a tragedy as "Cain"? He thought him greater than Milton—"vast and widely varied," whereas the latter was only simple and stately. Perhaps, as we have been told, Goethe was flattered by Byron's imitation.

Whatever was the reason, the critical judgment of Goethe is one to be weighed with regard to Byron, and to himself, also, for that matter. What part Goethe's praise may have had in making Byron the hero of "Young Germany" we have no means of determining, but his works were vital in the new age there, and still his hold seems greater on the Germans, if we may judge by the test of translations and biography, than it is elsewhere on the Continent. Heine was more than touched by him, though he was far from being his duplicate, and could see the humorous side of those young Parisians—Musset the foremost—who were melancholy in the

full glow of first manhood, and went about in despair dining sumptuously every day. One pities Musset, for Byron was, as much as another man can be, the secret of his fate. Lamartine caught only the sentimentality of Byron, but Musset assimilated his darker spirit, his recklessness, and license, and scepticism, and transmuted his very coarseness into a Parisian vulgarity. Stendhal and Sainte-Beuve paid tribute to him; and, to cut the subject short, Mazzini thanked him in the name of Italy, in Spain Espronceda drew his inspiration from him, and Castelar in the later time eulogized him for his liberating influences in the peninsula with Spanish amplitude of phrase. Karl Elze thinks that the Russian poet, Pushkin, was his child; if it were so, Byron might well be proud of what such an influence was the beginning of in Russia. This rapid survey, with its brilliant names, impresses the mind with the range and dominance of this man, of whom Landor's sneer, when he hoped that "the mercies which have begun with man's forgetfulness may be crowned with God's forgiveness," does not now seem so absurd as formerly.

To look at the matter from this point of view, however, is to confuse Byron with Byronism. There was a European mood, a temperament of the revolutionary time, that fed on Byron, but he was not its creator, and to regard him as more than a single influence of many that moulded the young men of the next generation, is to give him vastly more than his due. This is the secret of his vogue in Europe—not that he liberated their minds, but that he set the fashion for minds expanding in a new age of intellectual pride and moral irresponsibility, helped to form their attitude, and was a rallying name for the faction. He was licentious, but he was neither democratical nor atheistical; he had no body of opinions properly thought out and correlated with social facts, either in politics or religion; he had no strong convictions even; but, with prejudices of rank and reminiscences of Scottish theology from which he could not free himself, he was an impulsive and therefore uneven revolter from the old régime, and never quite at home in the new camp. He preferred, he said, to be beheaded by the King and not by the mob; and the whole aristocrat spoke in the saying. Shelley wrote of him, "The canker of aristocracy needs to be cut out," and he hits off Byron's inconsequence in religion where he speaks of him under the name of Maddalo and contrasts him with himself. Maddalo, he says, took a wicked pleasure in drawing out his taunts against religion; but, he adds, "What Maddalo thinks on these matters is not exactly known." Byron is believed to have talked with Shelley more seriously than with any other man. He did not himself know what he thought; and his state of mind was well expressed by his remark to Lady Byron, "The trouble is, I *do* believe." As Stevenson lately observed, the old Gordon blood was strong in him. In substance, therefore, unlike Shelley, who was democratical and atheistical on principle, Byron was far from being the ideal of the various "young" nationalities, France, Germany, Italy, and Spain, in the principal tenets dear to the age. It was rather his personality, and what they transformed him into by their worship, that had power over them in their search for "liberty"; and truly, though his ideas were incomplete and fragmentary, and inextricably blended, even in their formation, with his impulses and the accidents of his position as a pariah of genius, yet there was a contagion in his spirit, a dash of energy and of abandon, that told as blood tells more than thought.

One advantage, too, Byron had with foreign nations that with his own counts as a defect. He had no form, no art, no finish; and the poet who failed in these things can be read in our day only by a kind of sufferance, and with continual friction with what has come to be our mastering literary taste for perfection in the manner. It follows from this defect that he bore translation better than he otherwise would. His quality is power, not charm; the mood, and the situation, and the thought are the elements that count in his poetry, while the words are at the best eloquent or witty, but not "the living garment of light." The result was, that he could be given almost completely in a foreign language; he lost practically nothing. This consideration may go far to explain the relative estimate of him by foreign writers in comparison with other English poets; for these others who have the charm that cannot be transfused, the art that will obey no master but its own Prospero, are seen, as one may say, without their singing robes; and their poetry, made prose, loses half its excellence. This, together with the German element in one portion of his work and the strong Italian influence in a larger portion, especially in 'Don Juan,' must be taken into account in any attempt to understand why he was the best known English poet on the Continent, and perhaps, with the exception of Shakspere, still is.

In England, Byron's reputation met with rapid decline from natural causes. It is not likely that his misconduct in morals was much against him, and Beaconsfield was wholly on the wrong track when he reminded the Byron meeting that, after half a century, a man's private life scarcely enters into the estimate of his literary genius. It seems rather Byron's lack of orthodoxy that England most resented. Society put up with much libertinism in those days in high quarters; but Byron had attacked the faith, or at least elements of it which the Church shared in common with Calvinism, and this was too shocking a matter for a society which found hardly more than matter for gossip in natural sons and daughters. This was the reason which a bishop alleged in the House of Lords in answer to Brougham, in the debate on the second refusal of the Abbey. Byron had attacked Christianity, and he should not be interred "in the Temple of our God." The middle classes have always rejected Byron, in like manner, because he scoffed, though, no doubt, his life and the licentious portions of his poetry also offended them. From the first his scepticism was heavily against him, and probably it still remains the strongest objection to his works in the minds of Englishmen generally. In Landor's bitter attack (he had offended Landor by rhyming his name with *gander*) this charge is made the climax, and the passage is brief enough to quote as the best word of Byron's enemies:

> "Afterwards, whenever he wrote a bad poem, he supported his sinking fame by some signal act of profligacy: an elegy by a seduction, a heroic by an adultery, a tragedy by a divorce. On the remark of a learned man that irregularity is no indication of genius, he began to lose ground rapidly, when, on a sudden, he cried out at the Haymarket, *There is no God.* It was then surmised more generally and more gravely that there was something in him, and he stood upon his legs almost to the last. Say what you will, once whispered a friend of mine, there are things in him strong as poison and original as sin."

This, with all its excess, is no inapt character of Byron, as English prejudice drew him.

On the other hand, much that was in his favor at first was necessarily temporary. The man had a story. He was one of the picturesque characters of the age, and while he lived he was interesting to his time merely for his personal fortunes. It was to his gain, too, that he identified his own romance with that which he early invented, appealing to the adventurous in men and to the pity and admiration of women. His heroes are strong, and strength succeeds with the sex in fiction as well as in life; and they are, besides, usually faithful in love, while their crimes are taken out of the moral region of deliberate choice by a kind of emotional sophistry, and somehow are charged to their circumstances, so that the unwary and innocent reader commiserates their villanies instead of being revolted by them. These tales (and no part of his work was more popular) are trying reading to-day, but we forget too readily what raw and bloody fiction the world had in the first score years of this century; we cannot conceive how London ran after stories of blighted brigands and sentimental corsairs, in the very thunder of Waterloo. But so it was, and Byron was more interesting in that he was the unhappy and noble original from which the pirates of his imagination were drawn. If he changed the scene and wandered over Europe as Childe Harold, he gained in sentiment; if he wore the mask of Manfred, he gained in tragedy; and if he sneered in Don Juan, there was the jaded man of the world, perhaps more interesting. He was, moreover, a peer; but a dead peer certainly is no better than a dead lion, and when he died, why—the fashion in collars changed. Other living personalities occupied the stage; England grew steadily more sincere in religion, more strict in the standard of private morals, more exacting of seriousness in thought and of perfection in literary form; and all these influences were adverse to Byron, who made no offsetting gain in his own country from the revolutionary fervor that helped him on the Continent.

What is there left? Some stirring passages of adventure, some eloquent descriptions of nature, some personal lyrics of true poetic feeling, dramas which, it is to be hoped, have

finally damned "the unities," and one great poem of the modern spirit, 'Don Juan.' And what remains of that melodramatic Byron of women's fancies? His character has come out plain, and we are really amazed at it—proud, sensual, selfish, and, it must be added, mean. Ignoble he was, in many ways, but, for all that, the energy of his passions, his vitality, his masterly egotism, and the splendid force of his genius, made him a commanding name and stamped him upon the succeeding European time. He cannot be neglected by history, but men certainly appear to pass him by. Arnold has endeavored to bring him back by a collection; but Arnold's critical views on poetry seem to be justifications in age for the tastes he had when he was young—reasons after the act. A late biographer thinks that the decadence of his fame is due to the conservatism of the last half-century, and that in the revolutionary age that ought soon to be beginning, he will retrieve himself. But can this be hoped of a "revolutionary" poet whom Swinburne has cast aside? The prediction does not convince us. Byronism has gone by, and the age of the "enlightenment" in Germany and France; such a mood is not repeated. Goethe outlived Wertherism, but had Byron such good fortune? In his own character there are such defects as forbid admiration in the light of our moral ideas; and in his poems, taken apart from their time, there are other defects, both in their substance and, unquestionably, in their form, which forbid the sort of approval that would make them in a true sense classic, as a whole, though the qualities that make 'Childe Harold' and 'Don Juan' great, and preserve here and there passages in other poems, are those that confer immortality. He was a poet; he was a force, also, that spent itself partly in creating a world-wide affectation, and partly in rousing and reinforcing the impulse of individual liberty on the Continent; but he is a poet no one can love, and he left a memory that no one can admire, and there is none of his works that receives the meed of perfect praise. And, as to the fruits of that vast influence, is it hard to say whether they were more good than evil? At all events, it is certain now that Sir Walter indulged in a tremendous hyperbole when he likened Byron's extinction to that of the sun in heaven.

THE HIGHER EDUCATION FOR WOMEN IN NEW YORK CITY.

NEW YORK, January 21, 1888.

AT the present moment there are from New York city and suburbs two women students at Cornell, four at Bryn Mawr, thirteen at Smith, seventeen at Vassar (besides fifteen in preparation for it), and thirty-one at Wellesley; making a total of fifty-seven students coming this year from New York city or some place whence they could easily attend a day college in New York. And if fifty-seven girls can leave their homes and encounter the discomforts of an independent life for the sake of pursuing a collegiate education, how many would attend college gladly, enthusiastically, were it not necessary to face the obstacle of leaving home? It is certain that where fifty New York mothers would consent to their sons leaving home to study at Harvard or Yale, only four or five of them would permit their daughters to attend Wellesley or Vassar. The principal of one of the best schools for young ladies, a school where the pupils are fitted conscientiously for a collegiate curriculum, told me the other day that, though she has only lately begun, she has sixty-five pupils (including two grades, seniors and juniors), and that, of the seniors, sixteen from this city are about to enter some college (Wellesley, Smith, or Bryn Mawr), and at least five more are wofully bemoaning their fate because their parents will not allow them to leave their homes.

For the last thirteen years there has existed a "Society to Encourage Studies at Home." It merely aims to encourage women to study by a system of correspondence between teacher and pupil. It wisely supposes that there are a great many women who have a taste for study, but cannot leave their homes to attend college. A pupil can study as much as she thinks she is able, and can become as proficient as she wishes in any branch of knowledge that is capable of being studied at home, and without a tutor upon the scene. No degrees are given, but a certificate stating exactly what has been studied, and with what success. The teachers are women of culture and refinement, and correspondence with them is a great boon. Of the women in New York who are longing for *something definite* to do in the way of study, and are prevented from attending college because there is none in the city, thirty-three pursue this course, besides thirty-six others that live in the vicinity, thus making a total of sixty-nine girls in New York and vicinity who are studying by this method for lack of better.

Sixteen hundred girls go to Normal College. Out of these 1,600, only a small number become teachers, and that is the object and worth of the college—to turn out teachers. The curriculum at Normal does not satisfy the demand in women for a complete collegiate course; seven graduates of Normal College are now studying at Columbia. It is commonly supposed that only parents who could not afford to pay tuition fees send their children to Normal College. On the contrary, a very large number of the parents could easily afford it, and would gladly send their daughters to a private college where a higher curriculum and degrees could be procured. For such as cannot afford to pay tuition, President Hunter tells me he is very anxious to secure the right of conferring degrees as the New York College for boys has the right. He would also alter and improve the present curriculum of Normal College, having an Art course for such as would care to take the degree B.A., a Normal course for such as would care to become teachers, and possibly an Industrial course for such as would wish to earn their living as artisans.

There exists also an apology for a collegiate course for women held out by Columbia College. There have been thirty-eight girls who began that course. During the four years, eight have dropped from the ranks—either from discouragement at the slender advantages offered and many difficulties to contend against, or perhaps from nervous dread of encountering the phalanx of staring youths; one girl has graduated and received her certificate, and one more has put argument into the mouths of the enemy by leaving the course to enter upon married life. Thus, with wonderful perseverance, twenty-eight girls have continued to take the course. These twenty-eight girls have worked nobly, actuated by the sentiment that a principle was at stake. They felt that they were there on trial, on probation; several of them, though deriving but little benefit from their labors, still kept on, hoping that their perseverance would finally induce the trustees to open to the women students the full privileges of the college.

By a resolutfon of the trustees of Columbia College adopted June 8, 1883, it was ordered that "a course of collegiate study equivalent to the course given to young men in the college, should be offered to such women as may desire to avail themselves of it, to be pursued under the general direction of the Faculty of the College, in accordance with the following principles, and regulations," etc. This read excellently—it seemed as if the long-talked-of loaf was at last to be thrown to the women; but, alas! it soon turned out to be a stone, and of a particularly indigestible quality. These "principles and regulations" simply were to the effect that the women could pursue their studies wheresoever and howsoever they pleased, except under the sacred roof of Columbia. Their unhallowed presence was not for an instant to be sanctioned in the laboratory or lecture-room. All that concerned Columbia was that the women were to be present at its examinations twice a year, and to be able to answer certain questions, which questions satisfactorily answered, they were at liberty to return home again and prepare for the next set of questions.

It is no easy task for a girl to study alone, unaided by tutor or professor, and prepare for examination papers more difficult than had the boys, inasmuch as the examinations for women were prepared from the entire range of the books, and the examinations for men prepared only from lectures, the particular bent of which had become familiar. Yet twenty-eight New York girls are now doing it.

A couple of years later the trustees passed a resolution allowing the college to confer degrees on women if they had in all respects followed the full equivalent to the boys' course—in all respects except the important ones of attending lectures and working in the laboratories. Is it to be wondered at that only two or three have essayed to gain a degree of B.A. or B.L. under such conditions?

The women have been admitted, during the past couple of winters, to lectures given at Columbia on Saturday mornings. Prof. Boyesen, Prof. Charles Sprague Smith, Dr. Butler, Dr. Titus M. Coan, and others have been heard with great enthusiasm each week by some 200 ladies, and many applicants for tickets were obliged to be refused. Some years ago several professors were in the habit of inviting a few ladies to attend their lectures. The ladies enthusiastically availed themselves of the invitations, and were among the most ardent listeners. Among the ladies invited were some members of the President's family and a daughter of one of the trustees. All was going smoothly when, unfortunately, the trustee in question in an evil moment was seized with the desire to read the Constitution and By-laws of the College. To his horror he found that, in allowing his daughter to attend the lectures at Columbia, he was violating the laws of the college! He at once withdrew his daughter; the President could scarcely permit his relatives to remain, so he was obliged to follow the example of the trustee, and soon there was not a woman left.

The President called a meeting of the trustees and read them the resolution passed some years ago by them, and essayed to prove that the admittance of women to the lectures was not against its spirit, but only the letter of it. The resolution was to the effect that no person should be allowed to attend the lectures of the

college professors, without having duly matriculated as a student of the college. The President clearly explained that at the time the resolution was passed there was no thought of women entering the college or asking for admission to the lectures. The resolution was passed merely to prevent the possibility of the professors permitting men to attend their lectures, pocketing the receipts obtained, and thus depriving the college of its tuition fees. As the admission of women to the lectures was a matter of courtesy, and known to the college, there could be no such objection. Notwithstanding this very plausible reading of the resolution by the President, the trustees agreed that women must no longer be allowed to attend any of the lectures.

Failing in his object, the President then called another meeting and asked the trustees to legalize the admission of women to the lectures by another resolution worded carefully, so as to preserve the spirit of the original resolution. This they refused to do, and even those who had hitherto shut their eyes to the prevailing habit now vehemently opposed the resolution permitting it. When asked by the President for an explanation, they could only answer that they wished the question had never arisen before the Board, for, though in the irregular operation of the illegal habit they had seen no real objection, still they were loath, officially, to advocate such an advanced and liberal (and possibly demoralizing) condition of things. So, since that day, no women have been permitted to attend the regular lectures. Even if women could legally be admitted to the lecture-room, there would still exist a reason why coeducation could not take place at Columbia College proper. Columbia, like Harvard, needs all her income for the institution as it now exists, and does not care to assume new responsibilities.

President Barnard has told me that he has every reason to believe that if only the funds for a separate college could be raised, and a building not far from Columbia be built or hired, there could be soon put in working order a successful college with its instruction furnished by the professors and other instructors of Columbia College. I have not met with any professor that would not be heartily in favor of such a plan. They all agree in thinking that the present course at Columbia for women is little more than a farce, and yet the women students continue to increase in number, so eager are they to pick up the stray crumbs of knowledge that are offered them. Even now, though there is not yet a regular college where women can be instructed by the professors of Columbia College, there are a great number of principals of private schools for young ladies who, shrewdly seeing how anxious their pupils are for something, anything, really collegiate, have engaged one or more Columbia professors or tutors to lecture to the girls during the winter, and the different instructors may be seen scattered about the city as trump cards in the hands of clever schoolmistresses.

An annex to Columbia would, of course, be compared with the Harvard Annex. It could well bear comparison. The Harvard Annex has been established for about eight years; it began with twenty-seven students and to-day has 100 students. It now occupies modest but comfortable quarters in Cambridge, and only requires to be recognized as permanently connected with Harvard University to become a perfect success. The founders of the Harvard Annex had to cope with serious difficulties that are entirely removed from the founding of an Annex to Columbia. The students of the Harvard Annex are not permitted to gain a degree, but are obliged to content themselves with certificates. On the contrary, a graduate of the Columbia Annex would readily receive the degree of B.A., as the "Circular of Information for the Collegiate Course for Women at Columbia College, 1887-88," reads: "The degree of bachelor of arts will be conferred on such students as shall have pursued, during four years, a course of study fully equivalent to that for which the same degree is conferred in the School of Arts, and shall have passed all the examinations required." And, further, "any woman who shall have taken the degree of bachelor of arts in the collegiate course for women may study for *higher degrees* under the direction of the Faculty of the college." And for those who wish only to pursue some special studies: "To students not pursuing the full course required for the degree of bachelor of arts, but limiting themselves to one or more courses of inferior range, a certificate of proficiency in the subjects pursued will be given on the satisfactory completion of such course or courses of study, to be signed by the President of the college and the examining professor or professors."

In Cambridge they have an Annex and are praying for certain conditions that will insure its permanent existence and success. In New York we have the conditions that would bring permanent existence and success, *but we have no Annex.* "Where shall the scholar live?" says Longfellow. "In solitude or in society? In the green stillness of the country, where he can hear the heart of nature beat, or in the dark, gray city, where he can hear and feel the throbbing heart of man? I will make answer for him, and say, in the dark, gray city." In this "dark, gray city," this huge, growing, striding, ambitious city, with its many means of satisfying life's demands, there is one lack—the lack of a college where women may attain a complete education without leaving their homes and families. Ought we not, therefore, to begin at once to organize an association for the collegiate instruction of women by the professors and other instructors of Columbia College?

ANNIE NATHAN MEYER.

DAUDET'S 'THIRTY YEARS IN PARIS.'

PARIS, January 13, 1888.

I TRIED not long ago to give an analysis of the 'Journal des Goncourt,' and I insisted upon the difference between the social habits of the writers of the eighteenth century and of those of our own time. I showed how the Goncourts, though they belonged by birth to what is called society, always remained voluntarily out of society; how they shut themselves up, led solitary and contemplative lives; how, when they mixed with other men, they only cared to see writers, artists, devotees of the ideal. This spirit of seclusion, this divorce from the concrete realities of life, is exemplified again in a volume of memories, of biographical notes, just issued by Alphonse Daudet under the title of 'Trente ans de Paris.' This little volume is not a real biography—we have in it only glimpses of the past life of Daudet; but *ab uno disce omnes*, and the pictures which he gives us are so vivid, are so full of light and life, that it is impossible to form an incorrect opinion of the aim and character of the whole existence of the writer.

If, among our popular novelists of the present day, there is one who can be, in some senses, compared to Dickens, it is Alphonse Daudet. He has the same innate sympathy for all sufferers, for the weak, the humble, the victims of life; the same sense also of humor, though his irony deals with an entirely different class of people. For a Frenchman, he is almost a problem, for he combines in himself a strange northern sentimentalism with the most extraordinary comprehension of the "sunny South," of its candid vanity, of its childish gayety, of its impulsiveness, of its levity. Daudet is, at the same time, superficial and deep: he can suffer and he can laugh. The mystery of this double nature is probably to be found in his ancestors; but he tells us nothing about them, he only narrates in his first chapter his "arrival in Paris," the difficulties of his youth.

As soon as he left school, Daudet became what we call a *pion* in the little *collège* of Alais, in the Cévennes. The *pion* is not a teacher, he is the man who remains with the boys between the teachers' lessons and during the recesses; who eats with them and sleeps in the same dormitory. He is generally a very poor young man, who, for a miserable salary, finds in a *collège* the means of preparing himself for the examinations of the University. In the half-military, half-conventual character which the French Revolution and Napoleon gave to the French *collèges*, the poor, despised, unhappy, discontented *pion* took the place of the priest. The organization of the lyceums was an exact copy of the organization of the Jesuits' school; only they are lay schools, and the element of devotion to the child, of religious propagandism, has been suppressed. The child and the *pion* have become enemies, instead of being friends. You may perhaps have read Daudet's 'Le Petit Chose.' It is an exquisitely painful story, as it relates very exactly the sufferings of a *pion*. Daudet tells us, in his 'Trente ans de Paris':

"Yes, it was myself, this *Petit Chose*, obliged to gain a living at the age of sixteen, in this humble profession of a *pion*, and doing it in a distant province, in a country full of iron furnaces, which sent us rough little boys of the mountains, who insulted me in their brutal and hard mountain idiom. Delivered up to all the persecutions of these monsters, surrounded by hypocrites and brutes who despised me, I bore all the vulgar humiliations of the poor. No other sympathy, in this prison of sorrow, than the sympathy of the priest whom I have called the Abbé Germane, and the horrid 'Bamban,' whose queer little face, always dirty with ink or with mud, rises sadly before me while I write this."

Long after his stay at Alais, Daudet often woke up at night with his eyes full of tears, thinking that he was still a martyr. No wonder if he was anxious to leave Alais; but where could he go? To Paris? What would he do there? Paris is the great centre, the great luminary, which attracts all the butterflies of the country. Its very name is a promise; few young men have not felt like the young hero of Balzac who looks down on Paris from the height of Montmartre, and says: "À nous deux, maintenant." Alphonse Daudet had, fortunately for him, a brother who was already in Paris, living on a small salary. This brother sent for him, and offered him his hospitality.

The boy (for he was not yet a man, being only sixteen years old) travelled for two days in a third-class carriage, in winter, with light summer clothes. After he had paid for his ticket, he had only two francs in his pocket; he bought nothing on the way, and, towards the end of the journey, when the train was crossing the dull plains of Champagne, he nearly fainted. There were some gay sailors in his car who gave him some drink. He fell asleep, and only woke up in Paris. His brother was waiting for him, with a hand-cart and a commissionaire. "Where is your baggage?" Fine baggage indeed—a poor little old trunk, full of nails and mended in every corner. They started on foot, at the dawn of day, towards the Quartier Latin, walking behind the commis-

sionaire. Paris appeared to the poor and tired boy in its mysterious and almost awful matinal silence. "The gaslights were being extinguished; the streets, the Seine, its bridges, all seemed dark through the fog. . . . I kept near my brother; my heart was heavy within me, and I felt an involuntary terror." Then comes the description of the *crèmeries*, of the Rue Corneille, of the frugal breakfasts—"three sous' worth of coffee"; the first impressions produced by the Odéon, by the white marble statues of the Luxembourg Garden. "My brother was rich. He held the office of secretary to an old gentleman who dictated to him his memoirs at the price of 75 francs a month. We had to live on these 75 francs till we received the visit of Glory. We were together in the fifth story, in the Rue de Tournon, hôtel du Sénat."

How amusing is the description of the colonies of students, especially the students from Gascony, from the "sunny South"—noisy, turbulent, incessant singers and talkers. We meet among them Gambetta. "He was already the man whom we have known and admired. Happy to live, happy to talk, a loquacious Roman on a Gaulish stalk, he made himself drunk with his own speeches, shook the windows with his thundering eloquence, and ended generally in great fits of laughter. He was already a king among his comrades, especially as he received from Cahors 300 francs a month—an enormous sum for a student of those times."

Daudet had no turn for politics, as many of his friends had; he was completely absorbed in literature. He tells amusingly the history of his first trials. The office of a publisher was the Mecca of his aspirations. I wonder, even now, how he ever found one, with his poetical look of an Italian *pifferaro*. Even now he wears his long and curly hair parted in the middle, and looks thoroughly Italian, like the men of the Roman Campagna whom you meet on the steps of the Trinità del Monte. At the age of twenty he must have looked exactly like the models who are found in all the studios. His brother was his Providence, and helped him to make his way. He found a publisher in the Quartier Latin, named Tardieu, who published his first book of poems, 'Les Amoureuses.' He was a man of letters.

We could wish Daudet had given us the history of his relations with his publishers, but he jumps from Tardieu to Villemessant, editor of the famous *Figaro*, and gives a description of him. He tells us also the story of his first dress-coat, and of the visit he made in it to Augustine Brohan, one of the best actresses of the time at the Théâtre-Français. This visit was his début in the world. His acquaintance with the world was continued in a few literary salons. First, we have a charming picture of old Mme. Ancelot, now forgotten, but once the queen of a salon. "Nothing admonishes her. Everything gets old and faded round her—the roses of the carpet, the silk of the hangings, the memories, and the people; and while the century goes on, this life which is stopped, this home of another age fixed like a boat at anchor, sink silently into the past." Sometimes Mme. Ancelot asked Daudet to recite some verses. "Louder, louder," said she, "M. de la Rochejaquelein does not hear." She did not hear herself.

Daudet's readers will be interested in his "History of my Books." He makes us acquainted with the man who became the type of his 'Tambourinaire,' with the real Tartarin de Tarascon, and with the history of its publication. We learn what I may call the genesis of the charming volume 'Lettres de mon moulin,' written in the little domain of Montauban, on the road to Arles, where Daudet stayed at various times in order to cure himself, as he says, of Paris and to breathe the perfumed air of his dear Provence. We have also the genesis of 'Jack,' one of his best stories. We see the real Jack, such as he knew him, and learn his real adventures. We follow him from his infancy to the Hospital of Algiers, where he died; for Daudet never creates any types without having a model—his imagination is always helped by his memory. All Paris knows who were the principal characters in 'Le Nabab,' in the 'Rois en exil.' We have all recognized under their new names the men and women who have *sat* for him; and sometimes we have thought, also, that he has been too unmerciful, too ungenerous, that he has made too much use of persons who had been his friends or the protectors of his youth, that he has taken too many liberties with persons whom he had better have left in their solitude. In his 'Évangéliste,' for instance, he has, without sufficient evidence, tried to throw odium on certain religious persons; in the 'Rois en exil' he has mixed his palette in such a way that some irreproachable characters have come out in his work in false and odious colors. This excessive liberty, which borders sometimes almost on cruelty, is a consequence of the unsocial life of our modern writers of the Daudet type. Had he mingled more with the world and felt its useful pressure, he would have deprived himself perhaps of certain loud effects, but his work would have gained on the whole—he would have been nearer the truth.

AN EXEMPLARY ART CATALOGUE.

University College,
Liverpool, January, 1888.

Lovers of art in the present day enjoy facilities for study possessed by no previous generation. Not only are museums on every hand and of every kind increasing both in number and in accumulated wealth, but loan collections are continually being organized in all manner of places. The student who would take advantage of all the opportunities now offered him in different cities and countries, would have to travel with much persistence from place to place, and need not rest either summer or winter. This is perhaps possible to no single amateur. There must be many, not in America only, who were unable to see, for instance, the wonderful collections of the works of Reynolds, Gainsborough, and Van Dyck brought together in successive years at the Grosvenor Gallery, or the surprising collection of works of the English school during the last fifty years by which Manchester has recently gained so much prestige, not to mention a solid accumulation of pounds sterling. Unfortunately, these collections have to be dispersed almost as soon as they are brought together, and nothing remains but a bare list of names by which to measure the value of what one may not have seen. An illustrated catalogue was indeed published of the Reynolds collection, but the work was poorly done and failed of its purpose. With the means of illustration now at the disposal of publishers, it ought to be possible to publish (and sell) a really satisfactory memorial illustrated catalogue of every such collection, and these catalogues would in course of time assume a value and importance which it is difficult to overrate.

In 1886 there was an international exhibition at Edinburgh, noticeable among other things for being one of the few exhibitions productive of a compact profit. Needless to say, an art collection formed one of its most attractive features. This collection consisted entirely of French and Dutch pictures, one and all the outcome of the Romantic revival in France. It was formed chiefly if not entirely by the energy of one gentleman, himself the owner of many of the best examples shown, who had the discretion to prefer success in his undertaking to fame for himself, and whose name never appeared before the public at all. This collection attracted an unwonted amount of attention. It has now been made the subject of a memorial catalogue in every way worthy of its merits.

The volume,* besides possessing beauty and interest, is noticeable as a specimen of artistic production. It has been printed at the Edinburgh University Press, and is understood to be the first (or almost the first) of a series of artistic publications which may be looked for from the same quarter. Lovers of finely printed and illustrated books may be glad to have their attention called to this. The paper and printing of the catalogue are good. The title-page and initial letters are, to my thinking, a little out of harmony with the style of the rest. They resemble seventeenth-century work, while the type and proportion of letter-press and margin are visibly modern. The illustrations are excellent. They represent sixty-nine out of the one hundred and ninety-two numbers included in the catalogue. They consist of fifty-four outline sketches incorporated in the pages, and of fifteen etchings, of which one is by Mr. B. F. Blommers (after his own picture), the others by Hole or Zilken. The average of all the etchings is good; one or two are more than good. I may mention especially the charming interpretation of Corot's "Evening in Normandy."

The letter-press has been supplied by Mr. W. E. Henley, a writer widely known to specialists in this part of the world, but to the public chiefly as quondam editor of the *Magazine of Art*. No one, perhaps, would have been found possessed of a wider knowledge of the productions of the Romantic school, not in painting only, but in literature, drama, and all other branches. His introductory "Note on Romanticism" may be recommended to all who are interested in the Renascence of the nineteenth century; not that it actually formulates much direct information or criticism, but that, by implication and reference, it leaves upon the reader's mind a feeling of the mass and energy of the productivity of a great epoch. It is pregnant and suggestive—a brief dissertation which, read at the right time by the right man, might well decide the direction of a life's study.

More than this it is needless here to say. Some criticisms I would willingly add, but they would deal with matters of secondary importance, and could only be made interesting to the reader if prefaced, like the catalogue, with a dissertation upon Romanticism, written from another point of view. W. M. Conway.

Correspondence.

PROHIBITION AND HIGH LICENSE.

To the Editor of The Nation:

Sir: You have frequently advocated high license as a better practical means than prohibition for the suppression of intemperance. In the message of the Governor of Iowa, recently published, he says, "During the last year, and particularly during its latter half, there has been a decided falling off in penitentiary con-

* *Memorial Catalogue of the French and Dutch Loan Collection*, Edinburgh International Exhibition, 1886. Edinburgh: Printed at the University Press and published by David Douglas. 1888.

victs, and a very large number of county jails have been empty, some of them for the first time in years. There has been a marked improvement in the condition of our poorer people, especially in the families of laboring men addicted to strong drink."

Can a result like this be shown in the States which have adopted a system of high license?

W. A. N.

TERRE HAUTE, IND., January 17, 1888.

[We have lately quoted Bishop Ireland's statements about the effect of the new High-License Law in Minnesota. He says it has greatly reduced drunkenness and disorder, increased the bank deposits of the Polish and other of the poorer classes of people, and that in "many of the smaller places drunkenness has disappeared altogether."

In Illinois, high license has reduced the number of saloons from 13,000 to 9,000, and under the provision of the law which permits any municipality to increase the tax to any limit it pleases, or to refuse all licenses whatever, by a majority vote of its citizens, prohibition has not only been decreed, but is enforced over two-thirds of the soil of the State. In the cities it has greatly restricted the number of saloons, and has perceptibly decreased drunkenness and crime.

In Ohio, where a tax law prevails, levying only $200 on each saloon, 2,088 saloons have been closed because of the tax, 517 more have been closed by votes of town councils, and in 200 towns prohibition is enforced under a local-option clause.

Similar results have been obtained by high-license laws in Michigan, Missouri, and Nebraska, as we have repeatedly pointed out. In Missouri and Michigan, separate local-option laws have been adopted, which have given a larger portion of the rural sections of the State absolute prohibition. In fact, it is the almost invariable practice in States adopting high-license or tax laws to proceed naturally to supplementary local-option laws. The two working together accomplish the most satisfactory results. High license restricts and regulates the liquor traffic in the cities, and local option secures prohibition in the smaller towns and villages. In each case the remedy adopted is supported by the public sentiment of the community, and the consequence is that the law is enforced. A vital point, which prohibition advocates too often overlook, is that the principal struggle with the liquor evil is in the cities, not in the country districts. We do not know of a single instance in which high license has failed to restrict the traffic in cities, nor do we know of a single instance in which prohibition has succeeded in abolishing it there, or in doing more than to drive it into secret places, where its harm has been increased rather than diminished.—ED. NATION.]

HOW TO PROCURE GOVERNMENT PUBLICATIONS.

TO THE EDITOR OF THE NATION:

SIR: Will you inform me, and I imagine many others of your readers, how Government publications may be obtained without relying on the uncertain favor of one's Representative or Senator? Some time ago I wrote to the Government Printing Office for a pamphlet on State boundaries, published by the Geological Survey, remitting at the same time the advertised price, 10 cents. I never received the pamphlet.—Yours respectfully,

E. BRUNCKEN.

MILWAUKEE, WIS.

[A failure of the mail either way would account for our correspondent's disappointment. But a safe resort would be to Mr. J. H. Hickcox, 906 M. St., W., Washington, whose monthly priced 'Catalogue of U. S. Government Publications' ought to be accessible in every public library in the country. —ED. NATION.]

"THE CHEAP LIBRARIES AND ROYALTY COPYRIGHT."

TO THE EDITOR OF THE NATION:

SIR: Mr. Charles E. Taylor, in your issue of to-day, says that "one, and not the least, object of the 'League' is to put a stop to these unreasonably cheap editions of foreign authors," "the radical evil which it is the aim of true international copyright to uproot."

I should rather state the continuance of low-priced editions of reprints under the royalty system as a special advantage—

(1.) To authors. By the explicit and repeated statements of the most experienced publishers, they can sell *fifteen copies of a popular book at ten cents for one at a dollar.* This gives an author precisely *one-half more* copy-money on a low-priced than on a high-priced edition. Yet further, an American author whose sales have been exceeded by few, found that when the sales of certain full-priced books began to decline, the issue of cheap editions not only gave him copy-money on these cheap large issues, but also actually increased the sale of the library edition. Mr. Justin McCarthy was informed in Philadelphia by a most successful author in American history that, after buying two copies of Mr. McCarthy's 'History of Our Own Times' in cheap form, he had placed the bound library edition on his bookshelves, and that all the members of his college classes had purchased the low-priced issue. One of the dozen publishers of Mr. Haggard's 'She' sold 130,000 copies in cheap form, which at 10 per cent. royalty would have given the author nearly $3,000, while probably more of the library edition were bought than if the issue had been confined to the higher-priced style. No answer seems ever to have been made as to this statement of facts respecting the profit to authors of the sale of popular books at low prices. The author of 'Called Back' found a sale of 300,000 of his book before his death, because it was issued at a shilling.

There are classes of books, not popular with the masses, which, under royalty, as now, can only be issued in high-priced editions; and the authors, instead of a trifling honorarium, given as a favor involving personal obligations, would then receive their established tithes.

(2.) As to the public: The largest effort of the imagination can but faintly conceive the advantage, as well as delight, to scores of millions of students and toilers of small means of possessing books, "*their very own.*" Ten books at twelve or twenty-four cents (copy-money added) of the Franklin Square Library are worth to them nearly ten times as much as one book at a ten-fold price, just as ten pieces of plain bread are worth more than one piece of cake to men who cannot buy all the cake they want. The better paper and binding are unimportant to them, as compared with the very soul of the authors conveyed to them in their writings. Those who have passed much of their time in caring for the young can alone know their exquisite delight in the ownership of favorite books, and that a little library becomes a salvation to them from the allurements of gross temptations.

It must never be forgotten that in the advance of the cost of books by ten times, under a copyright of exclusive sale, seven-eighths of the net advance goes to the venders and one-eighth only to the authors. I cannot see any reason to believe that English publishers, who largely become owners of copyright books, would not place their reprints at the highest practicable prices in America.

Wrongly or rightly, our tariff takes a toll of 25 per cent. on the works of British authors brought here. The royalty system would not take one-fourth of their property away, but would probably double its present value. This is common sense and justice both for authors and readers.

If American authors have a lively competition, the secured British tithes should compensate them for this. Legislation should care for authors and readers, leaving publishers to adjust their system to the needs of their principals.—Respectfully, R. PEARSALL SMITH.

JANUARY 12, 1888.

[The desirability and advantage of cheap books, the proper division of the profits made upon the sale of a book between its author and its publisher, and the righteousness of the royalty-copyright scheme which Mr. Smith advocates, are entirely distinct questions. And it does not follow because the enactment of his pet plan would, as he claims, insure cheap books, that the royalty-copyright legislation proposed is either right or expedient. The United States has witnessed the questionable extension of legislation in many directions, but we have as yet no example of an act establishing, for the moral right inherent in one person, a different kind of legal protection from that granted to secure the exercise of the very same right by another person in the same community. Nor has the exceptional legislation interfering with the natural laws of trade, so as to influence the amount of profit which might accrue to the producer of any special article, ever received the sanction of thoughtful people.

As regards cheap books, they, as well as everything else which goes to add to the pleasure and dignity of human life, may be sold *too cheap.* Whenever a book is sold at a price which does not allow to every person who is a factor in its production an equitable payment for his share of the mental or physical labor involved—that book is too cheap. Books may be too cheap from another point of view. Mr. Smith would put the price of a good book down to the cost of a cigar. But we conceive that if a book is to make a lasting impression upon the mind of its reader, there must go more self-denial into the act of making it his "very own" than is called for by the sacrifice of a single cigar. Mr. Smith admits that not all books are popular, and that only those of established popularity would come within the operation of his plan. He names two very good examples of the kind of books (and they are the only kind) which would be widely sold under a system of enforced cheap reprints. But the distribution

to "scores of millions of students and toilers of small means" of ten-cent editions of books like Mr. Haggard's 'She' and Mr. Conway's 'Called Back,' in order to save them from the "allurements of gross temptations," seems much on a par with a mother's endeavor to keep her darlings out of mischief by an unlimited supply of sweetmeats. The following words from one of the great writers of English literature may be recommended to Mr. Smith's thoughtful perusal: "Life being very short, and the quiet hours of it few, we ought to waste none of them in reading valueless books; and valuable books should, in a civilized country, be within the reach of every one, printed in excellent form, for a *just price;* but not in any vile, vulgar, or, by reason of smallness of type, physically injurious form, at a *vile price.* For we none of us need many books."—Ed. Nation.]

THE RATE OF WAGES.

To the Editor of The Nation:

Sir: Your comments on the letter of "H. D. C." in the *Nation* of January 12 seem to leave untouched, except by implication, the vital fallacy in people's minds regarding the relation of the rate of wages to the question of reduction of the tariff.

Like "H. D. C.," many people, believing on *à priori* grounds in the advantages of a reduced tariff, fear that such a reduction can only be accomplished by a corresponding reduction in the rate of wages. The fallacy seems to be that they assume as true that the higher the rate of wages the greater is the cost of product. You pointed out that foreign competition does not bring English wages down to the level of German, French, and Belgian wages, which are as much lower than English as ours are higher; but you gave no explanation of how that is possible. The truth seems to be that the cost of the product depends just as little on the rate of wages, *leaving out of account the amount of the product of those wages*, as the speed of a horse depends on the time he is running, without regard to the distance he covers. If the cost of the product depended on the rate of wages only, the farmer would get the paupers and the imbeciles to work for him, and yet every one knows that the farmer who pays enough to secure competent and intelligent labor need have no fear from the competition of his neighbor who employs incompetent laborers at a less rate.

On turning to vol. xx. of the U. S. Census of 1880, we find it full of illustrations of the correct principle. In certain glass works in the United States the average price of labor was in 1860 $1.22 per day, and in 1880 $1.63¼, and, therefore, under the popular fallacy, the manufacturer of 1880 could not possibly compete with the one of 1860; and yet we see the cost of the same grade of tumblers, which in 1840 was $1.50 to $1.25 a dozen, only 25 cents to 35 cents per dozen in 1880. That is, with increased rates of wages we may still have a cheaper product. Again, in 1860, the average wages in a certain well-established axe factory were $1.75 a day and in 1880 $2.25, and yet the axes cost $11 a dozen in 1860, and only $8.50 in 1880.

In other words, with higher rates of wages, we may, with improved processes, better and cheaper raw material, and more skilful labor, have a cheaper and yet better product. For example, what with better sand, the natural gas, and the better class of mechanics in Pittsburgh, Pa., as compared with Belgium, we might see (had we the soda ash free of duty) American glass, made by better-paid laborers, exported to Belgium at a profit. Nor is this so very improbable. Mr. Edward Atkinson, who has made a special study of the subject lately, tells us that the wheat-farm laborers in Rhenish Prussia, a most prosperous part of Germany, are paid from $4 to $6 a month and their board, and poor enough board at that, while in Dakota we pay the regular laborers $25 a month, and temporary laborers $2 a day and their board; and yet the cost of producing the wheat in Rhenish Prussia, not including interest on the land, is 80 cents per bushel and only 40 cents in Dakota. It is nearly the same thing with pork, and we actually find both France and Germany, with their cheap labor, putting a high duty on American wheat and pork to protect themselves from the product of our labor that is more highly paid.

The question then comes to this, Is the product of American labor relatively enough greater than that of European to enable us to compete and yet to pay the higher wages? Statistics necessary to prove the exact ratios probably cannot ever be got with sufficient accuracy, considering all the difficulties in the way, to prove this beyond a doubt; but it is to be remarked that in looking over the exports of the United States we find that though we cannot compete, with our present tariff, in the raw materials, which require but little labor, yet, as we put more and more labor into these materials, and make agricultural tools, pianos, carriages, chemicals, and medicines, machinery, firearms, locks, refined sugar, and the like, we are able to export them with profit, and in direct competition with the cheaper labor of the Old World. Another indication of our power to maintain higher wages than the other countries is, that if the total yearly product of the United States is divided among our laborers, it gives to each laborer more than the total product of England or the Continental countries, divided up, gives to each of their laborers. If, then, the American laborer produces more per head, why may it not be possible that we can afford to pay him a higher rate of wages in open competition?

R. H. Dana.

Boston, January 17, 1888.

DR. ELY AND THE LABOR QUESTION.

To the Editor of The Nation:

Sir: Believing with you that the lasting solution of the labor question is to be got by each man doing justice to his work, by putting his heart into it, and by trying more to give value received than by worrying about all due, I am moved to send you the following item:

At the Illinois State Teachers' meeting, held in Springfield December 28–30, Dr. R. T. Ely of Johns Hopkins read a lecture on "The Teacher and the Labor Question." Anything more profitless could scarcely be devised. The good he said has been published over and again in a score of school journals for months past; as for the rest, it was pure twaddle. The lecture was far inferior to much that has been published on the subject, and contained absolutely no new light. Now, if he did not know that his talk was stale, his ignorance should detract somewhat from the value of his writings; if he did, then by what right does he denounce workmen who want long-time pay for short-hour work? For he received $150 for his effort. It looks very much as if the Doctor had symptoms of the striker's complaint—something for nothing.

Yours, Frank M. Drew.

Genoa, Ill., January 14, 1888.

MORE OF BLAINE'S "SURPLUSAGE."

To the Editor of The Nation:

Sir: As an interesting illustration, though on a comparatively small scale, of Mr. Blaine's ideas as to the disposal of the surplus, the scheme to obtain from Congress an indefinitely large appropriation to make a good harbor for vessels and larger yachts at Bar Harbor, Me., deserves a prominent publicity.

The plan, which originated with Mr. Blaine, and which, I understand, is now being urged at Washington by his lieutenant, Mr. Hale, is to connect with the shore an island which is nearly a mile distant from it at the nearest point, the depth of water between being at high tide not less than seventy feet for the greater part of the way, and at the shallowest, save when one small reef comes to the surface, twenty-five or thirty feet. The bottom, moreover, shelves seaward, and the exposure is to the full force of every storm. When this herculean labor has got well under way, Mr. Blaine has announced his intention of getting a further appropriation made for the removal of the bar which gives its name to the town, a bar hundreds of feet wide and thousands of feet long.

The alleged reason for the enormous outlay these schemes would necessitate is to make a naval station for training ships and ships of war, but for this Bar Harbor is ill-fitted both by the severity of its winters and by the gayety of its summers, while good harbors of Nature's making, with quieter seas and quieter seasons, abound upon the whole New England coast.

That local trade would be benefited by the creation of a first-class harbor is doubtless sure, and the measure would certainly find favor in Mr. Hale's neighboring home of Ellsworth; but why the country at large should be taxed for such a purpose it would be difficult even for Mr. Blaine to satisfactorily explain. That some explanation or justification of the scheme should be given, however, is made doubly desirable for the friends of these two statesmen, who have been made the subject of occasional unkindly criticisms, by the fact that they both are landowners at Bar Harbor, and might therefore be suspected by the uncharitable of being influenced by personal considerations.

One must allow, however, in common justice to Mr. Blaine, that his brain is certainly a very fertile one, and that if he had but the management of affairs, there would never be danger to the community from an accumulation of the surplus.—I remain, yours very truly, B.

Boston, January 16, 1888.

DARWIN ON CLASSICAL STUDIES.

To the Editor of The Nation:

Sir: The letter of your correspondent "H. T. P." in the *Nation* of January 12 must have occasioned a good deal of surprise. Mr. Darwin is quoted as entirely opposed to classical studies, and his opinion of the classics as a means of education is brought forward as "particularly interesting and valuable just now, on account of the rabid criticism directed against the liberal and progressive policy of Harvard University."

All this is very surprising, for reasons disclosed in your correspondent's own representation of the facts. Mr. Darwin is quoted as recording the fact that "nothing could have been worse for the development of *my* mind than Dr. Butler's school, *as it was strictly classical.*" "*No mathematics* or *modern languages*" is noted as the *chief omissions* (the italics are mine). Now, I submit that the foregoing makes a very poor case against the classics. No classicist of sense or culture has proposed throughout the discus-

sions of the past twenty years to offer a course of study that shall be "strictly classical"; nor should the friends of classical study be held responsible for the unwisdom of the old English cathedral schools, with their heavy mediævalism. In an ordinary school course nowadays, of the range and scope of the old Shrewsbury school, about seventy hours a week are devoted to recitations, and, of these seventy hours, only some thirty hours are devoted to the classics. So far, therefore, as the allotment of hours is concerned, your correspondent has upset only his own straw man.

But this is a minor point as compared with the following: Your correspondent's only witness is Mr. Charles Darwin—a man destined by Providence (I suppose) for a thousand years as the world's foremost scientist. Rightly, then, does Mr. Darwin say, "Nothing could have been worse for *my mind* than Dr. Butler's school." But minds like Mr. Darwin's are manifestly not the sort of minds educators are trying to treat and train. How absurd it would have seemed to your zealous correspondent had some classicist summoned as his only witness Dr. Arnold, Prof. Curtius, or Prof. Hadley. How much value would attach to the testimony of any one of these witnesses had he stated that he had attended ——— school, whose course of study was "strictly" scientific, and that nothing could have been worse for the development of his mind than Dr. ———'s School! In the interest of truth and sobriety in a serious educational question, I submit that your correspondent is guilty of a glaring *non-sequitur*. The whole question, Mr. Editor, of the rightful place and use of the languages and literatures of Greece and Rome calls for a finer spirit and a truer deliberation than are revealed by such deliverances as this I have been examining.

The "modernists," having fought a righteous fight and won a pronounced victory in favor of more science and more modern languages in our schemes of education, should now have a care lest, from being the persecuted, they should now emerge as the persecutors. It is indeed much to be feared that their own epithets "rabid" and "bigoted" may soon be applied to themselves with manifest pertinency. X.

TRAINING FOR THE REASONING FACULTIES.

To the Editor of The Nation:

Sir: If you ask me what early training will most strengthen and develop the observing and reasoning faculties, I answer, "A close and rigid classical education, extending through both school and college."

If you ask me how I prove this, I answer, "By the early education and subsequent scientific life of Charles Darwin."

If you ask me where this proof can be conveniently found, I answer, "In the letter of your correspondent 'H. T. P.,' *Nation*, January 12, 1888, p. 29."—Respectfully, etc.,

C. C. N.

Washington, D. C., January, 1888.

STATE NOMENCLATURE.

To the Editor of The Nation:

Sir: When considering the possibility of the passage by Congress of an act enabling the Territory of Washington to form a State government, the desirability of the change of name from Washington to some name of local or other appropriate significance should be recognized. Aside from the confusion of the possible State with the national capital, the present confusion of Washington and Wyoming Territories, arising from the precise similarity of the abbreviations used for each, W. T., is not inconsiderable. Letters for one Territory not uncommonly go astray to the other, and news from places in Washington Territory is very often printed in Eastern papers as from places in Wyoming Ty. which do not exist. The arrival of a certain ship at Port Townsend, Wyoming Ty., was once announced in an Eastern paper. Whether the dropping of the designation Territory from Washington would entirely overcome this confusion is a question.

H.

Cambridge, Mass., January 20, 1888.

Notes.

The new American Folk-Lore Society met at Harvard College on January 4, and took organic shape. Its object was defined to be the study of folk-lore in general; and in particular, North American collection and publication. Its membership is open to those who pay $3 in advance on January 1 of each year. It will hold an annual meeting by appointment of the Council. Its organ will be a scientific journal, sent free to every member, and whose first number will, it is hoped, be published in April, by Houghton, Mifflin & Co., with a quarterly appearance thereafter. Prof. F. J. Child of Harvard was chosen President. The Acting Secretary is Mr. W. W. Newell of Cambridge, Mass., to whom intending members should address themselves. The list already printed in the circular before us is a remarkable collection of names eminent in American literature and scholarship, and any one might well wish to find himself in such good company.

The fifth and sixth annual reports of the Managing Committee of the American School of Classical Studies at Athens (1885-87) are united and put under one cover. We read of one young lady (A. M., Mich. Univ.) as among the students of 1885-86, who devoted herself to the temple remains of Eleusis. Excavations during the period in question were made of the theatre at Thoricus, on the southeastern coast of Attica, and of the theatre of Sicyon, northwest of Corinth. Of these we shall hear later in detail. The home of the school has been built on land given by the Government, Dr. Charles Waldstein has been secured as permanent Director, and a strenuous effort is now making for a permanent endowment.

Scholarships to bear the name of the late Archbishop Trench are to be established in Alexandra College, Dublin, and an appeal is made for American coöperation in this memorial foundation. Subscriptions should be sent to Macmillan & Co., 112 Fourth Avenue, New York.

Ginn & Co. promise in April an 'Introduction to the Study of the Middle Ages, A. D. 378-814,' by Ephraim Emerton, Professor of History in Harvard University.

T. Y. Crowell & Co. will publish next month 'Napoleon and the Russian Campaign,' by Count L. N. Tolstoi, with a well-engraved portrait of the author after the least satisfactory original which has yet fallen under our notice. It has been badly engraved before.

Houghton, Mifflin & Co. issue at once 'The Second Son,' by Mrs. Oliphant and Mr. T. B. Aldrich; 'A Masque, and Other Poems,' by Dr. S. Weir Mitchell; 'Beyond the Shadow, and Other Poems,' by Stuart Sterne; and a two-story volume by Bret Harte, containing "A Phyllis of the Sierras" and "A Drift from Redwood Camp."

This being the season of the year for new ventures in periodicals, we are to expect next month the weekly *Garden and Forest*, a journal of horticulture, landscape art, and forestry, under the general control of Prof. C. S. Sargent of Harvard, as we have already given notice. Its publication office is in the *Tribune* building. Also, about the same time, will appear the *Publishing World*, an illustrated monthly literary newspaper, undertaken by the Brinckerhoff Printing & Publishing Co. at No. 771 Broadway. Mr. Hugh Craig will be the editor. *Outing* has again changed hands, and is henceforth to be conducted by Mr. J. H. Worman, editor of the *Daily Saratogian*.

The first number of the *Lincolnshire Notes and Queries*, a quarterly journal devoted to the antiquities, parochial records, family history, traditions, customs, folk-lore, etc., of the county, is before us (Horncastle, Eng.: W. K. Morton). The editors are Ernest L. Grange, M.A., and the Rev. J. Clare Hudson, M.A. The typography is very tasteful, and the contents pointed and entertaining. We observe in the partial list of subscribers but one American—the Boston Public Library; but many individual Bostonians might well occur on it, considering the relations of Lincolnshire to the Bay Settlement. A folding facsimile of a protection granted by Charles I. in 1643 is the sole illustration of the present number.

In the present month there is to appear at Oporto a new *Mensageiro Litterario*, a review with a European bibliographical section, as well as a scientific and a literary. The publisher, J. J. de Mesquita Pimentel, aims at something different from any existing publication in Spain, Portugal, or Brazil.

In the December number of *Le Livre* M. L. Derôme has something learned and valuable (as we expect of this writer) to say concerning the ups and downs in the reputation of Charles Perrault, best remembered by what is a minor title to remembrance, his 'Contes des Fées.' As a favorite officer of Colbert's, a superintendent of royal construction under Louis XIV., author of the colonnade of the Louvre, founder of the Académie des Inscriptions and of the Académie des Sciences, member of the Académie Française, whose receptions (beginning with his own) he first made public, besides introducing the secret ballot, he left enduring traces of his originality and force of character. In many ways he was ahead of his time, as in bespeaking for France a uniform system of weights and measures, and in contending against the humanists by insisting on the greatness of the moderns, as in his famous 'Parallèle des anciens et des modernes,' his critical judgments having since been fully ratified. On this point M. Derôme dwells at length, and urges a collective edition of his works. To Perrault and not to Scarron belongs the couplet describing the shadowy coachman in Hades who,

> ". . . tenant l'ombre d'une brosse,
> Nettoyait l'ombre d'un carrosse."

Some interesting facts about the family of Rabelais are also to be found in this number of *Le Livre*, with the announcement that an exhibition of caricatures is to be held in Paris during the present year.

The *Revue des Deux Mondes*, in the number for January 1, announces that there will appear in its pages during the coming year papers by M. Renan, "Les Règnes de David et de Salomon"; M. Taine, "Le Passage de la République à l'Empire"; and "La Conquête de l'Algérie," by an Academician less widely known than the other two, M. Camille Rousset, whose previous

work on the same subject, 'Les Commencements d'une Conquête,' published a few months ago, first appeared as separate articles in the pages of the *Revue*. M. Renan's papers on the reigns of David and of Solomon will continue the story of his 'Peuple d'Israël' from the point where the published volume ends far enough into the next one to give as vivid an impression of that as the long passage previously published by the *Revue*, "Saül et David," gave of the earlier one. M. Taine's promised papers, like his "Napoléon Bonaparte" in the numbers for February 15 and March 1 last year, will be a portion of the forthcoming volumes on the Empire in his great work, 'Les Origines de la France contemporaine.' Three other Academicians are also announced to contribute in a lighter vein to the *Revue des Deux Mondes* during the present year: M. Victor Cherbuliez, with "La Vocation du Comte Ghislain"; M. Octave Feuillet, with "Un Artiste"; M. Ludovic Halévy, with a story which has been talked of for more than a year, "Blanches Couronnes."

No. 2 of vol. x of the *American Journal of Mathematics*, lately received, reminds us that we have not yet noticed No. 1 of the same volume, received some time ago. That number was adorned with a very fine full-page portrait of Prof. J. J. Sylvester, well worthy of being framed and hung up in the library of every mathematician. The shape of the massive head is completely exposed, since it is almost entirely devoid of hair, and the stamp of profound, absorbing, and yet quiet thought appears in every lineament of the strongly marked countenance. Another feature of these two numbers of the *Journal* is the more than ordinarily extensive use of geometrical figures to illustrate the text. One of the articles in the first number has six figures in the text, and a paper in No. 2, entitled "Forms of Non-Singular Quintic Curves," is supplemented by twelve quarto pages, containing forty-seven figures. The fourteen papers contained in these two numbers are evenly divided between European and American writers, including among the latter Prof. Young of University College, Toronto, Canada. Of the contents of these papers we can only say that those who have made, or who intend to make, mathematics the principal study of their lives, will find them of the highest interest; to all others they will be unintelligible.

The pictorial supplement of the *Art Age* for January is a very competent etching by Mr. Hamilton Hamilton after Mr. F. D. Millet's spirited painting "The Click of the Latch"—a young wife, with beaming face, looking out of the cottage window to greet her husband.

George Bell & Sons, London, have published a fluent English translation by May Herbert of 'Schumann's Early Letters.' There is of course an introduction by Sir George Grove (an English musical work without a preface by Grove would be an anomaly), and the editor points out with satisfaction the esteem in which Schumann is held in England to-day, as compared with the neglect of former times. The letters were reviewed at length in the *Nation* when they first appeared in Germany. They are of interest even to non-musical readers who like to look into the workshops of genius.

The prettiest book which has come out of England for a long while is 'Aucassin and Nicolete,' done into English by Andrew Lang (London: David Nutt; New York: Scribner & Welford). It is a reproduction of the form and spirit of the best Elzevirs. There is an etched title-page by Mr. P. Jacomb Hood, who has also adorned the tiny volume with exquisitely delicate and appropriate head-bands and tail-pieces. The paper is Japanese, tough and supple and rich-toned. The printing has been done at the Chiswick Press; the modest rubrication is especially to be commended. The whole book, inside and outside, is a testimony to the taste and learning of the editor-translator. His rendering of the *chante-fable* is idiomatic and felicitous, with at least a suggestion of antiquated quaintness. The style, as Mr. Lang tells us, "if not Old English, is at least English which is elderly, with a memory of Malory."

The first folio of Shakspere, which is of inestimable value to the student of the text, has been brought within the reach of every one by the photographic facsimile which has been made of it in a reduced octavo size ('The Works of William Shakspere in a reduced facsimile, from the famous first Folio Edition of 1623. With an introduction by J. O. Halliwell-Phillipps.' New York: Funk & Wagnalls, 1887). Mr. Halliwell-Phillipps's Introduction is very short, and contains nothing noticeable. When we remember that an average copy of the original brings £500, and a good copy has sold as high as £714, the use of photography in multiplying the volume for the "poor scholar" is something to be thankful for. We observe, also, two new reprints by the same means in the Shakspere-Quarto Series, the "Richard II." of 1634 (the Fifth Quarto) and the "Famous Victories of Henry the Fifth," 1598, which, though not Shaksperian, is important enough as the predecessor of Shakspere's play on the same subject to be included, and is thought to contain the germ of the comic elements which he developed.

Cassell's National Library swells its second volume with Selden's 'Table Talk,' Defoe's 'Essay upon Projects,' and another instalment of Pepys.

Sensible and humorous is Mrs. A. M. Diaz's 'Bybury to Beacon Street' (Boston: D. Lothrop Co.). The villagers of Bybury are supposed to meet together, and to talk and write about their experiences, as well as to discuss various subjects. We hear also from the busy Beacon Street woman, whose days are as painfully subdivided by the conflicting claims of home, society, charity, and shopping, as poor Mrs. Lammerkin's of Bybury by those of cooking, sewing, baby-tending, etc., which all seem to require attention at once. Amusing as well as distressing are the stories of their tormented hours. Sunlight in the house, simplicity in dress and diet, self-respect instead of the worship of wealth and fashion, education of women in skilled labor, are among the things Mrs. Diaz advocates by the mouths of her speakers. These and other topics are touched with the bright insight and penetrating common sense which are the worst enemies of stupidity and folly. The social lump needs plenty of such leaven. We hope that both in city and country the book will be widely read.

Books on housekeeping and connected subjects abound. Harper & Bros. offer us Juliet Corson's 'Family Living on $500 a Year; a Daily Reference-Book for Young Housekeepers,' based on a series of articles which appeared in *Harper's Bazar*. This is food-economist, cook-book, and instructor in table service all in one. The discouragement which might come to an ordinary housekeeper through realizing from its contents what an amount and variety of knowledge it is possible and desirable to have on such matters, is handsomely offset by the enlightenment and suggestions it affords. Not the least attractive of the thirty-six chapters are those which contain bills of fare. One has, however, a feeling that to practise the economy here indicated, and at the same time to follow out all the ideas in regard to table variety, would entirely absorb time, strength, and vitality. Moreover, the amount of spicing and frying required does not exactly accord with some hygienic considerations. However, the book is a capital one, and every housekeeper should feel grateful to the able and painstaking author.

Still another work on household matters is 'The Biddy Club,' by Griffith A. Nicholas (Chicago: A. C. McClurg & Co.). Despite the undignified title and informal opening, the gist of it is very serious advice upon housekeeping questions, especially the treatment of domestics. It is the careful effort of some earnest well-wisher to both mistress and servant to teach the former how, by fulfilling her own duties, she may develop capacity in the latter. It is daring in its ideals, but full of admirable suggestion. It emphasizes strongly the duty of treating servants with kindly consideration as well as the strictest honor, and has also the conspicuous merit of showing how American women should face the dragon of domestic service, instead of cowering before it, as is often assumed must be done.

An interesting supplement to the grand "Édition Nationale" of Victor Hugo has just been issued in Paris uniform with that most sumptuous publication. It is devoted to the costumes of "La Esmeralda," the opera-libretto Hugo wrote for Mlle. Bertin in 1836, and it contains fifteen colored plates after the water-colors of Louis Boulanger, a facsimile of an engraving by Celestin Nanteuil of the scene of the first act, a facsimile of the "poster" of the first performance, a selection from Mlle. Bertin's score, and a preface by M. Charles Nuitter, the learned archivist of the Opéra. (Paris: Testard; New York: F. W. Christern.)

Part 18 of the 'Geschichte der Deutschen Kunst' (Westermann) continues the narrative of German painting. Part 19 introduces the section on Art Industry. The colored and other plates and the cuts interspersed with the text are, as usual, abundant and of a high order.

—Mr. Lowell's poem stands first in interest in the February *Atlantic*, not only for its author's sake, but intrinsically. It is a long poem and difficult in its matter; the style, too, is exalted; but though readers who are not familiarized with the language of verse at once condensed and elevated may find the first reading hard, the meaning and the beauty of the poem will yield, as we have discovered for ourselves, to repeated perusal. The author himself anticipates criticism by calling the lines "a mystical comment on Titian's 'Sacred and Profane Love.'" There is no reference to these pictures in the poem, which uses the myth of Endymion for its allegory. It describes the growth and changes and typical moods of love for woman from the youth's white ideal to the man's passion for possession, and afterwards, ending with the affirmation of the three-fold nature of his object of desire as "queen of my heaven—queen, too, of my earth and hell." The lines which express the youth's first impulses of awe and worship, his maiden fancies, are especially beautiful; but the characteristic of the poem is its nobleness. This slight analysis and suggestion are all we can give, but we hope they may serve to prevent some natural discouragement in those who may be disposed to think that the poem "entertains of too hard matter." The other contents of the magazine are almost entirely literary, which is a matter for congratulation. There is much fiction, much poetry, and much criticism. Mr. Lathrop's article upon George Meredith is better than is usual from his pen, and though one observes a good deal of

"hedging" by means of over-praise, it is a paper which helps to clear the air about this latest idol of "the cult." Mr. Lawton's essay on the "Medea" has many excellences, and Mr. Perkins's sketch of Madame Necker is entertaining history. The view of the state of European law on the subject of civil and religious marriage, which is the only other topic we have space to mention, is interesting in its subject, and seems to be exhaustive and trustworthy; it is a chapter in social development, rather than a technical inquiry.

— *Harper's* has a good deal that is of interest in politics. Senator Edmunds replies to Henry Watterson, on the protective side of the tariff argument, but he contributes nothing new to the discussion, except perhaps his opinion that the tax on whiskey does not affect its consumption. He is followed by Osborne Howes, jr., who writes of our shipping interests, and advocates a free-trade basis, on which alone they can flourish, either by taking off duties or by allowing drawbacks, together with the necessary change in the registration laws. His argument is simple, straightforward, and business-like. There is a cognate paper on the various ship-railways, with maps, now undertaken or proposed in Canada, about the Lake States, in Florida, and in Mexico; and a sketch is given of the Athenian ship-railway at Corinth, and of the feat of the Venetians in transporting a navy to Lake Garda in the Middle Ages. The Socialistic agitation in England is very instructively treated by J. H. Rosny. He does not enter into the right and wrong of the matter, but he illustrates the methods of the propagandism of the theory by the London groups, and shows the state of affairs, the actual look of the situation, very effectively as well as in an entertaining way by reporting the conversation in an English barroom and the scenes in Victoria Park where the orators hold forth. The sketches which illustrate this paper are very spirited. The West is the subject of some frontier reminiscences by Gen. Marcy in his exploring days before the war, and of an historical paper by Edmund Kirke on Robertson's colony in Tennessee in 1780. Quebec is described and illustrated in the usual way, and Mr. Howells has a paper on Villeneuve and its environs, in which he amuses himself with destroying the Byronic myth of Bonnivard, whom he draws in his own manner, and makes very agreeable if less statuesque. Art is represented by Felix Buhot's works, and Mr. Henry James contributes the fresh fiction of the number.

—The condition of our negro population is the subject of a Washington letter in the *Frankfurter Zeitung* of December 24, 1887. The writer's view of their social status is correct enough, but he is rather at sea in his historical retrospect, as when he says that the South was, at one time, more opposed to slavery than was the North, and that the civil war was a struggle between "the sons of slave-owners and the planters to whom their fathers had sold their dark commodities." This is a corollary to the misleading statement that "in 1790 the negroes were distributed throughout the country, and were almost exclusively slaves," but that "during the first quarter of the century, the inhabitants of the Northern States gradually sold their slaves to the South, where climate and the nature of the agricultural products increased the value of negro labor"—all of which sounds as if this countryman of Von Holst had drawn his facts from the pro-slavery pamphlets of Buchanan's Administration. The results of his observation, however, are better than those of his reading, and his opinion of the mental capacity of the negroes, as shown since the war, and of their possibilities of mental and physical progress, is decidedly favorable. He comments in detail on instances of race prejudice in both Northern and Southern States, and is especially struck by the fact that while the marriage of a white with a black involves ostracism from all society, miscegenation without marriage not only is visited with no social or legal penalties, but is so common that, exclusive of field hands, the color of at least half of the negroes is tinged with white. Add to this that while the negro women are industrious and willing to sacrifice themselves for the good of their children, the men rarely have any respect for the bonds of marriage, and, if married at all, are frequently several times bigamists, and the moral future can hardly be deemed promising. It appears that a German-American journalist has predicted that, in 1,000 years, there will be neither whites nor blacks in this country, but only "colored" people. The probability of this the correspondent does not deem it necessary to discuss, since "in 1,000 years there will very likely no longer be any United States."

—A writer in a recent number of the Berlin *Gegenwart* gives some interesting information concerning the results of a somewhat novel educational experiment lately tried by the French Government. It appears that, as early as 1883, Jules Ferry was persuaded to send a few young Frenchmen abroad at the public expense, to enable them to get a better knowledge of the German language. The first group sent out consisted of six persons chosen by a competitive examination in German from among twenty-five candidates for teachers' positions in the *écoles supérieures*. The Government stipend was fixed at 100 francs a month, exclusive of travelling expenses. In 1884, Fallières, then Minister of Instruction, decided to extend the privilege to graduates of the secondary schools, even though they did not propose to devote themselves to teaching, but to business. In defence of the idea, it was alleged that the graduate of the French schools had no practical command of German, and that this could only be gained by residence abroad. It was also urged that the stipendiaries would not only learn a foreign language thoroughly, but would also acquire some knowledge of the people among whom they should sojourn. As M. Bréal put it, "Ils n'apprennent pas seulement l'allemand et l'anglais, mais l'Allemagne et l'Angleterre." The argument seems to have been convincing, and the policy recommended has now apparently become a fixture. The annual expenditure for thirty stipendiaries is (the figures are for 1886) about 60,000 francs. Of these thirty, thirteen are sent to Germany and distributed among twelve different cities and nine different States. The proper distribution of the stipendiaries and the finding of homes for them are made the business of a committee of seven, of whom M. Bréal is at present chairman. The first report of this committee, to judge from the *Gegenwart's* description, presents the results of the new policy in a very rosy light. The stipendiaries not only without exception make good use of their time in learning German, but speak in warm and even enthusiastic terms of their life in Germany. They dwell upon the kindness of the German families in which they have lived, and upon the cordiality of their German fellow-students. "They all admit," says our authority, "that the art of instruction is more highly developed in Germany than in France; more attention is paid to the individuality of the learner, and the personality of the teacher counts for more." Only in drawing, it is observed, is the French training superior.

—One can hardly help speculating upon the results which may come from this policy if it be kept up uninterruptedly for a period of years. As every one knows, it is ignorance more than anything else which serves to keep national prejudice in an inflammable condition. The French have hitherto been famous for their lack of curiosity with regard to other peoples, and it is rather singular that they should be the first to adopt such a policy as that above described. But there can be no doubt that if the brief experience of the past few years offers any criterion, the policy cannot be otherwise than wholesome in its bearing upon the relations of France with Germany. Every French teacher, every French merchant, who has lived for two years among the Germans, will become a centre of influence and a source of accurate knowledge with regard to them. Thus light will gradually be let in upon many a dark place of superstition and prejudice. If the French people were really acquainted with things German, were even as well acquainted with them as the German people are with things French, it would be much more difficult than it is for the peace of Europe to be endangered by the sudden frenzy of the Parisian populace. That improvement in the teaching of German in French schools will result from this policy hardly admits of doubt; but whether, from a purely pedagogical point of view, the expenditure will really pay, is perhaps questionable. The sending of prospective teachers abroad is resorted to professedly because as pupils they have not been able in the French schools to learn to speak German. But will their own pupils fare any better? If practical command of a foreign tongue, that is, the ability to speak and write it easily, is to be regarded as the sole end and aim of instruction, then we fear that nothing will ever suffice except the transference of the entire class to foreign soil.

—It is cheering to read, on the title-page of a serious historical work, "twenty-fifth edition." This popularity, not often accorded to works of fiction, has been attained by Mr. Francis Parkman's 'Pioneers of France in the New World' (Boston: Little, Brown & Co.). The volume on our table bears not only the above legend, but this also—"revised, with additions." The revision begins with the original introduction (written twenty-three years ago this very month), which has been shortened; and what is noticeable, on a careful examination, is the author's overhauling of his style in minute particulars in a way very instructive as self-criticism. A recent visit to Florida has caused him to modify the local color of his former descriptions, and in harmony with this is a freer use of quaint citations from his sources, as in the case of Ribaut and Laudonnière especially. This leads to some expansion of the Florida narrative. The list of authorities has been enlarged, and among those of latest date Gaffarel's 'Histoire de la Floride Française' has proved most useful. We owe to it a new and pregnant ninth chapter, on Charles IX. and Philip II., in which the subsequent agent of the St. Bartholomew massacre appears in the more decent aspect of the King of all France making reclamations of Philip II. for the slaughter of Ribaut's Lutheran colony by Menendez. Whether he merely wished to save appearances or not, the redress sought was not vigorously demanded and was not accorded. Charles had assented to the colonization of Florida as proposed by Coligny, "not for the [Protestant] Faith, but for France":

"The enterprise, in fact, had a double character, political as well as religious. It was the reply of France, the most emphatic she had yet made, to the Papal bull which gave all the western hemisphere to Portugal and Spain; and, as if to point her answer, she sent, not Frenchmen only, but Protestant Frenchmen, to plant the fleur-de-lis on the shores of the New World."

The index of this improved edition has been greatly extended, as was desirable.

—The career of Savonarola may now be regarded as developed in the fullest light of historical research. The revised edition of Villari's 'Storia di Girolamo Savonarola' is at length completed with the appearance of the second volume, and bears evidence of the author's customary diligence in leaving nothing unexplored that throws light upon the subject. To the ordinary reader his careful analysis of contemporary testimony and the clear insight and eloquence of his exposition render the work attractive, while to the student it is indispensable. The generous dimensions of the Appendix of Documents enables the author to give *in extenso* all the more important papers connected with the life of the Frate. Those in the second volume are of especial interest, comprising all the official reports of the several trials to which Savonarola and his assistants were subjected. In addition we have, what is too often lacking in such works, a copious analytical index, occupying fifty pages. Yet even this does not exhaust all that can be said about Savonarola, for simultaneously there appears a second and enlarged edition of Gherardi's 'Nuovi Documenti e Studi.' The two works are in no sense rivals, for Villari's book is an historical biography in the best sense of the term, embodying a philosophical investigation into the factors which rendered possible such a career as Savonarola's, and made its catastrophe inevitable, while Gherardi's is not a history, but materials for history. It concerns itself principally with subsidiary points of interest, and illustrates how thoroughly Italian scholars have ransacked every accessible source of information on the subject. Among other matters we may mention an extended bibliography, comprising 212 articles, and including even an essay on the subject which appeared in *Scribner* in 1880. One of the important additions to this edition is a series of accounts of the expenses of the *Dieci di Balia*, from 1497 to 1499, by which we learn that the pile on which Savonarola was burnt cost 10 lire 17 soldi. In those evil days, wood was dear and human life was cheap.

—The fourth edition of 'Meyers Konversations-Lexikon' (New York: Westermann) gets through with the eighth volume and well along in the ninth in the parts which have recently come to hand. As usual, one sees everywhere marks of alert recognition of the latest authorities. Italy is the leading geographico-political article; Japan, also, fills a large space; the Jews and the Karls and the Church (*Kirche*) are the other leading titles. There are excellent maps of Italy, of Hamburg and Altona, Jerusalem, Cologne, Königsberg, Cairo and vicinity, etc. The European colonial possessions in Asia, Africa, and Oceanica are shown in comparative charts. The German colonies in Africa, on the eastern and western coasts, form a sort of triangle suggestive of easy transcontinental exploration between friendly stations. The plates of ceramics, beetles, and cactuses are beautifully executed in colors. The American portion is well cared for as far as it goes. Mr. Howells, while ranked below Hawthorne, is pronounced incontestably the first living American novelist. Mr. Henry James is not allowed to be second, for his name does not occur in the Lexikon, though Postmaster-General James is admitted. The artistic family of Hunt is likewise ignored, and the Jay family, in spite of its hereditary distinction. Gen. Greely, further, is missed, but the editor explains, in the *Korrespondenzblatt* on the cover, that due mention will be made of him under North Polar Exploration. Another correspondent is notified (and the fact may have a cis-Atlantic interest) that the collection of life masks made in 1879–'82 in the South Sea and the Malayan Archipelago by Dr. Otto Finsch, and numbering 164 pieces, may be had for $400, or a sample lot of six for $20. They are multiplied, colored, and sold at Castan's Panopticum in Berlin. Lovers of 'Uncle Remus' who enjoy Brer Fox's adventure with Cousin Wildcat, will find under *Katze* a graphic illustration of the difference between the latter's tracks when in a hurry and when proceeding stealthily, and will understand the success of Brer Rabbit's mystification. Finally, in the American group, we may fitly name the article devoted to the late Friedrich Kapp, whose historical works hold an honored place in our literature.

SIR STEPHEN DE VERE'S TRANSLATIONS FROM HORACE.

Translations from Horace, and a few Original Poems. By Sir Stephen E. de Vere, Bart. With Latin text. 2d ed., enlarged. London: George Bell & Sons.

GOETHE says that translators are like carriers who convey good wine to market, though it is apt to be very much watered on the way. It is not often that a translator devotes twenty-seven pages of preface to explaining his process of dilution, or to defending it in advance. This is, however, what Sir Stephen de Vere does; and the reader likes him the better for it; his admixture of the thinner element ceases to be a sin, and becomes at worst an error. He does precisely what he promises, and does it honestly; if the result is disastrous, it is his method, not his character, that is to be condemned. By Sir Stephen's own opening statement, in the preface, "No classical author is so difficult of translation as Horace." Fully recognizing this, his translator accepts also the dictum, which he quotes from Hallam, that, "in all translations, to represent the original character is the first duty." If, therefore, he fails, it is in an enterprise of conscious daring; if he attempts, in Boileau's phrase, to put lance in rest against his author's text (*jouster contre l'original*), he at least touches Bois-Guilbert's shield, for he not merely attempts to translate Horace, but he undertakes fearlessly the noblest and most difficult of the odes. If he fails to render them —and we think that this is the case—it is the result neither of negligence nor of weakness, but of a false theory.

Sir Stephen sets out with the assumption that Horace's condensation is "little in harmony with the English language or the usual current of English thought." The last clause of the sentence may be true, and if true it is of no consequence. The question is not of the usual current of thought or an unusual one; it concerns only the resources of a language. Longfellow found those resources adequate to the almost literal rendering of Dante into English verse; yet Dante is, among the moderns, the acknowledged master of compression. Sir Stephen de Vere ranks Horace in this respect with Tacitus: "He is the Tacitus of poetry" (p. xiv). But Emerson showed that Tacitus, in the hands of a master, not only required no dilution, but was susceptible of compression. Tacitus, explaining why the effigies of certain great men were not carried in a certain procession, wrote, "Eo magis præfulgebant quia non visebantur." Emerson, reducing six words to five, and fifteen syllables to seven, translated this sentence, "They glared through their absences." The moral is, that the difficulty of translating a highly condensed author may not lie wholly in the language, but in the man, and that although Horace may have many English translators—Miss Mitford says that "all gentlemen" amused themselves with that enterprise in her time—he will never be really rendered into English until he finds some one to deal with him as did Emerson with Tacitus or Longfellow with Dante. For his "curiosa felicitas," though by no means the whole of him, is yet so large a part of him as to be essential; a loose and flowing version, like that of Sir Stephen de Vere, may be very pleasant reading as a rhymed paraphrase, but a translation it is not. One might as well try to represent the 'Inferno' by a measure borrowed from the 'Lady of the Lake.'

Let us take, for instance, the well-known ode to Mæcenas, beginning "Tyrrhena regum progenies" (iii., 29). These three opening words are here thus translated:

> "Thou whose lineage springs
> From old Etruria's kings"

—eight words for three; and then there is added:

> "Come to my humble dwelling,"

which corresponds to nothing in the original, the invitation being there solely given by enumerating the delights that await the guest. These include the perfume for his locks, the very mention of these tresses coming lovingly from the poet:

> "Pressa tuis balanus capillis."

But this is only rendered,

> "And perfumes pressed from nard divine";

while the locks themselves, the only thing to explain the presence of "balanus," are left unmentioned. This is the double calamity of a loose and flowing translation; it not only inserts a great deal that is not in the original, but it always turns out to have omitted much that is there; it not merely amplifies but substitutes. The next lines yet further illustrate this inevitable evil. We can well praise the translator for condensing "Eripe te moræ" into "Haste!" but see how hopelessly the balance inclines against him in what follows:

> "Nec semper udum Tibur, et Æsulæ
> Declive contempleris arvum et
> Telegoni juga parricidæ."

This he translates,

> "Leave Tibur sparkling with its hundred rills;
> Forget the sunny slopes of Aesulae,
> And rugged peaks of Telegonian hills
> That frown defiance on the Tuscan Sea."

Here "semper udum" is hammered out into five words, and "Telegoni juga" into eleven; we have, outside of Horace, the sparkling rills, and the sunny slopes, and the rugged peaks, frowning defiance on the Tuscan Sea; we have a vast multiplication of syllables, and, after all, the "parricidæ" is ignored. So a few lines later he translates

> "beatæ
> Fumum et opes strepitumque Romæ,"

leaving out the significant "beatæ" and giving only

> "The smoke, the tumult, and the wealth of Rome."

In the next verse the whole sententious line,

> "Plerumque gratæ divitibus vices"

is left out, and the word *mundæ* is also omitted, thus losing sight of that cleanliness which is an essential attraction of the rustic meal described. There is no reference in the next

verse to the action of the sun in bringing on the sultry weather:

"Sole dies referente siccos."

In the next verse the translator needlessly substitutes "panting" for the simple weariness or languor of the flock (*grege languido*), and dilutes the terse

"caretque
Ripa vagis taciturna ventis,"

into a needless, though graceful amplitude,

"Where by mute margins voiceless waters creep
And the hushed zephyrs sleep."

Coming to the next verse, we find the whole structure of the ode altered by inserting a summons where none is given—

"Too long by civil cares opprest,
Snatch one interval of rest."

There is no such proposal; the poet has got far beyond direct appeal, and all the rest of the poem is a sweet and gracious philosophy, whose dignity is partly missed when the translator omits altogether the "prudens" by which the wise foresight of the deity is characterized; and he again weakens a condensed moral precept by expanding the simple

"Quod adest memento
Componere æquus"

into

"Wisely and justly guide thy present state,
Life's daily duty";

giving us ten feebler words for five strong ones. In the next verse the translator gives a note of tragedy quite beyond the key of Horace, by introducing "drowned men" among the things borne away upon the overflowing stream; while he omits altogether the delicately drawn contrast,

"fera diluvies quietos
Irritat amnes."

In the passage that follows—the most celebrated in the poem—the translator is at his best, and we gladly quote his version; he renders eight lines in eight, and with a fair degree of vigor:

"Blest is the man who dares to say,
'Lord of myself, I've lived to-day.
To-morrow let the Thunderer roll
Storm and thick darkness round the pole,
Or purest sunshine: what is past
Unchanged for evermore shall last.
Nor man, nor Jove's resistless sway
Can blot the record of one vanished day.'"

Later, "I praise her when she stays" is at least a pardonable expansion of "Laudo manentem"; and "Pauperiem sine dote" is even abbreviated into "Dowerless poverty"; but in the noble closing verse we have great diffuseness again, while yet there is a total omission of the local references which make all the scene so vivid, and neither the *Africis procellis* nor the *Ægæos tumultus* appears at all in the translation.

By thus tracing the method of Sir Stephen de Vere as applied throughout a single important ode, we are enabled to judge of it in all. He is graceful, sympathetic, and faithful, according to his own standard; but, after all, he works in stucco where Horace worked in marble.

THE CENTRAL-EUROPEAN REVOLUTIONS OF 1848-49.—II.

The Revolutionary Movement of 1848-49 in Italy, Austria-Hungary, and Germany. With some Examination of the Previous Thirty-three Years. By C. Edmund Maurice, author of 'The Lives of English Popular Leaders in the Middle Ages.' London: George Bell & Sons; New York: G. P. Putnam's Sons. 1887.

INCOMPARABLY greater, however, than in Italy or Germany was, in the spring of 1848—and after—the confusion in Austria. Vienna, after its honeymoon of freedom, was seething with revolutionary commotion. There were students' risings, laborers' riots, international wranglings, changes of Cabinet, Camarilla-conspiracies, and, finally, the flight of the Emperor Ferdinand to Olmütz. In Bohemia, the strife between German and Czech culminated in the gathering of a Slavic Congress in Prague, a senseless insurrection, and the bombardment of the city by Windischgrätz. Galicia was in a Polish revolutionary ferment. In southern Hungary the Serbs were rising against the Magyar revolutionary order of things created by Kossuth; the same was done by the Rumans and Saxons in Transylvania; and more ominous was the arming of the Croats under Ban Jellachich, against the authorities in Buda-Pesth and for the creation of a "triune" State—Croatia-Slavonia-Dalmatia. There was a perfect maze of movements and countermovements, of national schemes and plots; and the fury of the participants in them equalled the ferocity with which tyranny fights for its existence, or feudal reaction establishes its sway. Yet our author takes a most charitable view of all these popular strifes. He says:

"Though these divisions hindered the coöperation of the members of the different nations who might have worked together for freedom and progress, it should always be noted that the desire of each nation was, in the first instance, for the development of a free national life, connected with true culture and learning, and independent of mere officialism. If the Magyars were overbearing and tyrannical towards the Croats, it was partly because they believed that these divisions (the fault of which they attributed to the Croats) were tending to strengthen the hands of their common oppressors. If, on the other hand, the Croats appealed to the Emperor for protection against the Magyars, it was not from any courtier-like or slavish desire to strengthen the hands of despotism, but partly because they felt that the position of the Emperor enabled him to judge more fairly between the contending parties. . . ."

And thus "Tros Tyriusque mihi nullo discrimine agetur" has evidently been a leading maxim in writing this book. The sympathetic side of this impartiality we can only applaud. But there is another side to it, where it becomes excessive and unjust. (The author himself, as the Preface shows, felt the danger of becoming unfair from equal sympathy.) The Serbs and Croats, Rumans and Saxons, were surely struggling for their own national freedom when they demanded of Kossuth separatistic autonomies, and, on their demands being refused, immediately flew to arms, began a Vendean warfare against the Magyars, coöperated with the Imperial forces and finally with the invading army of Czar Nicholas, and stabbed Hungarian independence, and with it the democratic revolution of all Europe, to death. We can sympathize with all those secessionists of Hungary in their blindness, which made them restore, at the expense of streams of blood, the centralizing despotism of Metternich, under the more unscrupulous auspices of Haynaus and Bachs. But are Kossuth and his friends, who had just broken the yoke of Metternich and feudalism for all Austria, and by parliamentary means conquered constitutional freedom and civil rights for all its divisions and races, to be so severely inveighed against as they are by our author, for not yielding to demands for miniature autonomies which, as they firmly believed (and correctly, *we* think) could but lead to a speedy breaking up of their country into small fragments—for the benefit of Russia alone? Were not the Slovaks in the northwest and the Ruthenes in the northeast soon to come forth with demands like those of their Slavic brethren in the south? Were not the former gravitating towards a union with the Bohemians, and the latter with the Little-Russians of the Czar? Would not the Rumans of Transylvania have joined those in Moldavia and Wallachia, and the Serbs of the Banat become annexed by the Servian Principality? Was not Croatia granted real national autonomy, only short of independence? Could a thousand lines of national demarcation be drawn in every direction, so as to prevent incessant strife and ultimate chaos? Nor ought it to be forgotten, in judging the claims of "the Magyars," that this term covers not only six million Magyars by blood, but also three or four million ardently sympathizing fellow-citizens of different races—northern Slavs, Germans, Jews, Armenians, and others—in one word, nearly two-thirds of all the inhabitants of the Hungarian realm.

We can hardly doubt that the omitting of a clear exhibition of the relative strength and importance of the contending camps considerably impaired the historian's own perspective. In the same way we find that his avoidance of all references to authorities caused a dangerous laxity in examining, and looseness in stating, facts. We must say that we have never met with a more shocking perversion of a public act by a decent writer than the following statement perpetrates (p. 441): "On the 8th of October [1848] Kossuth issued an order to the towns of Hungary, in which he told them that any one that did not hang out the Hungarian flag, and express in writing his devotion to the Hungarian cause, and his willingness to obey the committee appointed by the Government, should be shot as a traitor." This "savage proclamation"—a mild expression, if we consider that it virtually condemned to death millions of Slavs, Rumans, and Saxons—existed only in the brains of some anti-Magyar informants of our author. Had he looked for more authentic authorities, he would easily have discovered that the order was issued only to the *fortresses* of Hungary, and threatened only their *commanders*—about a dozen men—and only in case they would neither hoist the Hungarian tricolor, in place of the black-yellow flag of Austria, nor surrender their commands to officers loyal to the Constitution. (The proclamation can be found in the *Kossuth Hirlapja* of October 13, 1848, and abstracts of it in every extensive history of the Hungarian Revolution, such as Bishop Horváth's or Irányi and Chassin's. Not one such, however, was consulted by Mr. Maurice, as his list of "Authorities" shows.) This defamation of Kossuth, into which the historian has been betrayed in part by his charitable desire to extenuate the fury of the opponents of the Magyar cause, demands a public retraction.

Nor is it the only involuntary injustice done that cause in painting its prominent defenders. They are largely, though not chiefly, wronged by omissions. There is no allusion to the wonderful organizing activity displayed by Kossuth throughout the desperate contest, nor a mention of even the principal battlefields on which the valor of his *honvéds* shone. And not only are Szolnok, Kápolna, Nagy-Sarló, etc., unnamed, but the whole strategic history of the war is wanting. Even the capture of Buda is not stated, though its siege is spoken of. In fact, almost everything in this history referring to warlike events is either very defective or barely allusive. We may instance the events in Posen, Schleswig-Holstein, and Baden, and the Novara campaign. The principal exception is Garibaldi's defence of Rome. It was, perhaps, the author's intention not to include military actions in the picture of the 'Revolutionary Movement of 1848-'49'; but, if so, he ought to have stated it. By far the fullest and most satisfactory parts of the work are the introductory chapters, treating of the period of Metternich's sway, and the narratives of the Italian revolution—though not done *sine ira et*

studio. Radetzky is painted as black as Haynau, "the tiger of Brescia." The portrait of Mazzini exhibits no blemish. Metternich and Charles Albert are very fairly depicted, and the Emperors Francis and Ferdinand kindly treated, while Frederick William IV. and most German actors appear only in pale outlines. Altogether German affairs do not receive their due share of attention. Every page of the book, however, bespeaks the writer's earnestness, humane sympathies, and love of political righteousness. And the whole of it is vigorously written.

The list of "Authorities Consulted" teems with misprints in German words; in the main parts we find "einen Kammer" (p. 308), "Izstein" (repeatedly for Itzstein), and a few similar inaccuracies. On page 14 we find: "On June 18, 1816, the students of the University met to celebrate the anniversary of the battle of Leipzig"—which was fought in October; p. 39: "February, 1822," for February, 1821; p. 49: "Ibrahim, the Pasha of Egypt," for Ibrahim Pasha, the son (or adopted son) of Mehemet Ali of Egypt. The county assemblies of Hungary were not convened "once a year" (p. 74), but four times. It was not in the "sevententh century" but in the sixteenth that Transylvania "separated for a time from Hungary" (p. 110). The movement attributed to "Maria Theresa about 1731" (p. 115) is probably referable to 1741, the second year of her reign. Chancellor Apponyi was not directed by Metternich "to supersede the Hungarian County Assemblies by administrators appointed by himself" (p. 201), but to have them presided over by such officials. The statement that in 1847 the Hungarian House of Magnates "called upon the Lower House to limit themselves to votes of thanks," etc. (p. 203), is almost absurdly loose. On pp. 242 and 243 "Archduke Maximilian," or "Maximilian," is, by a kind of aphasia, three times used in a story of Archduke Albert, instead of this latter name. "Voyvodeschaft" (p. 282) is a mongrel form for Voivodship. Karajitch (or "Karadziç"), who died in 1864, did not contribute to the development of Serb literature "during the latter part of the eighteenth century" (p. 283). Neusatz is not a "town of Slavonia" (p. 284). The Emperor Ferdinand's second flight from Vienna was not "to Innspruck" (p. 393), but to Olmütz. To say that Bem distinguished himself as artillery commander "at the battle of Ostrolenka," and "also commanded . . . in the insurrection of 1830" (p. 394), is like saying that Grant distinguished himself at Vicksburg, and also commanded in the Civil War. "March 7," on p. 416, stands for March 4. Charles Albert did not make his "final effort" against the Austrians "in April, 1849" (p.489), for he abdicated on the evening of his defeat at Novara, March 23. In justice to the author let us state that these flaws have been picked out of 500 large pages, densely filled with facts, and very attentively read, as they fully deserve to be.

GENERAL ORMSBY MITCHELL.—II.

Ormsby Macknight Mitchell, Astronomer and General. A Biographical Narrative. By his son, F. A. Mitchell. Crown 8vo, pp. viii, 392. Boston: Houghton, Mifflin & Co.

THE capture of Fort Donelson, the march on Nashville, Grant's movement to Pittsburgh Landing, Buell's to join him there, and the battle of Shiloh, all followed in the winter and early spring of 1862. Mitchell had shown himself a good commander of an advance guard, and when Buell left Nashville for the Shiloh and Corinth campaign, he intrusted to his subordinate the duty of covering Nashville and the left flank of the Grand Army under Halleck. It was the most important detached duty connected with the movement on Corinth, and the selection implied confidence in his capacity to exercise a quasi-independent command. He was expected to move southward from Murfreesboro to Fayetteville, with discretionary power to advance as far as Huntsville, Alabama. Upon hearing of the victory at Shiloh, he hastened his march and entered Huntsville on the 10th of April. His movement had been a vigorous one, and the results were important, though he had not been opposed by any considerable hostile force. Fifteen locomotives and eighty cars were captured, and Mitchell speedily sent detachments eastward to Stevenson and Bridgeport, and westward to Decatur, thus occupying about one hundred miles of the Memphis and Charleston Railroad. From Nashville, lines of railway went directly to Decatur and to Stevenson, forming a triangle, which, when some gaps were rebuilt which the enemy had made in their retreat, would make a system of communication of great strategic value. The southern side of this triangle was along the northern bank of the Tennessee River, which was crossed by no bridges except at the two ends of the piece of railroad which Mitchell now held, and this made the occupation and defence of southern Tennessee and northern Alabama safe and easy.

Mitchell telegraphed the result of his march to Nashville, whence it was forwarded to Washington, and his friends there secured his promotion to be Major-General, almost immediately, without waiting for the recommendation of his immediate superiors or any official knowledge of his achievement, except his own despatches. On the 17th of April he telegraphed a somewhat fuller report to the Secretary of War, assigning as a reason for it that he was uncertain whether his despatches reached General Buell. In this he says that he considers his line one of vast importance, and that a heavier force was needed upon it; but he does not inform the Secretary that the task assigned him was merely that of covering Nashville and the left flank of Halleck's army. On the 21st of April he telegraphed to Secretary Chase that he had spared the bridge over the Tennessee near Stevenson in the hope that he might be permitted to march on Chattanooga and Knoxville, but that he was now ordered to burn the bridges, adding significantly that he did not comprehend the order, but must obey it at once. He also said he thought the whole line of that railroad (the Memphis and Charleston) ought to be occupied, yet he feared it would be abandoned. This despatch Mr. Chase showed to the Secretary of War, who apparently showed it to Mr. Lincoln, and the President telegraphed Halleck to know what it meant. Halleck answered that Mitchell was not ordered to destroy railroad bridges, so far as he knew. Stanton then directed Mitchell to communicate daily with himself, saying that much interest was felt in his operations.

To a reader who knows anything of military subordination and discipline, the above outline only too plainly shows that Mitchell was discontented with the task assigned him, and made use of irregular methods of influencing the War Department to increase the importance of his command. The great end aimed at by Halleck was beyond all controversy the right one, *i. e.*, to attack and rout the Confederate Army under Beauregard; and he had united the forces of Grant's and Buell's departments for this purpose. Whether Halleck was as swift and vigorous in the execution of his plan as he should have been, is aside from the present inquiry. To have broken up his army into smaller columns would have violated every military rule, and it was perfectly right to keep Mitchell north of the Tennessee River and west of Stevenson till the principal object of the campaign should be achieved. For the subordinate part of the plan allotted to Mitchell, his forces were enough. But he wanted a larger field. The reason he gave for communicating directly with the War Department was not quite ingenuous. The telegraphic communication with Buell was not broken, and it was the easiest thing in the world to ask over the line whether his despatches were received. But his situation did not call for new instructions; those contained in Buell's letter of March 27 covered the ground, and that letter referred to conversational explanations already given.

This, however, is not the worst. The despatch to Chase of April 21 distinctly says he had "spared the Tennessee bridges near Stevenson" with the hope of a forward movement. This was misleading. He had himself burned a bridge beyond Stevenson more than a week before, and though it was not over the Tennessee, it had been burned to make his position defensively safe, and without orders from any one. To destroy the Bridgeport bridge, or one span of it, was only to accomplish this end a little more thoroughly. He had himself indicated that his own wish up to this time was to approach and coöperate with Halleck's army, and not to move in the opposite direction. It was not candid, therefore, to say to the Government, through channels aside from the military ones, that he did not understand the order as to the bridges, or to intimate that he had reason to fear a purpose to abandon that line of railroad. Had he told the Secretary of War in full what was the part of the general plan assigned to him, the matter would have been clear enough; but instead of doing this, he sent through Mr. Chase insinuations that there was no plan, or worse.

Mitchell's biographer thinks that in saying he was ordered to burn the bridges, he intended to include the great bridge at Decatur, the west end of the section of railroad which he held. If this were so, it would gravely add to his fault. Buell's letter was dated April 19, and contained the direction to destroy the Tennessee bridge east of Stevenson, "and also the Decatur bridge as soon as you should leave it." Mitchell could not have misapprehended the condition attached to this order. The correspondence makes it perfectly clear that one of the contingencies to be considered was that the enemy might drive him back upon Nashville, and in that event the Decatur bridge was to be burned. We should prefer not to believe that he could represent this as a peremptory order to burn that bridge.

Buell's order was explicit as to a bridge beyond Stevenson, and Mitchell had himself anticipated and justified it by burning one, though not the one which Buell indicated; that one the enemy burned a little later. But the Decatur bridge was a very important structure in the line leading directly towards Halleck's army where Buell was. To preserve this till he should be driven away from that part of the country was the plain dictate of common sense. Mitchell had urged Buell to have Tuscumbia occupied in force. This point was on the same railroad, and was reached from Huntsville by crossing the river at Decatur and running west, on the south side, some thirty or forty miles. Buell was under Halleck's orders, who thought Mitchell could hold it with an outpost. This irritated the latter, and was the occasion not only of his despatch to Chase, but of his writing to Buell a few days later, "As you attach little impor-

tance to the occupying of Tuscumbia and the south side of the river beyond Decatur, I have decided quietly to withdraw my troops to the north side of the river, and will then destroy the bridge." It were an easy thing (he did it in other cases) to have fortified the bridge-head on the south side. He was not driven away from it. No demonstration was made by the enemy at that point that was in the slightest degree formidable. He remained in possession of the road as far as Decatur (excepting the bridge) till Buell joined him in person after the occupation of Corinth. Yet by his correspondence with Mr. Chase and Mr. Stanton over the heads of his superiors, he impressed them with the belief that he was an able and vigorous general who was ordered to destroy the bridge by incompetent commanders. Halleck characterized it as a foolish act, and the official records do not sustain the biographer in the effort to shift the responsibility to Buell. The incontestable fact was, that Mitchell had not destroyed the Bridgeport bridge which Buell had directed to be burned, but had destroyed that at Decatur, which was only to be burned when he should leave the country which he did not leave.

Corinth having been taken, Grant was left there while Buell was ordered back into Tennessee. Halleck was soon promoted to be General-in-Chief at Washington. Buell was ordered to repair the Memphis Railroad to Mitchell's position and then to advance upon Chattanooga. Mitchell meanwhile kept up his direct correspondence both with Stanton and with Chase. On the 5th of June, in a letter which would seem to be in answer to one from Mitchell urging his transfer to some other field, Chase wrote, "You have done so much, you ought to be permitted to do more. If I could decide the question, you would come here at once, and be put where you could *do most*." The last words, underscored in the original, plainly point to the command of the Army of the Potomac. On June 21 Mitchell himself says to the Secretary of War by telegraph, "I respectfully solicit more active duty." Stanton replied that "the President regards the advance on east Tennessee as only second in importance to Richmond, and that you cannot be safely withdrawn from that field ; so that the Department cannot gratify your wishes."

Buell joined Mitchell at Huntsville on the 29th of June, and it is very difficult to separate the correspondence just referred to from Mitchell's tender of his resignation three or four days later. The situation was fully discussed between them, and Buell treated him with entire respect and regard, but did not give orders for an immediate movement in accordance with Mitchell's impetuous suggestions. Thereupon the latter telegraphed the Secretary of War as follows: "Finding it impossible to serve my country longer under my present commander, I have to-day forwarded, through him, my unconditional resignation, and respectfully solicit leave of absence for twenty days." The biographer tells us that Mitchell was ordered to report at Washington, whither he immediately went, but we are not informed whether he pressed the acceptance of his resignation ; at least it was not accepted. We are also told that the President intended for him the command of the Mississippi expedition which was given to McClernand, while Mr. Chase's memoirs show that he and Mr. Stanton urged Mitchell for the command in front of Washington, sending Pope to relieve McClellan on the James. It was at this point that Halleck was called to the capital, and Mitchell was not assigned to any command till September, when he was ordered to the Carolina coast. Just before this he had again thought of resigning, but wrote to a friend that it was opposed by so many high in power and influence that he deemed it his duty to refrain for the present.

It has now been definitely settled that Buell was rebuilding the Memphis Railroad by Halleck's orders, and Gen. Mitchell is himself witness to the fact that two months would be a small estimate for rebuilding the great bridge at Decatur which he had burned. Buell was, therefore, not responsible for this delay at the opening of the new campaign. He listened to Mitchell, but he did not explain to him what his own orders were ; he did not complain to his subordinate of Halleck, nor did he correspond with the Secretary of War directly or through Mr. Chase. Mitchell exploded in a resignation which was a damaging Parthian shot at his commander, and most damaging (it is due to truth to say it) because the former had a powerful influence gained and used by irregular means which the latter did not feel at liberty to use even in self-defence, for, in his justification to Halleck, he limited himself to asking that the President might be shown his despatch.

Buell's reticence was a marked characteristic of him as an officer, and he carried it to excess. In several points of his military career he suffered from it, because they with whom he was working adopted as a maxim that he who does not publish his plans has none. He said of himself in an early letter to McClellan: "I have not written you very frequently because I could not write definitely, and because such (perhaps exaggerated) importance do I attach to secrecy in these matters, that I have hesitated to put my own thoughts to paper." It would have been better if, in this case, he had been more communicative to Mitchell, however undeserving the latter. In judging of Mitchell's conduct, however, we must remember that he had in his hands the written evidence that Stanton, Chase, and other powerful men in the Government had almost unbounded confidence in his opinions, and that when he declared he could no longer serve his country under Buell, he was giving the latter as nearly a fatal blow as it is ever in the power of one man to give another. Nor did Mitchell stop here. When he reached Washington, he submitted to Mr. Stanton a plan of campaign understood to be that which he pressed upon Buell. It is now published by his biographer to show how superior it was to Buell's, though it is extremely open to criticism. Without discussing this, it is enough to say that it was intended to justify his unwillingness to remain with Buell, and therefore was condemnatory of the latter ; yet he did not feel called upon to supply Buell with a copy of it, or to give him any intimation that it had been written.

To the extent, therefore, that the President, the Secretary of War, and the Secretary of the Treasury had confidence in Mitchell, their minds were necessarily prejudiced against Buell without hearing him in his own defence. When Bragg moved from Chattanooga, this same influence had prepared the leading men of the Government to hold Buell responsible for the delay which was the result of Halleck's imperative orders. But, worst of all, when Buell had been relieved from command, the demand of Governor Morton that he should be sent before a military commission found these same great officers of the Government under this same prejudice thus created by his subordinate behind his back; and Halleck's real though timid and vacillating opposition to the demand, fell before it. It is, therefore, no injustice to Mitchell to say that he thus had, indirectly, a very large share in the Buell Commission, a proceeding which general public opinion is now rightly regarding as a disgraceful page in our military history.

Yet Mitchell did not profit by the injury he did another. The curious conjuncture of circumstances by which Mr. Lincoln was induced to make Halleck General-in-Chief, put the principal power of assigning officers to duty in the hands of one who looked upon Mitchell as insubordinate, over-ambitious, and intriguing. Besides this, Mitchell was made himself to feel the sting of having his conduct and his motives misconstrued. His whole life is guaranty enough for his personal honesty, yet he weakly allowed himself to assume a line of conduct in regard to the cotton trade which might easily be misinterpreted, and his habit of neglecting his military superiors in reporting, left him without the defence this would have given him. His morality was above reproach, yet some of his detachments were accused of outrages upon persons and property, which were made use of to damage his reputation for military discipline and for humanity. These things, combined with Halleck's evident distrust of him, turned the balance when it was a question of assigning him again to an important command, and he died a bitterly disappointed man.

It is rather late to draw a moral from the use of irregular and doubtful methods of influence in military matters during the war. Historical retrospect, however, is full of morals, and can hardly avoid pointing such lessons. The military rule that official communications must pass through the hands of immediate superiors has its best justification in such incidents as Mitchell's career discloses. The history also shows how likely great officers of the Administration are to do injustice when they encourage direct correspondence of subordinate military men with themselves. Mr. Chase was beyond question a patriotic man and an able Secretary of the Treasury; but through the whole war he cultivated the habit of corresponding with military officers and drawing from them criticisms of the military situation. He was a sort of godfather to a considerable number of generals, and reminded them of their obligations to him for appointment or promotion. Among his correspondents at different times were McDowell, McClellan, Rosecrans, Mitchell, Nelson, Rousseau, and Garfield; and this by no means exhausts the list. He was a powerful friend, and pushed the interests of his protégés, though his sense of public duty made him drop them if they failed of success in important commands. His error was that he based his judgment of their military ability too much upon their trenchant criticisms of others, or their suggestions of paper campaigns, rather than on their own performance. He befriended some able men, but he also did much injury to others by giving powerful effect to hostile suggestions of which the victims were ignorant.

It is almost demonstrably clear that this was the case as between Mitchell and Buell. Give to Mitchell every credit which can be claimed for his march to Huntsville, and the fact remains that he was a general who never saw a battle nor any considerable combat in the field. The opinion of Chase and of Stanton of his military capacity was chiefly based upon his letters of criticism and his ardently expressed desire for vigorous action. Yet these statesmen, on such evidence, did not hesitate to declare strongly their wish to intrust him with the command of the most important army, overlooking Grant, who had made a more daring march and had captured Fort Donelson with nearly twenty thousand prisoners; over-

looking Buell, who had led the Army of the Cumberland into the second day's fight at Shiloh with splendid ability; overlooking Thomas, who had gained the brilliant victory at Mill Springs. Robert Anderson, Sherman, and Buell in succession found their relations to the War Department made intolerable, and in each case it is now plain that Mitchell's correspondence and complaints had much to do with their embarrassments. When we add to this the fact that such criticism, made in ignorance of the other's real purposes, and listened to without hearing the other side, was sometimes sufficient for the condemnation of a commander in the field, we shall begin to suspect that the ultimate judgment of history will be that the blunders of the war were not confined to the generals.

The Health of Nations. A review of the works of Edwin Chadwick. By Benjamin Ward Richardson. 2 vols., 8vo. Longmans, Green & Co. 1887.

If the noblest study of mankind is man, one of the most fascinating branches of it is the effect on man of his environment, and one of the most beneficent forms of good works is to prepare and make straight those paths that lead to health, to wealth, and to happiness. Bred to the law, but scarcely to be called a practitioner of it, Mr. Edwin Chadwick, now eighty-eight years old, for more than sixty years has been a public economist of the most advanced and practical type. As a member of boards and commissions, and as an independent essayist, he has traversed nearly the entire social field, and his researches and conclusions on life insurance, on the relation of sickness to mortality, on general vital statistics, intemperance, education (especially as to methods and limitations among young children), upon roadways, sewerage, sanitary dwellings, epidemics, the prevention of crime, and, in fact, upon almost the whole round of civilized life, are of very great and lasting value. Although primarily prepared for English use, many of the facts and all of the reasoning so fairly meet the requirements of other countries that Dr. Richardson, himself an eminent sanitarian, is fully justified in entitling his review 'The Health of Nations.'

Into these two volumes the editor has compressed numerous and important papers with such condensation and critical comment that no further abstract within our limits is possible. The work has been well done, and, in the words of the preface, "the reader of the present day will be able to form an idea, not only of the changes which have taken place for good, but of those which still remain to be effected before the realization of the aspirations of our author have been fulfilled." But even as they stand, they form a wonderful record of the progress that has been made within the life of one man, largely due to that man.

The Ignoramuses. By Mrs. Schuyler Crowninshield. Boston: D. Lothrop Co.

The author of 'Among the Lighthouses' now offers a book which will be liked by readers young, but not too young, whose taste has not been spoiled by exciting literature. It tells a story of travel and sight-seeing in Germany and Switzerland. The subjects chosen are, as a rule, less hackneyed than usual; there is sufficient variety of incident and adventure, and very little wearisomeness of description. The narrative impresses one as if it were really true —the different characters standing out distinctly, and not seeming mere puppets set up to render instruction a shade less dry. Thus, while a good many desirable bits of information are gleaned as the story goes on, the interest is fairly divided between the scenes described and the persons supposed to be viewing them. One of the best-drawn characters is that of a perverse and conceited boy of sixteen, whose sayings and doings should be profitable reading to not a few young people who stand higher in their own esteem than in other people's. In brief, this one is a great improvement on most of the books of travel which have lately been written for youth. The engravings are not of even excellence, some being very effective, others very poor.

BOOKS OF THE WEEK.

Shakespeare in Fact and in Criticism.
By APPLETON MORGAN.
Descriptive Circular on application.
WILLIAM EVARTS BENJAMIN,
744 Broadway, New York.

GERMAN SIMPLIFIED.
SPANISH SIMPLIFIED.
The following will be found eminently practical for self-instruction: (1.) German Simplified—Complete in 12 numbers (with keys) $1.20. (2.) Spanish Simplified —from 10 to 12 numbers (with keys) 10 cts. each; No. 5 now ready; a new number on the first of every month; Sold by all booksellers. Sent, postpaid, on receipt of price, by Prof. A. Knoflach, 140 Nassau St., New York.

A Pleasant Winter Trip to the Tropics.
THE STEAMSHIPS OF THE RED "D" LINE.
Sailing every twelve days for Venezuela, S. A., and the Island of Curacoa, W. I., afford an unequalled opportunity to those wishing to make a short sea voyage to the tropics.
These American steamers, especially built for the trade, are provided with every modern appliance for the safety, convenience, and comfort of passengers. The round trip is made in four weeks, and costs but $144.
For descriptive pamphlet, apply to
BOULTON, BLISS & DALLETT,
General Managers, 71 Wall St., New York.

WINTER RESORT.
Persons wishing to winter in a mild, dry, piney-wood climate, and desiring the accommodations of a thoroughly well-appointed house, under Northern management, address THE HOBKIRK INN, Camden, South Carolina. Sixth season. Circulars.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 2, 1888.

The Week.

THE serious proposition which is made in the Chicago *Tribune* for such a modification of Mr. Blaine's tariff views, as embodied in his celebrated "Paris message," as will permit revenue-reform Republicans to rally again to his support, merits serious consideration. The propounder of the proposition leaves no doubt as to what he means. He puts it rather cautiously at first by saying that, with "one change, Mr. Blaine's plan would meet fully the present emergency." Then he advances a little, and suggests that, "on mature consideration, he (Blaine) would hardly include the repeal of the tobacco tax in his plan of tariff revision and reduction." This is coming close to the point, and, after a few more sentences of explanation and elucidation, the reader's mind is presumed to have been prepared to receive the full revelation without a shock, and out it comes, as follows: "Doubtless, on careful consideration, Mr. Blaine would strike out the words 'tobacco tax' and insert 'sugar tariff.'" Having once reached the point, the editor's language grows bolder with every sentence: "Mr. Blaine's reference to tobacco as a 'necessity of life,' the tax on which should be repealed, must have been a *lapsus linguæ*. The removal of the tobacco tax would not fit in nor harmonize with his general plan. *The sugar tariff must be what he meant.*" When he had reached this point, the editor's feelings were visibly much lighter. He went ahead with great ease and swiftness to show that, with the repeal of the sugar tax and an enlargement of the free list and a lowering of war duties, which are too high, a tariff reduction would be accomplished in accordance with the Republican national platform of 1884. Mr. Blaine was a candidate on that platform, and why should he not be a candidate again on a similar platform this year? asks the editor, and then answers his own question triumphantly as follows: "Mr. Blaine need only propose the repeal of the sugar instead of the tobacco tax, and he will have a method of tariff reduction to command the hearty approval of revenue-reform Republicans."

After this modification of the Paris message has been accomplished, there will be little difficulty with the other portions. The Chicago reviser points to the fact that Mr. Blaine declared, in one portion of his interview, that what he had said did not imply that there should be no reduction of the national revenue, but the "reverse," and claims that that is sufficient evidence that he is in favor of the reduction demanded by the revenue-reform Republicans. The remark, however, precedes in the message the response which he made when he was asked: "But what about the existing surplus?" That was: "The abstract of the President's message I have seen contains no reference to that point. I therefore make no comment further than to endorse Mr. Fred Grant's remark, that a surplus is always easier to handle than a deficit."

The conservative policy of the Ways and Means Committee in dealing with the tariff is shown in the reported reduction of the duty on copper from four cents per pound merely to two cents. The imposition of any duty whatever on an article of which we are large exporters to foreign countries is a swindle on its face. It serves simply to enable the producers to charge American consumers more than they charge foreign consumers for an American product. It is a fact well known to the trade that at one time the difference as against American consumers was so great that Calumet and Hecla copper was bought in London, imported to New York, and sold here in competition with Calumet and Hecla copper that had never crossed the ocean. The copper monopolists put a stop to this by buying up all of their own copper in foreign markets, and refusing to sell any except to foreign consumers. They had previously killed the copper-smelting works on the Atlantic seaboard by the shameful duty on copper ore, driving the laborers therein out of employment. There is or was an extensive copper-smelting establishment in the suburbs of Boston which was totally ruined by this villanous tariff on copper ore. It was treated by law as though it had been an establishment for the manufacture of counterfeit money. The making of copper in the United States by this process was simply prohibited. What made the matter peculiarly odious was that these seaboard smelting works used American ores in part, mixing them with foreign ores. When they were closed, the market for the American ores was gone, and a monopoly was thus given to those companies which, like the Calumet and Hecla, already had a great natural advantage in the production of the metal. The same tariff had the effect to destroy the manufacture of sheathing metal for ships' bottoms. The sheathing-metal men went to Congress year after year asking for relief, but they got none. All this was done by Congress under the same kind of a threat that the wool-growers are now mouthing—that if the duty on copper was not granted, the copper interest would join the free-traders and knock the whole tariff into flinders.

It is well known that there has been lately formed a "copper trust" on a world-wide scale in Paris. A few persons have combined to possess themselves of all the existing stocks of copper, and of a controlling interest in all the principal copper mines of Spain and Chili. The large American producers have been invited to "chip in," and have probably done so, although naturally they would not proclaim that fact on the housetops. The best evidence that they have taken a share in the French syndicate is found in the fact that the syndicate is able to carry its heavy load. It would not be able to do so if it were obliged to buy the output of the American mines at the advanced price, in addition to that of all the small mines and half-abandoned mines which are now becoming active under the new stimulus. This is certainly an appropriate occasion for reviving the copper-smelting industry that was so ruthlessly crushed in the year 1868. In any other country than ours, or in an earlier period of our country, the stoppage of copper-smelting by law would have been called a damage to American industry. Here it was called protection.

A contemptible piece of injustice to our importing merchants has been perpetrated in the Deficiency Bill. The common law, up to 1839, and the Federal statutes since 1845, have said that if a collector of customs exacts an illegal rate or amount of duty from an importer, the importer can bring a suit and have a judgment against the collector exacting it. The damages set forth in the verdict or judgment have ever been the same as in any other suit for "money had and received." Interest from the date of the illegal exaction has been computed at the rate in the State where the exaction was made, which in New York may be 7 or 6 per cent., and in California 10 or 8 per cent. Heretofore the Treasury has paid the judgment, including the interest computed by the jury or the court; but, on the advice of Secretary Fairchild, the Deficiency Bill, in appropriating money to pay these judgments, required the Treasury to separate, on judgments, principal from interest, and only pay 3 per cent. interest to an importer, although the legal rate might be twice as much, and the use of the money worth twice as much to the importer. And this, too, when the courts have said, and the Treasury agrees, that the collector was wrong in exacting the money. Mr. Evarts, Mr. Edmunds, and Mr. Sherman all denounced the legislation as indecent, unjust, and unconstitutional. Mr. Allison defended it chiefly because so many importers are aliens who only pay 2 per cent. interest on their manufacturing plant. (Where is that?) The vote on adopting the 3 per cent. clause was 25 yeas to 24 nays, 27 Senators being absent. An amendment was then adopted making it apply only to future cases.

The Senate the other day adopted a resolution referring the President's message on the Pacific railroads to a special committee instead of to the Judiciary Committee. The action was proper enough in itself, but there is food for thought in the following clear statement, by the Washington correspondent of the Springfield *Republican*, of certain considerations which entered into the decision: "It came out in the discussion in the Senate that some of the members of the Judiciary Committee wanted to get rid of the matter because they receive valuable fees from the Pacific roads as attorneys; and, while they are not willing

to renounce the fees, they apparently think it will appear a little more decent to have the matter go to another committee, and then quietly vote the right way when it comes before the Senate. Mr. Edmunds was one of those who strenuously urged that the subject be referred to a special committee."

The weakness of the whole plea for the passage of the Blair bill was clearly exposed by a question which Senator Dawes of Massachusetts put to its author during the latter's speech on Thursday. Mr. Blair had read a letter from somebody in Georgia complaining that the State did not appropriate money enough to provide sufficient schools, when Mr. Dawes asked, "Why does not the State pay more? It is a rich State." Mr. Blair could make no reply to this pointed question, and his inability to make a reply is the strongest argument which could be brought against his bill. As has heretofore been shown by us, the School Commissioner of Georgia demonstrated more than five years ago that an increase of the State tax, which could even then be made "without unduly burdening the people," would keep the schools open six months a year; and the only reason why this additional State tax has not been levied is because the people have been hoping to get the money from Washington. It is no wonder that candid people who formerly supported the scheme, have been persuaded to change their ground by such proofs of the way in which the bill promotes mendicancy. This change is coming to be reflected in the Senate, where Mr. Kenna of West Virginia, a Southern Democrat who voted for the bill before, now announces his intention to vote against it. Northern Republicans who are inclined to make a similar change need feel no doubt that public sentiment will sustain them, when they find a journal once so earnest in supporting the bill as the *Christian Union* now opposing it.

The Public Printing-Office has long been what the Bureau of Engraving used to be, a place in which Congressmen could conveniently quarter their dependents on the public treasury. The last Republican incumbent, Rounds, was kept in office two years under the present Administration, and then dismissed, and he has since died. His Democratic successor, Benedict, has begun very slowly to reduce his force, and has been dismissing a number of Republicans, which is, of course, causing much irritation among their "influences" in Congress, and they called on him for an explanation, and they did not like his explanation, and demanded that he be investigated. The investigation has been ordered, but has been made to cover Rounds's administration also, which has increased Republican irritation. But this irritation, though natural, is unreasonable. Nothing but good can come of an investigation of the manner in which the office has been managed by both parties. The investigation of the Bureau of Engraving did a world of good, and the report was one of the best civil-service-reform documents ever published. It showed that the office was so packed with supernumeraries forced in by Congressmen, that shelves had actually to be put up on which they could loaf, and doze, and be out of the way, during office hours. Doubtless there is a somewhat similar state of things in the Public Printing-Office.

The *Herald's* reporter in the Lehigh mining region supplies some facts regarding the condition of the strikers, who have now been "out" nearly five months. The picture is a deplorable one, but it might be worse. It would be worse, for example, if these men were in a place where good wages and plenty of work could not be had. But seeing that $2.62 per day average has been and is now offered to them, and that their rejection of it is quite voluntary, the sympathies of the humane are not likely to be greatly enlisted in their behalf, although we cannot fail to pity their children. A physician at Ashton is quoted as saying that the little ones "were in rags, and had neither shoes nor stockings. The wind drove snow through wide cracks in the poor shanties, which were not fit for human beings to live in. The children were not white-faced; it had passed beyond that point. They were blue-faced. There is terrible suffering among the miners now. They and their children are just beginning to feel the pangs of hunger. Very few of the little ones get enough to eat. If these strikes last much longer, death will come to the coal regions in a terrible form." Notwithstanding these self-inflicted sufferings, the reporter says that the miners are perfectly peaceable. They have committed no act of violence. They have not thought of destroying the company's property — blowing up the mines or anything of that sort. Noble forbearance, indeed, seeing that their interest in the property when they choose to work is by much the largest interest of all, and that if it were destroyed they would be out of a job not for five months only, but for all time. "They will see their wives and children die before their eyes," continues this sympathizing writer, "rather than give up what they regard as a struggle for manhood." This must be regarded as a slight exaggeration, judging from the great strike of 1877. Miners are not so greatly different from other people that they will see their wives and children die while $2.62 per day is dangling before their eyes; but they will come pretty near that condition. They cannot be far from it now, if this is a true picture.

Ex-Senator Warner Miller has, according to the Philadelphia *Press*, been making in an interview "a clear statement of the tariff issue, and a logical refutation of the fallacies put forth by the free-trade champions," filling a column and a half. What is new in it is an admission that our industries are no "longer infant industries," and that "only free-traders who desire to ridicule and break down our tariff system talk about our infant industries. The fact is, that the value of our manufactures is greater than that of England or any other country." He also added, when questioned about "free raw materials," that neither they nor anything else of the kind would do the American manufacturer any good as long as he had to pay such high wages as at present. All that was wanted to make this explanation complete was the amount of the high wages which the manufacturer gets back from the workingman in the sale of his goods under the high tariff. This should always accompany a statement of the rate of wages paid in this country, in order to reduce the free-traders to real confusion.

The nomination of Warmoth for Governor of Louisiana by the Republicans of that State indicates that the Republican party of the South has learned nothing in the past twenty years. Warmoth was elected to the Governorship in 1868, and his administration was one of the most disgraceful seen anywhere in the South during the whole reconstruction period. For the Republicans of Louisiana to renominate Warmoth in 1888 is the same thing as it would be for the Democrats of New York to propose Tweed's restoration to power if he were still alive. Northern people who wonder at the weakness of the Republican party in the South ought to have their eyes opened by such incidents as this.

One gets occasionally curious glimpses of the working of the Southern mind in the accounts of the "affrays" in that part of the country. Knoxville, Tenn., is a flourishing community, with all the outward appearance of high civilization, and yet here is what happened there on Sunday morning: The City Council elects the City Physician, but there is an ordinance which provides that he must be a graduate of a medical college; and in order to appoint a certain "Dr." West, who was not a graduate, the Council repealed this ordinance. The Knoxville *Journal* thereupon denounced the transaction in fitting terms through an article written by a local physician. West's son thereupon seems to have concluded, not that he must sue the editor, a Mr. Rule, but that he must shoot him with a pistol and stab him with a penknife. He went to his house to find him on Sunday morning, but, hearing he had gone to church, followed him to St. John's Episcopal Church, and called him back as he was entering the door with his wife. West and his brother and a friend of theirs then set upon Rule, knocked him down, one of them trying to shoot him in the head, and another operating on his back with a penknife. Most Christians here probably would suppose that when Mr. Rule went to church with his wife, he left his revolver at home. Not a bit of it. He had it quite handy in his pocket, and was expert with it, for he shot John West through the body, and Goodman, the friend, through the shoulder, and then William West ran away. The report concludes, grotesquely, with the remark: "The organ drowned the noise of the pistol shots."

Of all Sunday-school entertainments of which we have ever heard, the oddest was one given in the Warren Street Methodist Episcopal Church (Brooklyn) on Monday week, in the shape of a mock trial in a suit of breach of promise of marriage, brought by "Anatomy Comstock" against "Baby Brownspotter." "The young people who got up the exercise," we are told, "were evidently close observers of the recent Campbell-Arbuckle suit, or, as it is better known, the 'Baby Bunting' and 'Bunnie' trial. The large Sunday-school room was filled by an audience which included small children and the aged, and many came from other churches to see the novel entertainment." The pastor's daughter, "pretty Miss Florence Yarrow," was the leading witness, and "the plaintiff's counsel, wearing a full-dress suit and a gay boutonnière," "danced about the altar as he interposed objections." "Dancing about the altar" is good. Several of the witnesses were in fantastic costumes, and the court officer appeared with a blackened face, and "lambasted" the male witnesses with a stuffed club. The affair, however, was kept "within the limits of propriety," which means that its vulgarity was free from positive indecency. It would probably have been impossible to explain to the audience the unfitness of the whole thing. One of the advantages of being chromo-civilized is, that you can have lots of "innocent amusement" out of things which fill other people with disgust. These same believers, however, are probably very particular about making presents to the Pope.

Dr. Titus Munson Coan delivered a lecture on health at the Cooper Institute on Saturday, in which he warned people against going without overcoats in winter "like the Anglo-maniacs"; but he ought to have added that the Anglo-maniacs are not such fools as they seem, for their coatless condition in the street is apt to be a bit of imposture. They wear substitutes for overcoats underneath in the shape of waistcoats of some kind, which will not injure their figure. The Doctor also, in denouncing water as a frequent cause of disease, departed from that middle path in which, as the Latin poet says, true safety lies, because he laid it down that impure water slew more people than "rum or whiskey." This comparison was particularly odious and entirely unnecessary, because to tens of thousands it will operate as an argument, not for making sure that the water they drink is pure, but for taking rum and whiskey instead of water. All lecturers and authors who compare alcohol as either food or drink with other things, ought to keep in mind the tremendous bias of human nature in favor of rum or whiskey in these latitudes, and temper their arguments accordingly. The danger of impure water can be thoroughly exposed without tacitly recommending another dangerous drink as less dangerous, when it is generally easy to get pure water. Distilled water can be had in this city by any one who is afraid of the Croton, for five cents a gallon, delivered at his house, or he can distil it himself on his own fire for probably far less. Most people, especially the fat, would do well to reduce their consumption of fluids by at least two-thirds.

The prospect now is, that the new High-License Law in Pennsylvania will reduce the number of saloons in Philadelphia alone from 6,000 to less than 3,000. Applications for licenses for this year must all be filed before February 12, and up to the present time only a few more than 1,000 have been filed. The court clerks anticipate a much larger number during the few weeks remaining, but no estimate places the probable total higher than 3,000, and the most competent authorities say it will not go above 2,800. This would give the city a revenue of about $1,000,000. The greatest obstacle which the new law presents to the liquor-dealers is the requirement that each applicant shall have as bondsmen "two reputable freeholders of the ward or township," each of whom "must own unencumbered real estate worth over $2,000, and must not be engaged in the manufacture of liquor." No bondsman is allowed to sign more than one application. This requirement prevents the brewers from taking out licenses in the names of liquor-dealers, and is doing much more than the $500 license fee to reduce the number of saloons.

A recent statement in the Providence *Journal* shows the complete defiance of the prohibitory liquor law which is displayed by the saloon-keepers in the largest city of Rhode Island. Accurate statistics are given, by which it appears that there are 125 more places in the city where liquor is sold than there were under the former license law. There is no longer any pretence of secrecy made about the traffic. The saloons, which under the license law were always closed at midnight and were never open on Sundays, are now nearly all open twenty-four hours a day during a seven days' week, and many of them do their heaviest business on Sundays. There is apparently no effort whatever made to enforce the law, and there are no signs of a public protest against its nullification. The *Journal* also publishes information about the condition of affairs in some of the larger villages and towns of the State, showing that the law is no better enforced there. "Reference to the prohibitory law," says the *Journal*, "is treated in the same manner as the quoting of a popular slang phrase is, and mere allusion to the probability of any effort being made to enforce it is laughed at as something absurd." Rhode Island is, in short, having an experience with the free and untaxed sale of liquor.

One of the most curious phases of the transformation which the Republican party has been undergoing for some time past, is the difficulty which many of the organs find in adjusting themselves to the new relations which sprang up in 1884 between the organization and the "slums." The campaign of 1884 changed all that. For the first time in its history the Republican party then presented a candidate who repelled the support of those districts in the great cities most famous for the intelligence of the population. The Twenty-first Assembly District of New York is known as the Murray Hill district, and always used to be depended upon for a large Republican majority. In 1880 it gave Garfield 4,642 votes and Hancock only 3,533—a Republican plurality of 1,109; but in 1884 it gave Blaine only 4,080 votes to 4,641 for Cleveland—a Democratic plurality of 561. The First Ward of Brooklyn, which includes the Heights, represents the same sort of population and had a similar political record. In 1880 it gave Garfield 2,272 votes and Hancock only 1,725—a Republican plurality of 547; but in 1884 it gave Blaine only 1,736 votes and Cleveland 2,234—a Democratic plurality of 498. Wards 9, 10, and 11 of Boston include the Beacon Hill and Back Bay districts, and had always been "Republican strongholds." In 1880 they gave an aggregate of 4,072 votes for Garfield and only 1,805 for Hancock, the Republican vote being more than double the Democratic; in 1884 they gave Blaine only 2,918 votes and Cleveland 3,153, transforming the Republican plurality of 2,267 in 1880 into a Democratic plurality of 235 in 1884.

It is a well-known fact that when, on the evening of the last Presidential election, the returns came into the newspaper offices from such parts of New York as Murray Hill, and of Brooklyn as the Heights, it was conceded by all intelligent judges, who reasoned upon the basis of previous contests between the parties, that Cleveland must have carried New York State by a large plurality. When the Twenty-first Assembly District of New York reported that Cleveland had secured 561 plurality where Hancock was beaten by 1,109, and the First Ward of Brooklyn that Cleveland had 498 plurality where Hancock was beaten by 547, it was taken for granted that Blaine must be overwhelmingly beaten. But the Blaine men would not concede this. "Wait till you hear from the slums," they said, "and you will find that the Republican candidate has made great gains." It turned out as they had predicted. The First Ward of New York had given Garfield only 1,885 votes; it gave Blaine 2,275. The Fourth Ward had given Garfield only 1,543; it gave Blaine 2,390. The Second Ward had given Garfield only 1,146; it gave Blaine 2,130, or almost twice as many. It was the same way in Brooklyn, the Twelfth Ward, for instance, perhaps the "slum" ward *par excellence*, giving Garfield only 686 votes and Blaine 928. Moreover, it has always been claimed by the Blaine men that they lost many thousands of votes in the "slums" of New York and Brooklyn, which would otherwise have gone to their congenial candidate, through Mr. Burchard's famous remark. All this should teach Republican organs that the time has gone by for contemptuous references to the "slums," such as we find in an editorial article in the Cleveland *Leader*. The truth is, that the Republican editor who now talks in the old-fashioned strain of the "slums," is but little better than a Burchard himself.

AN IMPOSSIBLE CANDIDATE.

THE temporary recognition of Gov. Hill as a Presidential possibility is due to two causes: the first is his own pertinacity in thrusting himself forward as a candidate at every opportunity, and the second is the present dearth of topics to write about in the newspaper offices. Of actual standing as a candidate, the Governor has never had less than he has to-day. If he were to stop wire-pulling and intriguing, what is called his boom would disappear instantly. He has never had any following as a Presidential candidate outside New York State, and his following here is made up entirely of men who are dissatisfied with the President because he is too much of a reformer. This following is too weak to make a showing at the polls, or in any other way in which the popular voice gains expression; but every now and then it comes to the front in some kind of a committee contest. As the President refuses to meddle in such contests, the Governor, having no such scruples, has matters largely his own way, and he is usually able to make a sufficient show of strength to claim that if he is not stronger than the President in his own State, he is at least a rival.

Whenever he makes a demonstration of this kind, as he did last week, when he was able, after months of underground political manœuvring, to tie the Democratic State Committee upon the question of electing a member of the National Committee, the Blaine Republican press become fairly hilarious, and really outdo the late Butler organ, the *Sun*, in their eagerness to make the Governor the next Democratic nominee for the Presidency. At the same time the Governor himself hastens to assure everybody that there is no rivalry between himself and the President, that the best of feeling exists between them, and that these little contests are not any of his doings, but are the outcome of the irrepressible zeal of his enthusiastic followers. We presume that if the real truth were to come out about the Governor's scheming, it would be seen that he has little expectation of making himself a Presidential candidate in the near future, and is, in fact, only seeking to make his renomination for Governor sure.

It requires little acuteness of observation to see why the Blaine people are eager for Hill's Presidential candidacy. He represents in politics precisely the opposite of all that gives the President his great strength. The latter stands as the representative of courage, convictions, and high purposes in public life. The former is the best type now remaining of the Machine politician who utterly despises principle in politics, and trusts all to intrigue. It is impossible to imagine Gov. Hill vetoing the pension grab or issuing the tariff-reform message. He showed his contempt for such appeals to the intelligence and conscience of the people when he hastened to confer office upon Sterling, the liquor-dealer, whom the President caused to be kept out of a place in the Custom-house. Nobody knows better than the Blaine advocates what the effect of Hill's nomination would be upon the political standard of the next national campaign. It would lower the whole contest at once to the Blaine level of morality. It would produce precisely the situation which they desire, that is, a "choice of evils." There is no situation which they would prefer to that. They could then nominate their man with a hope of electing him, for they could say to the thousands of Republicans who now are prepared to vote for Cleveland in preference to Blaine: "Admitting that there are some things about our candidate which are objectionable, you cannot deny that he is a better man than Hill." Then, too, with Hill and Blaine in the field, the Independents and Mugwumps would "be out in the cold," for they would either have to "vote in the air" or not vote at all, and that, we need not say, is a contingency for which every good Blaine man is longing.

But there was never so little chance of its arriving as there is to-day. The country is not going to move backward in its political sentiment. Mr. Cleveland was nominated for the Presidency in 1884 because he had given promise of those higher qualities in public office of which he has since furnished most conclusive proof. The sentiment which forced his nomination then, and forced it upon an unwilling party, is not only a thousand times stronger to-day, but it has the willing support of an overwhelming majority of the Democratic party. No competent political observer can question these facts. There is not a State in the Union which shows the slightest disposition to send anything else than a Cleveland delegation to the next National Convention. If by indefatigable wire-pulling Gov. Hill were able to get control of the delegation from New York, it would do him no good. The voice of the rest of the country would overwhelm its vote and nominate Cleveland by acclamation.

A significant sign of this irresistible tendency of the party was furnished by the action of the Democratic State Committee of Massachusetts on Saturday last. It was only last September that the Democratic Convention of that State ventured to oppose the President's policy in their platform and candidate. The crushing defeat which they met at the polls in November showed them their error, and on Saturday they declared that the Democrats of the State were a "unit in their support of President Cleveland in the policy recommended by him in his last annual message to Congress"; that they "believe it to be the duty of Democrats throughout the United States to advocate, support, and insist upon the adoption of the principles enunciated therein as the great issue upon which the Democratic party, with its candidates in the approaching Presidential election, can achieve an overwhelming victory at the polls." That is a revelation of the new spirit which is behind the President in his own party. His course has given them what they have not had until now, enthusiasm for him as their leader, and they are not only willing, but eager, to renominate him.

"ROYALTY" COPYRIGHT AGAIN.

As stated in a prefatory note by the editor of the *North American Review*, it was Mr. Gladstone's suggestion that the English discussions of Mr. R. Pearsall Smith's copyright scheme should be followed by an expression of opinion from American authors. Accordingly we have, in the January number of the above journal, a restatement of the "royalty" proposal in an article entitled "Anglo-American Copyright," to which comments are appended. Mr. Smith's second paper, though said to contain his "most matured views" on this subject, seems to be but a rehash of his former contributions, with nothing new added either by way of argument or illustration, unless we dignify as such the figures at the foot of page 71—said to be from a "responsible printer's estimates," but which do not even satisfy the demands of correct addition—and the rough woodcut on page 76, which, we presume, is offered as a facsimile of the proposed authors' stamps. The figures referred to are intended to demonstrate that when the selling price of a book is increased beyond 20 cents, a disproportionate per cent. of the profit goes to the publisher. But, in the first place, it is a mere assumption that the 20-cent issue will number 20,000 copies; and if the edition is less than this, the cost of production per copy is at once increased. Doubtless a considerable number of reprints of popular novels may reach a sale of this or even a greater number of copies, but it is unsafe to assume that a book will sell in such large numbers because its price is put at 20 cents. Mr. Smith is himself authority for the statement that the publishers of the "Franklin Square Library" have not found that publication profitable, which would go to prove that the sale of a large proportion of the books in that popular series has been less than 20,000 copies.

In the second place, Mr. Smith's readers should have been told that for the 20-cent book 2 cents remains to be added by the purchaser to secure to the author his royalty, while in the case of the $1 and $1.50 books, these being the present usual prices (copyright money included) for popular copyrighted works, 15 per cent., in the case of popular authors, or 15 cents and 22½ cents, respectively, are to be deducted from the profits set out in the table as going to the publisher, these sums being paid out of said profits to the author. Furthermore, one important item in the publisher's account has been overlooked entirely, viz., the cost of carrying on the business of selling the author's productions. This represents, upon good authority, not less than 15 per cent. upon the retail price of each book ventured upon, or 22½ cents in the case which Mr. Smith instances as showing the most disproportionate profit to the publisher. Subtracting these two fixed expenditures from the 58 cents profit estimated in his tables, the publisher's net profit is reduced to 13 cents, or 9½ cents *less* upon each copy than is paid to the author.

We have taken Mr. Smith's figures as they

stand, but before any inferences can safely be drawn from the prices given by the "responsible printer" as to the cost of producing the various parts of a book, one would need to know the kind and quality of book-work he is accustomed to do, for there is often a striking difference in the material and make-up of different books, a difference which frequently means a considerable expenditure both of thought and money. As to the retailer's profit of 60 cents, every book-buyer knows that the book whose nominal price is $1.50 is really sold for $1.25 or $1.20, so that while each author secures at least 15 cents, and the popular author 22½ cents, profit on every copy sold, the combined profit of publisher and retailer is but from 43 to 55½ cents. Mr. Smith ought, therefore, in fairness to refrain from the reiteration of his favorite but unjust statement that seven-eighths of the profits on a book goes to the venders and only one-eighth to the author.

In the introductory note by Mr. Rice a telegram from Mr. Gladstone is printed, in which he repeats the hope expressed by him in the *Nineteenth Century* magazine for an international copyright between England and the United States. He thinks that it should be copyright by royalty, and expresses the belief that the method of it cannot be too difficult for practical men to adjust. Aside from Mr. Gladstone's assent, of the fourteen letters appended to Mr. Smith's article, only two—by Mr. Moncure D. Conway and Mr. Robert Ellis Thompson—are for, while eight are decidedly against the proposal. The remaining four are non-committal. Of these the first is by Dr. Oliver Wendell Holmes, who looks upon the proposal as a special issue over which the general question of international copyright may be fought as well as on any other ground. "A wrong remains to be righted, and any step tending towards that result is better than leaving it undisturbed." Mr. Whittier does not think it a complete solution of a difficult question "involving moral as well as financial considerations," but he believes it worthy of attention. No plan is too radical for Mr. W. D. Howells, who is in favor of "any and every scheme to do justice to foreign authors." He admits his inability to judge the practical workings of the stamp notion, but nothing seems to him so unpractical in the long run as the "present system of pillage." Mr. Julian Hawthorne says that he can advocate the royalty proposal only when it results in raising the price of reprints to equal the cost of native American works; but as it is avowedly urged in order to secure the direct opposite, namely, the lowest possible price for the foreign work, Mr. Hawthorne's letter must be ruled out as irrelevant.

The two advocates of the system offer very little in the way of argument. Mr. Conway is satisfied with rather inconsequent fault-finding, and the efforts of the Authors' Copyright League to secure an equitable law are characterized as a "platonic dispute about the ideal copyright," which is obstructing the saving of "millions" to literary men by means of "an emergency measure which, besides its practical advantages, establishes the principle of property in brain-product as a foundation for future enactments." And Mr. Thompson, although expressing himself as "keenly alive to the injustice done to foreign, and still more, to American authors by the absence of any law to prevent the pirating of English books," curiously enough finds in a plan which legalizes this very "pirating," a solution of the copyright problem "which secures all interests at once." In what respect he supposes the status of native authors will be improved it is difficult to imagine; but he apparently does not really mean *all* interests, for he seems to realize that "manufacturers of books" will not consider theirs secured by the scheme, and announces that they will oppose it "on both sides of the ocean."

The reasons urged by the American opponents of Mr. Smith's plan may be briefly digested. The Hon. John Bigelow not only thinks it unsound in principle and mischievous, if not disastrous, in practical operation, but, further, unconstitutional, in that it contemplates the practical confiscation of a portion, at least, of every author's property in his books to private use without compensation. As American publishers have pronounced the scheme impracticable, according to Dr. Edward Eggleston, and as it is held in detestation by authors, it cannot be adopted; and he contends that, *if* adopted, it certainly would lead to efforts being made to abolish domestic copyright for the purpose of cheapening books, thus imperilling the very existence of American literature. Mr. Lloyd S. Brice is also strongly impressed with the danger threatening our native literature, and is therefore prepared heartily to endorse any plan which would foster it by offering protection to American authors. President Gilman considers that there is the same objection to the measure that there is to every form of compromise, and concludes that the only lasting remedy is a "thorough protection of an author's property by a just plan of international copyright." Mr. G. P. Lathrop criticises various details of the plan, pointing out the practical difficulty and expense the English author would be put to in attempting to keep a supply of stamps suitable for use for the various editions arbitrarily priced by each new reprinter, and the utter impossibility of any one in England keeping track of the multifarious reprinters in this country; and he considers Mr. Smith's statement that "the more publishers compete, the better it is for the authors," to be delusive.

Mr. C. D. Warner's reply is exceedingly sharp. He considers that Mr. Smith's argument against international copyright is an argument against all copyright, and pronounces his plan impracticable and not worth discussion. He claims for the author his right to control his literary property, subject to local laws and regulations, exactly as he now controls any other kind of property he may possess. Mr. Warner does Mr. Smith injustice, however, in supposing that the latter has any connection with the protectionist opponents of copyright. Mr. Smith's plan is, so far as any one in the United States is concerned, original with himself. Mr. R. W. Gilder speaks as well for the Copyright League as for himself, in opposition to a plan which he considers objectionable on account of its impracticability, and also on account of its being false and dangerous in principle; and he deprecates the *quasi* support of it by English authors as likely to hinder the realization of the present fair prospects for equitable international copyright legislation. The reply of Mr. C. E. Norton is good enough and short enough to be quoted entire: "Neither the plan nor the mode in which it is presented meets my approval. I am unable to understand how any honest man can approve a plan which, by its inventor's own admission, is not based upon the rights of the question."

The unexpected opposition exhibited towards his scheme in America has induced Mr. Smith to announce publicly that he will not press it upon the notice of Congress, but leave the field free for the combined efforts of the Authors' and Publishers' Copyright Leagues and the friends of unrestricted copyright legislation. This last is something very different from his proposed law entitling the alien owner of literary property to a totally different kind of legal protection from that already accorded to the native author—a state of things which could result only in great confusion and ultimate injustice and wrong. Mr. Smith admits that his method can only apply to the comparatively few most popular works, and if he will carefully scrutinize the list of these, he may perhaps convince himself that they are not the very best books to cheapen in price for the sake of securing their greatest possible distribution among the masses. It is a laudable desire to wish to educate the poorest of our people by bringing *good* books within their reach at the cheapest possible *honest* price, but a little reflection should convince Mr. Smith that that is something entirely aside from the subject of copyright, international or domestic. He has himself instanced France as a country where new books are issued in cheap form (and we may add in good form), and sell in such large numbers as to pay both authors and publishers a handsome return; and yet this is done under what Mr. Smith would call a "monopoly" copyright law. There is a field for his intelligent activity in trying to bring about a similar state of things in this country, and in the meantime he should find consolation in the fact that he has the whole volume of English literature from Chaucer to Tennyson to draw upon for his cheap reprints for educational purposes, and that he can use this vast material with the least possible injustice to any one.

"*BOOKS THAT HAVE HELPED ME.*"

During the past year or two an enormous amount of attention has been given both here and in England to the business of advising people what to read. It began in England with a piece of newspaper enterprise, which consisted in getting men of distinction in politics or literature to make out lists of "one hundred books" which should form the library of a man who, for any reason, was obliged to confine himself to this number. It then took the form of ac-

counts from various people, some distinguished and some not, of "books that have helped me," and in this form it bids fair to last indefinitely. Nearly everybody who can read can make out a short catalogue, if not exactly of books that have helped him, of books which he thinks, or would like other people to think, have helped him.

The number of those who wish to tell the world about these helping books, too, seems to be practically unlimited, so strong and widely diffused is the desire to let other people into one's personal experience on almost any subject. It has been said that every man, and for that matter every woman, can furnish the plot of one novel constructed out of the principal events of his own life; and there is one story which even the most uneducated body who can talk freely, loves to tell, namely, the story of his own doings, what he has seen, or suffered, or accomplished, and especially the victories he has achieved in argument. There is, in fact, nothing more enjoyable in the narratives of unlettered people than their accounts of contentions they have had, in which the adversary was reduced to hopeless absurdity and shut up by a few pregnant remarks.

When one gets up among the literates, one finds a corresponding readiness to let the public into the secret of their intellectual growth. Hardly any one who has risen in the smallest degree into public notice is above the harmless vanity of telling the utterly obscure man how fame is achieved, or the foundation stones of even moderate greatness laid. The millionaire recalls his diligence as a boy in sweeping out the store on cold winter mornings, the lawyer his wonderful assiduity in copying papers and reading very early editions of law-books by the firelight, and the literary man the toil expended on his first verses, and his secret joy at seeing them in the "poet's corner" of the country newspaper. There is nothing sweeter than the reflection that one's own career is a standing encouragement to the young and friendless to be up and doing, with a heart for every fate.

There is probably, however, no more melancholy fact in human affairs than the infrequency with which any individual man's experience is of use to anybody else. If we profit by experience at all, it seems to be mainly by the experience of the human race, or of our particular nation, rather than by that of any individual friend, or relative, or preceptor. No matter how much we may respect or admire Brown or Jones, or even father or uncle, we generally take care not to follow his advice in the management of our own lives. Everybody who has had much experience as a counsellor knows well that people usually seek advice in order to get encouragement in pursuing a course on which they have already determined. In truth, it may be said that most of us are constitutionally incapable of doing well what other people think best, unless we also ourselves think it best. To follow successfully a plan traced for us by somebody else, it has generally to be a plan which does not concern us except as another man's agent or servant, and has his satisfaction for its supreme object.

Much the same thing may be said about "the books that have helped me." All the articles which have been written about them tacitly assume that what helps me will help you, or that Brown, on learning where Jones got his mental provender, will order home a supply of the same, and live on it. Nothing can well be further from the truth. Wherever these articles do not gratify a harmless vanity, they are interesting simply as the literary experience of one more or less respectable human being, and nothing more. Every man who loves books and reads them, and makes any good use of them, reads in the line of his own tastes and temperament and pursuits. He is not, and for the most part cannot be, helped by another man's books, supposing books to be anything more than repertories of facts. All must, of course, go to the same sources of information, or, in other words, must consult the same books of reference, but every man who reads for culture, or for encouragement, or inspiration, or power, must choose his own books. Books that have helped Brown may be interesting to Jones because he loves Brown and likes to watch the working of his mind; but they will not necessarily help Jones. In fact, the time he spent on them might be time utterly wasted, unless there existed the closest similarity in pursuits and in character between the readers.

We wish most sincerely that the subject were of more importance than it is, because we fear that although the reading of books grows, the search for books that will help one does not greatly increase. By far the larger portion of the increased sale of books is due to the demand for books that will amuse or kill time. By far the greater portion of whatever love of reading exists in the world, is gratified by newspapers and periodicals. It was when books were scarce and little known that readers hesitated and sought counsel in choosing them. The general testimony of publishers is that the books which really help people are not sought after by any means in proportion to the growth of population and the spread of the reading art.

THE TRANSCASPIAN RAILROAD.

SEVEN years ago Mr. O'Donovan made his celebrated journey to the Merv Oasis—a district up to that time practically untrodden by civilized men, and separated from the Caspian Sea by stretches of half-desert country inhabited only by robber tribes. To-day the region from the Caspian to Merv, and beyond it as far as the Oxus, is traversed by a well-built railroad, with over 600 miles of line already open for traffic, and 1,500 cars in actual use; with a large station in each oasis, and with smaller ones scattered along the route. A journey which seven years ago could not have been made by any traveller under any conditions is now regularly accomplished in twenty-eight hours. The Oxus—but yesterday a practically unknown river—is now crossed by a twelve-span railroad bridge which is fast approaching completion. The year 1888 will see the ancient Tartar cities of Bokhara and Samarcand brought within three days' journey from the Black Sea, or within a week from St.-Petersburg. American enterprise has done wonders in the way of building railroads in advance of civilization, but it has done nothing like this.

The district east of the Caspian Sea—bounded by Siberia on the north, by Persia and Afghanistan on the south, and reaching eastward as far as the somewhat vaguely defined line of the Chinese Empire—is still marked on most of our maps by the general name of Independent Tartary, though the greater part of it now belongs to Russia. It is, roughly speaking, 600 miles from north to south, and 1,200 from east to west; its area is therefore about one-quarter that of the United States. It has formed a most important neutral ground between the British and Russian possessions in Asia; for though it barely touches the northern extremity of India itself, and that at a point secure from attack, it has been the chief protection of Afghanistan from Russian invasion.

In the northwestern part of this district lies the land-locked Sea of Aral, into which the Amu or Oxus—the two names are used indiscriminately—flows from the southeast. The region to the north and east of the Oxus is comparatively fertile and not altogether uncivilized. It contains at least two cities of some importance — Bokhara and Samarcand. But western and southern Tartary is a desert — not even a region of steppes, like other parts of central and northern Asia, but a sand desert without vegetation, except in a few oases like those of Gök-Tepe and Merv in the south.

It is the custom of English writers to represent Russia's vigorous policy in this region as being due to a desire to attack India. What may be the motives which actuate Russian diplomacy at present, it is impossible to say; but there is no trace of any such premeditated plan in the early steps by which Russia was led into her present position. Making all due allowance for the partisanship of Russian reports, there is every reason to believe that she was forced to advance in this direction by the impossibility of maintaining either a peaceful or a purely defensive attitude towards the Turkomans of this region. The Turkomans would come out and plunder the Russian settlements at the north of the Caspian Sea. On the approach of regular troops they would run away. There was no way to chastise them except to follow them into their homes, where they would be forced to fight. This was what led Russia into this region. The first expeditions of this kind were in 1871 and 1872; they were apparently not ill-managed, but the forces were too small to accomplish the object in view. A larger expedition, in 1877, was discreditably beaten. The Russian Government was now aroused to the fact that it had an enemy of some power to contend with, and, as soon as the Turkish war was over, Gen. Skobeleff was sent to bring the matter to a conclusion. Against such an officer the Turkomans had no chance. He forced his way to the strong-

hold of Gök-Tepe, and destroyed the fighting power of the tribes of southwestern Tartary by what was little short of a wholesale massacre.

It was in this campaign of 1879, and at Skobeleff's demand, that the Transcaspian Railroad was first begun. He felt that he needed it in a campaign in the desert as a means of transporting supplies. But there seems to be no evidence that he regarded it as other than temporary in its purpose, or that he expected it to be continued further than the very short distance which had been necessary for the immediate objects of the campaign. At any rate nothing was done for five years, and the Russians seemed to have abandoned any idea which they might have had of a systematic eastward movement at this point. They were actually disbanding some of their auxiliary forces in this region, when the action of the Merv Turkomans, in putting themselves under the protection of Russia, roused them to new activity in this direction.

The extension of Russian authority over Merv gave rise to much controversy and some warlike talk. But, while both parties were talking, Russia was acting, and was acting in the most efficient way by extending her railroad to Merv and beyond it. Work was begun in May, 1885, under the direction of Gen. Annenkoff, one of the ablest Russian engineer officers, who was already familiar with the country, having been with Skobeleff in the campaign of 1879. Operations were pushed with the utmost rapidity. The Russians are said to have pressed no less than 30,000 Turkomans into the work of railroad building; and, what is still more remarkable, these Turkomans seem to have worked efficiently. The location was easy; the only difficulty in construction was due to the looseness of the sand, and this they succeeded in consolidating by a plaster made of loam and Caspian Sea water. The tracklayers were accommodated in movable cars, which furnished both kitchen and barracks, and which were pushed out into the desert as fast as the line was completed. The petroleum wells of Baku, on the Caspian, furnished a cheap and effective fuel. The road is already open for traffic for two-thirds of the distance to Samarcand. Next summer will probably witness its completion.

The line starts from the harbor of Uzun Ada, on the east shore of the Caspian, in latitude 39° 35′ (the name is not marked on any of the ordinary maps). It at first runs E. S. E. for over 300 miles, passing through Gök-Tepe and Askabad, and finally reaching Dushakh, situated in long. 60°, lat. 37° 20′. Here it comes so near the Afghan frontier that it can no longer continue its southward progress, and turns a trifle north of east, to Merv, a hundred miles further. Thence it runs northeast more than 200 miles to Bokhara, crossing the Oxus at Tcharjui. Its further course to Samarcand is almost due east. For military purposes the location could hardly be improved. It is not aggressively hostile to any one; it runs parallel to the Afghan frontier; but this parallelism is really precisely what is wanted, for it will enable Russia to choose her point of attack. A branch from Dushakh towards Herat—the two places are little more than 200 miles apart—and another up the Oxus, from Tcharjui to Tashkurghan, would each give Russia a line of attack. More than this, if the two existed side by side, she would be able so to mask her movements as to leave an enemy in doubt as to the position of her main force until the blows were actually struck.

What will be the effect of all this upon the relations of England and Russia in Asia, it is hard to say. For the moment it gives Russia a dominant influence on the Afghan frontier. But if it causes the English authorities to discard once for all the idea of checking Russia on the northern frontier of Afghanistan, it will be a gain to England in the end. In the first place, England will see that the only defence on which she can really rely, is her own defence of her own frontier in India. And, further than this, should it really come to a war between the two Powers, the one that fights with Afghanistan at its back will be weaker instead of stronger on that account. More will be lost by distance from home than would be gained by any support which the Afghans can give. If England will look these facts squarely in the face, and make up her mind to protect herself against Afghanistan, rather than Afghanistan against Russia, it will be best for all parties concerned.

THE ITALIANS AT MASSOWAH.

The Italians were induced in 1885, probably under the influence of the tradition left by the interference of the Piedmontese in the Crimean war, to take a hand in the struggle of the British with the Sudanese, by sending 800 men to occupy Assab, on the Red Sea. For one reason or another the expedition stopped at Massowah, which may be called the port of Abyssinia, at which many of the great routes from the interior concentrate. By the time it had got fairly settled, however, the British had retreated from the Sudan, and the Italians were left to work out their own salvation in their own way. So they determined to form a colony, which should do something to counterbalance the seizure of Tunis by the French, and form a centre of Italian influence in eastern Africa. Their arrival was viewed with some suspicion by the Abyssinians, but they made, by sending presents and negotiators, strong efforts to establish good relations with the King, or Negus, as he is called, but without much success. So they went on during the year 1886 improving and fortifying Massowah, and establishing posts in the interior on the great roads, forty or fifty miles out, without any other disturbance than raids from small bands of marauders.

But early in 1887 the Negus got out of patience, and called on the Italian general in command, Gen. Gene, to evacuate these posts, and, on meeting with a refusal, despatched his head man, Ras Alula, with 6,000 men, to clear the Italians out of one of them called Saati. Ras Alula was, however, driven off after a three hours' fight, in which he lost heavily and the Italians had only four killed. He took his revenge the following day by falling with 20,000 men on a detachment of 500 Italians which was marching to reinforce Saati. The Italian square was broken by the Abyssinian charge, very much as the British were by the Zulu charge at Isandhlana, and came near being once or twice in the Sudan, and the force was massacred to a man, after eight hours' fighting. This misfortune led to the withdrawal of most of the advanced posts, which, however, got back safely to Monkulla, a fortified suburb of Massowah.

With this warning as to the serious character of the undertaking, the Italian Government continued through the remainder of the year 1887 to send out reinforcements, until it had accumulated at Massowah and the environs a force of 25,000 men, with fifty guns, commanded by Gen. di San Marzano. An attempt of the British to mediate, through a consul who visited the Negus for the purpose, has ignominiously failed, the mediators barely escaping with their lives, and both sides are now preparing for the conflict which seems inevitable. The Italians are in hopes that Ras Alula will gather up the Abyssinian army and come down to the coast to attack them. If he does this, they expect to be able with their advantages of armament and discipline to make short work of him. But if he refuses, and hangs back, and confines himself to cutting off intercourse with the interior, and attacking outposts and convoys, and shutting up the Italians in Massowah, which an Arab proverb compares to "hell" for heat and unhealthiness, then indeed the situation will for Italy become very grave.

As yet Ras Alula has shown no disposition to accommodate the Italians by fighting on the coast. If this state of things should be prolonged, they would have to organize an expedition to reach the high plateau on which the kingdom of Abyssinia lies, through the mountain gorges by which it is on all sides surrounded. What the Abyssinian forces amount to can of course only be guessed at in a vague way. They are supposed to have about 15,000 Remington rifles which Ras Alula has taken from the Egyptians in various encounters, and to have bought as many more. Then they took 500 of the new Weteli rifles from the Italians whom they massacred at Dogali; so that if they can get ammunition, it may be said that they will have about 25,000 well-armed troops. A writer in the London *Daily News*, who accompanied the British expedition under Lord Napier to Magdala in 1868, says that if the Negus could turn out all his fighting men, he would probably muster 100,000 men. But he is not likely to do anything near this. Theodore never was able to get together more than 8,000 to oppose Lord Napier, but it is true that a great many of the local chiefs were hostile to him, and aided the invader with provisions and transport. The best calculations that can be made do not put the force which would oppose the Italian advance, day in and day out, at over 20,000 men. Any reinforcements it might receive would be peasantry armed with spear and shield only. To get to the Abyssinian plateau, which is cool, exceedingly healthy, and well watered, the Italians

would have a march of about one hundred miles, mostly through mountain passes, in which they could be annoyed a good deal, but not seriously impeded. Once on the plateau, they would have only the difficulty of supplies to contend with, but this, it is supposed, would be very serious if the natives were unfriendly. Lord Napier had the good will of the tribes, who were mostly in revolt against Theodore, and were assured that the British would withdraw as soon as the King had been chastised, and he thus had a market in his camp every evening.

The Italians, on the contrary, are believed to have come to stay, and how this would affect their fortunes remains to be seen. They have all the latest "wrinkles" in logistics, their engineers have always been famous, and the troops are excellent. But these Abyssinian tribes have an objection to being conquered or annexed which no invader has ever yet been able to overcome, and it is universally recognized that an attempt to subjugate them and colonize their territory will be a military operation of extraordinary difficulty. The interest in the attempt is, of course, greatly heightened by the position which Italy occupies in the Triple Alliance. If it plainly appeared that the expedition to Abyssinia tied her hands in Europe at a great crisis, the popular demand for its abandonment could hardly be resisted.

ASA GRAY.

THE great botanist whose death took place in Cambridge on Monday last, was born in Paris, Oneida County, N. Y., on November 18, 1810. He received the degree of M.D. at the College of Physicians and Surgeons for the Western District, at Fairfield, in 1831, but he never practised medicine. During, and for a short time after, his medical course, he gave instruction in chemistry and certain branches of natural history in a private school at Utica, most of his attention being devoted to botany and mineralogy.

Correspondence with Dr. John Torrey, then professor of chemistry in New York city, but more widely known as a learned botanist, led him to accept, in 1833, the position of assistant in his chemical laboratory, and, a little later, that of curator in the Lyceum of Natural History. By Dr. Torrey's side, he began a career of ceaseless botanical activity, and while he ever kept up a general interest in the advancement made in the sciences which, before that time, he had been obliged to teach, he was never for a moment diverted from his main purpose by their attractions. His first botanical writings appear to have been (1) a description of certain sedges, and (2) an account of new and interesting plants from the northern and western portions of the State of New York. This was followed in 1835 by the distribution of sets of 'North American Grasses and Sedges,' each set containing one hundred species. Of this work only two volumes were issued. In the following year he published for the use of students 'Elements of Botany,' a work which indicated clearly the range of his acquirements, his maturity of thought, and the peculiar literary excellences of his style. It gave a succinct account of all that was well established at that time in regard to the principles of morphology, histology, and vegetable physiology, as well as of the department in which he always took the greatest interest, botanical classification. But it was far more than a mere digest, such as any good scholar might prepare from the materials accessible in 1835-6. In many instances the young author had ventured to differ from accepted authorities, and he stated his dissenting views with decision and perspicuity. In after years he found that his expressions, uttered when a mere youth, needed comparatively little change, and he was fond of pointing out some of the advanced positions in botany which he had dared to take at that period. The method of the 'Elements' is essentially the same as that adopted in the well-known 'Botanical Text-Book,' published in 1842, and on the same lines have been laid down the larger volumes which form subsequent editions of that work.

About 1836 Dr. Gray began to contribute with regularity to the *American Journal of Science and Arts*, and continued his communications down to the present year. Of this periodical he became assistant editor in 1853, and associate editor in 1871. For half a century he reviewed in the *Journal* every important botanical publication which came into his hands, and put its readers in possession of nearly all the permanent additions made to botany during that time. His critical notices, always discriminating, were of a judicial character, and were felt to be so by those on trial; hence, in case of adverse judgment, those criticised did not cherish resentment. In the pages of the *Journal* appeared annually biographical notices of the botanists who had passed away within the previous year. All these sketches are filled with evidences of the kindest heart. Of these brief biographies of his contemporaries can be said what Darwin said of Asa Gray's letters: "There is always something in them that shows that he is a very lovable man."

In 1835 or 1836, Dr. Gray received the appointment of botanist to the Wilkes exploring expedition, which was supposed to be nearly ready for the South seas. Delay after delay, joined to certain unfortunate changes in the plan of the expedition, rendered the appointment undesirable, and he resigned before the expedition sailed. It would be interesting to speculate as to the result which would have followed the carrying out of his original intention. He would then, as a young man, have been brought face to face with problems which he afterwards did so much to solve when the materials were brought to him by others. While he was waiting for the expedition to sail, he gave all his time to the preparation of a part of the first volume of Torrey and Gray's 'Flora of North America.' About this date he was invited to accept the chair of botany in the University of Michigan. He accepted the appointment as one of its very earliest professors, with the proviso that he might be given a year in Europe for botanical study. This was granted him, and he carried to England a commission from the University to select the nucleus of its library—a duty which was so well discharged that the institution now looks with great pride upon the collection thus made by him. Although he never entered on the office of instruction in the University of Michigan, he always expressed the warmest interest in its welfare. Last summer, at its semi-centennial celebration, the University honored itself by conferring on him its doctorate of laws.

The year in Europe was filled to the full with scientific work in all the larger herbaria. He made at this time the personal acquaintance of the leading botanists of England and the Continent. In any extended notice of Gray's life, the remarkable results of this visit to European herbaria and botanists would necessarily be examined in detail, but it must suffice at this time to say that he returned thoroughly equipped for the task to which he had devoted his life, namely, the examination of the North American flora. He had made himself as familiar as it was possible to do with the type specimens in the older herbaria, brought from the earlier expeditions to America. Work upon the 'Flora' was resumed upon his return. The first volume was completed in 1840, the second in February, 1843.

In 1842 he accepted the newly established Fisher Professorship of Natural History in Harvard University. The late George B. Emerson, during his frequent visits to the Botanic Garden, near the close of his life, was fond of recalling his share in securing the appointment for Dr. Gray. He had himself been offered the chair, but he told the Corporation that "if they wanted the right man, they must look to a young botanist of extraordinary activity in New York; and I have always been prouder of this my choice than of anything else in my life." The position was not particularly attractive. Its occupant would be obliged to take in hand a good amount of teaching, while the appliances for this purpose were very slender. The Botanic Garden was insufficiently supplied with funds, and was a hindrance rather than a help in such work as that with which Dr. Gray was then occupied in New York. Moreover, there was absolutely no herbarium. But Dr. Gray entered on all the duties with zeal, directed the affairs of the Garden, conducted the stated instruction in the most lucid and winning manner, freely offered the hospitality of his study to such students as were anxious to learn more about botany than they could acquire in the formal course of lectures, gathered a vast herbarium, carried on an enormous correspondence with promptness, answered all social demands with unfailing courtesy, and, with all this, found time for three different classes of work. These are: (1) the elaboration of the North American flora, (2) the preparation of a series of educational treatises, (3) popular exposition of scientific questions. To these diverse occupations ought to be added one in which he found a sort of relaxation, but which must have made a serious draft upon his time: first as Secretary and afterwards as President of the American Academy, an institution in which he maintained the sincerest interest to the very last of his life. All these diverse occupations were carried on in the midst of administrative and tutorial cares until 1872, when he was relieved from the duty of teaching and the charge of the Garden. A few years before this he had been so fortunate as to attract to the Herbarium its present Curator, Dr. Sereno Watson, to whose hands can be intrusted safely the completion of the unfinished 'Flora.'

A mere enumeration of the memoirs and other contributions, most of which have been made, of course, tributary to the 'Flora,' need not now be given. The more extensive of these are accounts of the collections of plants made by Fendler, Wright, Thurber, and Lindheimer, part of the botany of various Government surveys, and a portion of the 'Botany of California.' The 'Botany of the Wilkes Expedition' was published in 1854. Five years later Dr. Gray published what he regarded as his most important minor work, 'Relations of the Japanese Flora to those of North America.' In this contribution, based upon studies of plants collected by Wright, he explains the similarity of the floras of eastern North America and Japan, by indicating that they had a common origin at the far north in tertiary times. He was accustomed to say that he believed that that paper had made him better known in the Old World than any other single piece of work. The views expressed in that communication

were then novel; they are now accepted by all naturalists.

The great 'Synoptical Flora,' the work of his life, is more than a revised edition of the Torrey and Gray 'Flora' of forty years ago. As far as published in its proper form, it consists of the Gamopetalous Orders, making a volume of 974 pages. Parts of the rest have already been given to the press in other forms, chiefly in contributions to the Proceedings of the American Academy.

The educational series comprises a long list, which may be roughly classified as follows: First, works for teaching the principles of botany in schools and colleges, such as 'How Plants Grow' (1858), 'How Plants Behave' (1875), 'The Botanical Text-book,' always a favorite work in England; the 'Lessons' (1857), and the new 'Elements' (1887). The first 'Elements,' published in 1836, was the forerunner of the 'Text-Book'; the last, issued during the past year, is a much revised edition of the 'Lessons,' and was designed to accompany local floras. The second class of educational works contains the 'Manual of the Botany of the Northern United States' (1848), of which there have been five editions, and of the latter edition many revised issues; also the 'Field, Forest, and Garden Botany' (1868), a useful flora for schools. Of the influence of the 'Manual' it is unnecessary to speak; it has been the *vade mecum* of all American botanists since its publication. To the third class may be referred an unfinished work, entitled 'The Genera of North America' (1848), in two volumes, illustrated from drawings by Isaac Sprague, whose sketches are found throughout Dr. Gray's works. These volumes, even in their unfinished condition, have been of great use to botanical teachers.

Dr. Gray's expositions of Darwinism and allied philosophical questions are characterized by lucidity and a singular felicity in the choice of words. If his sentences are carefully examined, it will be generally found that it is difficult to replace any important single word by a better one. Many of these papers have been published in the *Nation*, a few in the *Atlantic Monthly*, others in the *American Journal of Science and Arts*, already noticed. Some of these contributions have been republished in a collected form, under the title 'Darwiniana' (1876). For an account of Dr. Gray's relations to Darwin, beginning in 1855, we must turn to the recently published 'Life and Letters of Charles Darwin.' In those pages is portrayed the deep and tender friendship between two of the greatest naturalists of any age. The appreciation felt by Darwin for Asa Gray's criticism is expressed in many of the letters addressed to Sir Joseph Hooker and to Sir Charles Lyell. Only one citation need now be given: "No one, I think, understands the whole case better than Asa Gray" (letter to Lyell in 1860). The important part played by a letter of inquiry addressed by Darwin to Asa Gray in 1857 is familiar to all readers of Darwin's 'Life,' a long and admirable review of which work was Dr. Gray's last contribution to the *Nation*, as a review of the 'Variation of Animals and Plants under Domestication' was his first. Dr. Gray's relations to Darwinism itself are best given in his own words: "I am scientifically, and in my own fashion, a Darwinian, philosophically a convinced theist, and religiously an accepter of the 'creed commonly known as the Nicene,' as the exponent of the Christian faith." His reasons for this position were fully given in a short course of lectures before the Theological School of Yale (1880).

Two years ago, a surprise was planned for Dr. Gray's seventy-fifth birthday. It had been agreed that on that morning he should receive notes of congratulation from every American botanist, old and young. The notes were accompanied by a vase of silver, on which were embossed figures of the plants more particularly identified with his name or studies. It was delightful to witness his childlike pleasure as he received the gift. Among the letters were some from others than botanists. The following lines came from Mr. Lowell:

> "Just fate, prolong his life, well spent,
> Whose indefatigable hours
> Have been as gayly innocent
> And fragrant as his flowers."

Dr. Gray's last year had been one of peculiar happiness. Early in the spring he made a voyage to Europe, and, in company with Mrs. Gray, made a round of visits upon old and new friends. His activity is described as marvellous. On his return in October there were no marked indications that his useful and beautiful life was drawing to its close. He maintained his interest in recent questions, and engaged at once in the work of the 'Flora.' Even to the last month he carried with him the cheery manner and the winning smile which made him a welcome guest everywhere, and at all times. He continued to answer every demand upon his energies. His answers to the younger botanists were as patient as ever, and all looked for a few years more of his wise counsel. It was hoped that his journey, which had been crowned by the highest scientific honors and gladdened by the renewal of old friendships, might have strengthened him for a few years more of work. On his desk there remains the nearly completed revision of the 'Vitaceæ, or Grapevines, of North America.' On his writing-table there is left the unfinished necrology of the past year, which must now be closed by another hand; but no touch delineating character and scientific achievement can be as tender or as true as that of the master who has gone to his well-earned rest.

THE OPENING YEAR IN IRELAND.

DUBLIN, January 14, 1888.

WILFRID S. BLUNT is an English gentleman of wealth, culture, and high character, whose devoted wife, Lady Anne Blunt, is granddaughter of Lord Byron. He first came prominently before the public a few years ago as the defender of Arabi Pasha after the bombardment of Alexandria. But for his exertions, the disgrace of the Egyptian patriot's execution would now rest upon the United Kingdom. Belonging to the class least sympathetic with Ireland, that is, the aristocratic English Catholics, he was yet impelled by his strong love of freedom and justice to consider her condition. He travelled over the country, and has latterly become a warm advocate of home rule and a bitter opponent of the Government policy. He is now, as a common malefactor in prison dress, picking oakum in Galway jail. The circumstances attending his conviction are so illustrative of the methods of the Irish administration that I may be pardoned for stating them at some length.

The baronies in Clare and Galway, surrounding Loughrea, Portumna, and Woodford, and stretching west from the shores of Lough Derg, have long been the most disturbed districts in Ireland. There have occurred the worst instances of landlord exaction. It was so nine years ago, at the inception of the agitation, when, according to a classic Land League ditty, known all the world over in Irish circles, Murty Hynes "lived in ould Loughrea." It is so to-day, when, according to Mr. Shaw Lefevre, nearly every peasant met in the district had been in prison, was going to prison, or had relations in prison. The worst rack-renter has been the Marquis of Clanricarde, a heartless usurer, who has not visited his estates for some twenty years (not even coming over to the funeral of his own mother), who has refused all concessions, and who upon a late occasion dismissed an agent primarily for forwarding to him a respectful memorial from his tenants. His conduct even an Irish judge of one of the superior courts the other day declared had "aroused the indignation of the empire." Upon the side of this man all the authority of the Crown is at present ranged; against him all the spirit of the country. To silence those who went down to stand by the people, the League and its meetings have been suppressed in the district. Upon the 16th of October Mr. O'Brien and others eluded the vigilance of the police, the telegraphic wires were cut, and they held by torchlight a midnight meeting at Woodford, at which the Lord Lieutenant's proclamation was burned and very strong language used. The half-dozen policemen in the town were powerless to interfere, and were preserved from any molestation by some of the chief actors. Mr. O'Brien vigorously denounced crime ("Let there be no crime and no surrender"), and the most perfect order prevailed. Mr. Blunt spoke at this meeting. Every one present laid himself open to six months' imprisonment with hard labor; but when a few weeks passed and no prosecutions ensued, it was believed that the Government saw the impracticability of imprisoning all the inhabitants of Woodford.

But if the National League was proclaimed, others felt they were free to express their opinions. The English Home-Rule Union has been in existence for some years. It advocates home rule for Ireland; and while occasionally taking upon itself to advise the Irish people, it studiously holds aloof from countenancing the plan of campaign and other methods of the Nationalists. In autumn, several members of this Union were in Ireland, and they advertised a meeting at Woodford on Sunday, October 23, at which there were to be none but English speakers. This meeting was proclaimed by the Castle, although, as Divisional Magistrate Byrne, who suppressed it, afterwards declared in evidence, "I have no reason to doubt they would have counselled the people to patience and endurance"; adding, somewhat inconsistently, "I believe that though the speeches of those English gentlemen were to counsel the people to abstain from all crime and outrage and violence, the effect of the meeting would be to induce violence." Mr. Blunt and his English friends determined to protest, and informed the police of their intention. They ascended the platform, which had been erected before it was known that the meeting would be proclaimed. The police swept them off. Mr. Blunt resisted and was arrested. At Woodford on the 27th of October, for this offence he was sentenced by the police magistrate to two months' imprisonment. He appealed to the next Quarter Sessions, and it was widely believed the appeal would be successful, that the English Home-Rule Union had as much right to meet at Woodford as in Surrey, that all liberty of speech was at an end if the Castle of its own motion, without reference to magistrates (even police magistrates), could suppress the meeting of any association in any part of the country. The Crown refused to produce the depositions of the magistrates, if any, and the Divisional Magistrate admitted: "I want to explain that I never was left discretionary powers with regard either to preventing a meeting or dispersing a meeting." Mr. Blunt was convicted sole-

ly and altogether because of his action at this meeting of October 23.

The appeal could not be heard for more than two months. Some six or seven weeks after the midnight meeting of October 16, and when it was supposed to have been passed over (retribution by the Government being usually prompt), the public was surprised at a number of persons being arrested for participation on that occasion. They appeared taken somewhat at haphazard. Among others, a Mr. John Roche, who was chiefly instrumental in preserving good order, was tried, convicted, and sent to jail for some weeks. "He behaved well, and made way for the police through the crowd," said one of the police witnesses. Mr. Blunt's appeal came on for hearing at Portumna last week, before County Court Judge Henn, who, it is said, for the past twenty years in his rounds has been the guest of Lord Clanricarde's representatives at one of his residences in the neighborhood. A strong bar was engaged on both sides, numerous English visitors (Shaw Lefevre, and others) were present, and the deepest interest was shown in the proceedings. How could the Government, in the face of British public opinion, sustain such a case? They proved themselves equal to the emergency.

> "For ways that are dark,
> And for tricks that are vain,
> The heathen Chinee is peculiar."

The moment the Crown case opened, the reasons of the unexpected prosecutions for the midnight meeting were evident. They were to be used against Mr. Blunt. The depositions at Mr. Blunt's trial were not even put forward, and, after some becoming hesitation and against the indignant protestations of his counsel, the Judge admitted as evidence in the case the proceedings at the midnight meeting of the 16th and the consequent convictions. The rest was easy for the Crown. Judge Henn confirmed the sentence. The animus shown in his judgment was so extraordinary that no wonder "murmurs of astonishment were heard through the court when the Judge had concluded," or that the *Daily News* should write:

"Immediately Mr. Henn remarked that when Mr. O'Brien said, 'Commit no crime,' he meant 'Commit crime,' that putting a match to a document from Dublin Castle was 'an act of insurrection,' and that Mr. Blunt in not protesting against Mr. O'Brien's speech was guilty of having uttered it. We need not waste words over such trash, repugnant alike to law, to equity, and to common sense. Mr. Blunt has been condemned on testimony which the members of a drumhead court-martial who respected themselves, would have repudiated with scorn. The Coercion Act gives the Lord Lieutenant no more power to interfere with public meetings not being meetings of the League in districts where the League has been suppressed, than he had before. It was as legitimate and peaceful an assembly of law-abiding citizens as has ever been held in any country."

An English member of Parliament who was present told me he was much struck by an incident illustrative of the Crown tactics which was not reported. Before Mr. Blunt's appeal came on, the Crown lawyers endeavored to introduce out of rotation several cases of resistance to eviction among Lord Clanricarde's tenantry, so as to influence the mind of the Judge regarding the condition of the district. Foiled in this, they managed before Mr. Henn considered his judgment to mention the particulars of these cases in considering the arrangement of the future business before the sessions. Mr. Blunt is in Galway jail picking oakum. A public subscription is being forwarded to carry the case by means of civil action against the police who obstructed his meeting.

This and other instances constantly occurring here show the necessity a government is under—once having entered upon despotic action—of sacrificing all liberty. Effective discrimination seems nearly impossible, as it became in the United States in the effort to restrain slavery before the war. Nor is it possible for the Government to consistently administer the law all round, which would appear to be the only true policy under such circumstances. The law is strained one way against the people, in the other in favor of (or set aside as regarding) officials. There were most disgraceful instances of this tendency during Earl Spencer's Government. There is a fatality in a coercive régime that carries with it disgrace to the purest-minded administrators.

Mr. Balfour's contention before English audiences, that the police magistrates, by whom alone cases under the Coercion Act can be tried, stand indifferent between the people and the Executive, is belied by every-day facts. These magistrates are appointed to hold office at the discretion of the Castle. They constantly come up for consultation with the head officials. If they get into any legal difficulty, they are defended by an array of Crown lawyers. Last Thursday the Court of Appeal presented the spectacle of Lord Ashbourne (as Lord Chancellor) sitting in judgment on a case arising out of the prosecution of a news-vender under the Coercion Act, he being one of the chief advisers and pillars of the present Government in Ireland. Beside him sat Mr. Justice Fitzgibbon, with whom Mr. Balfour spent his Christmas holidays.

Two recent cases strikingly illustrate all this. Informations at the suit of some little girls for criminal assault were, about ten days ago, sworn before the Mayor of Cork against a high official, an ex-military officer; but the police have as yet declined to act upon them. Again, after an execution last Tuesday the coroner's jury exercised their statutable right of demanding the presence of the executioner. He had been spirited away by the detectives, and no effort has been made to execute the Coroner's warrant for his appearance. The Coroner declined to give an order for the burial of the remains until the executioner was produced; the Crown evaded the difficulty by procuring a special permit for interment from the Lord Lieutenant. The true policy of the Government would appear to take every opportunity of conciliation within the law, but the contrary policy (one of unnecessary exasperation) seems to be deliberately adopted by Mr. Balfour. The Lord Mayor of Dublin was ordered by his judge to be imprisoned as a "first-class misdemeanant." He is at once hurried privately, one cold winter's morning, from Dublin to Tullamore, so as to be out of the reach of the visits of his family and friends. Mr. Sheehy, M.P., has been confined as a common malefactor. While yet some weeks of his sentence are unexpired, he is brought up on another charge under the Crimes Act, before another judge, who, shocked at his appearance and what he had gone through, in sentencing him to a further term, directed he should be treated as a "first-class misdemeanant," involving the right to see his friends, supply his own clothes and diet. The Government persist in considering him in the overlapping time as a malefactor, the only change hitherto in his treatment being the substitution of a chair for a three-legged stool in his cell.

Extraordinary convictions are taking place—shopkeepers for refusing to supply goods, even in cases where it was proved that the parties denied were not ordinary customers; smiths for refusing to shoe horses under similar circumstances; news-venders for selling newspapers. Mr. Corcoran, foreman printer of the Cork *Examiner*, has been sentenced to two months' imprisonment (a month each for two publications, so as to prevent the right of appeal which one conviction for two months would involve), because the Cork *Examiner* published reports of proceedings of suppressed branches of the League; and this although Mr. Crosbie, son of the editor, who is himself abroad in poor health, assumed the full onus, and declared that Mr. Corcoran was in no way responsible for the contents of the paper. Then we have the case of Mr. T. Harrington. He is Secretary of the National League and one of Mr. Balfour's most formidable opponents. He has been sentenced to six weeks' imprisonment, on the technical plea that he is registered as joint owner with his brother Edward, also an M.P., who has just undergone several weeks' imprisonment for publishing in his paper, the *Kerry Sentinel*, reports of suppressed branches of the League; and this notwithstanding proof that Mr. T. Harrington has had nothing to do with the paper for years, that his partnership in it was long ago dissolved, and that his conviction rests solely upon the mistake of a clerk in filling up the registration certificate required from newspaper proprietors by the Post-office.

With all these doings the ascendency class are more than ever gratified and satisfied. "Stick to it, stick to it, stick to it, my lad," 's the Christmas card of the Dublin *Union* newspaper to Mr. Balfour, and at several meetings of the Landlord party the warmest approval is expressed of his action. The *Reflector*, a new "Unionist" organ, commences a leader to-day with: "The Chief Secretary to the Lord Lieutenant of Ireland is probably, with one exception, the most popular English politician now living." Yet signs are not wanting that numbers of the middle and upper classes, whose interests are not directly bound up with land, are awaking to the gravity of the situation and the necessity of terminating this ruinous and demoralizing policy of brute force as against public opinion. The approaching visit of Lord Ripon and Mr. Morley will afford an opportunity for the expression of these convictions. I am myself surprised at the number of men of character and position who, hitherto holding themselves entirely aloof from politics, and consequently having hitherto been counted among "Unionists," entering their names on the "Reception Committee," as I am surprised also at the number of those who, holding the strongest views in opposition to the Administration, still feel justified, from selfish motives, in withholding all public expression of their opinions. Some of the present transition, especially among lawyers, is doubtless due to ulterior personal considerations, but it is not less striking on that account.

If anything were wanting to justify in the main the Parnell movement, it would be the long list of reductions of rents confirmed on appeal which have lately been given to the public, generally averaging about 33 per cent. Such reductions may tend to mollify the tenantry, but they are not very likely to detach them from the leaders through whose exertions and sufferings alone such substantial concessions have been obtained.

But for the length to which this letter has already run, I should like to refer in detail to the late charge of Judge Waters to the Grand Jury of Waterford, in which he comments upon the general absence of crime in the county as well before as since the passage of the Crimes Bill, the favorable comparison of Irish with English criminal statistics, and the average inclination of Irish juries upon proper evidence to agree to verdicts.

D. B.

Correspondence.

THE SALOON IN KANSAS.

To the Editor of The Nation:

Sir: In your paper of January 12 you refer to Kansas in your article on "Successful Anti-Liquor Laws" as no more successful than Iowa and Vermont "in keeping saloons closed." If by saloons you mean the usual open saloon where liquor is sold, you are mistaken as to Kansas in general. There may be on the frontier, in new and lawless neighborhoods, and in one or two of the largest places in the State—like Wichita or Leavenworth, places of 30,000 and 25,000 respectively—and possibly in Kansas City, Kansas, open saloons; but not elsewhere in the State, or my information and observation are at fault. Indeed, I think the success here in closing the saloons is wonderful, and it is owing, it seems to me, to several causes—not the least of which, probably, is the fact that there is no city of more than 30,000 population, and only three of more than 15,000. Then the foreign-born population is small, and the people are agricultural, and the mining population is small, only a few hundred in any locality.

This does not mean that liquor is not to be had by those seeking it; the fact is, that one can probably purchase it in nearly every place in the State of any size, and it is constantly shipped into the State by the dealers in Kansas City and St. Joseph, and many drug stores supply it. But the use of it has greatly fallen off, and public sentiment has grown more and more favorable to prohibition, or at least to having saloons closed.

I am not a prohibitionist in the ordinary sense, though a temperance man, and I was not in favor of the experiment in Kansas; nor would I favor the same experiment in any State upon the basis of merely a majority of the votes in favor of it. But I think the prohibitionist may properly claim the movement in Kansas as thus far a great success. This fact, as I think it is, does not militate against the soundness of your reasoning in your article referred to. With a few cities of 50,000 or more in our midst, the situation in Kansas would be, probably, very decidedly changed.

Edward Russell.

Lawrence, Kas., January 20, 1888.

THE OTHER SIDE OF HIGH LICENSE.

To the Editor of The Nation:

Sir: Your article on high license in No. 1176, by giving only one side of the matter, gives too favorable a view. There is another side of a very different sort, and it is one that gives very serious concern to many even of those who think that the general results of high license, in great cities and some States, are better than prohibition has thus far secured on the same ground. The principal sources of evil are two:

(1.) There are some villages, and even large towns and counties, in which prohibition is perfectly feasible, and has been successfully worked in the past, but in which the greed for large license fees, with the resulting reduction of taxation, has broken down the majority for exclusion and caused the licensing of a saloon or two or more. But saloons are peculiarly mischievous when first opened in a place in which the young have not grown up face to face with their evils; during the time that is necessary to educate and array public sentiment against them, they do a deadly work.

(2.) In many places the sudden discovery of the possibilities of revenue from high license has produced a craze for the reduction of taxation in this way. Hence has arisen the desire to license as many saloons as possible, that the annual question, "What is the tax rate this year?" may be answered in a gratifying manner. But there is a limit to the profits even of the liquor business, especially when the first act of the year is the payment of $500 or $1,000 into the city treasury, and the second is the payment of a heavy Government tax. There has been under high license very generally a falling off in the number of applications for license in the second and even in the third year, the old set being slow to give up. But fewer licenses means more taxation or a stopping of the public improvements that the flood of license-money permitted. Out of this state of things naturally grows a disposition to give the saloon-keeper more range, more sources and opportunities of trade, than the law allows; that is, to wink at the sale of liquor to minors and habitual drunkards, to try not to see the people sneaking in at the back door at midnight or on Sunday, to tolerate gambling in or in connection with saloons, and even to refuse point-blank to take away the licenses of those who have been convicted in the courts of violating the restrictions of the license. In some towns, and in all towns by some people, it is freely said that "the fine is punishment enough," and that "we must not be too strict with them or they will throw up their license." The goose lays a golden egg, and must under no provocation be killed.

How great the demoralization is that is thus produced, only those can realize who have tried, while participating in government, to persuade their fellow-officials to be strict. Perhaps the evil will grow less with time; that is what we are waiting to find out. Until things begin to better and have bettered very much, we cannot share very heartily the satisfaction that you feel. The thing that grows upon us is the conviction that the saloon is an intolerable pest.

H. M. Whitney.

Beloit, Wis., January 24, 1888.

THE TOBACCO TAX.

To the Editor of The Nation:

Sir: I am glad to see journals like the *Nation* advocating a repeal of the revenue taxes on tobacco. The question must now be respected by all fair-minded men, and the Congressman who shall become the champion of a measure for the repeal of these taxes will earn the lasting gratitude of the people of this country from one end to the other. The amount of money actually collected by the Government as taxes on tobacco, though objectionable, is less ruinous than the iron-clad regulations necessarily thrown around the tobacco business. The complications of the law are so mazy, the bonds required are so heavy, and the penalties for violation of the law so severe—ranging in fines of from $100 to $20,000, and always accompanied with imprisonment for from six months to five years—that both the production and manufacture have been driven into comparatively few hands. The few manufacturers, especially, who have thus been placed in the position of monopolists have almost all grown immensely rich, and will now fight to have the law retained, not for the pleasure of paying the taxes, but for the advantage of the monopoly which it guarantees them. There are thus no licensed dealers in the small towns, and the farmer must raise sufficient to make up the regulation case or hogshead, so as not to be classed as a retail dealer, and ship a long distance to the city. Here only the large producers stand any show at all, the small shipments being little better than confiscated.

Thus, as above stated, all but comparatively few producers have been driven from the field, and the area of production is greatly restricted geographically. In the meantime, consumption has not materially decreased, and the erstwhile producer is still a consumer; and not only he, but all those whom his surplus crop would naturally have supplied, must buy from the aforesaid monopolists.

The law has fallen with peculiar hardship upon a very numerous class of small farmers, who are the most helpless of any class of men in the world under such circumstances. Not only do they submit, but their voices seem never or but feebly to be heard. A farm which will not support a family by raising grain once maintained them in comfort and gave honest employment to all its members by raising tobacco. Their old barns may be seen abandoned and rotting down in some parts of the country to-day. Land which would be valuable is worthless. Homes which might be united and happy are early scattered in poverty and ignorance. Thus have I myself seen prosperity depart from a community, and I have only sacrificed details to brevity in this letter.

Perhaps tobacco is a luxury. Anything better than corn-bread and bacon would be considered as such by many of these farmers. But what a delightful luxury must be the piling up of millions of dollars through the advantages of a close monopoly, even though we know that those who have a natural right to share in those millions are shivering and hungry in another part of the country.

W. M. H.

St. Louis, January 18, 1888.

COEDUCATION.

To the Editor of The Nation:

Sir: Everybody knows that extraordinary conclusions can be deduced from statistics if one sets about it with that intent, but your correspondent on the subject of coeducation has certainly surpassed all former records in that line. Let us examine his argument. He concludes:

(1.) *That women prefer colleges open only to women.* The New England colleges open to both sexes, from which this conclusion is drawn, are Bates, Boston, Colby, and Wesleyan. They are all either very small, or very denominational, or both. That they have fewer women students than the colleges open to women only may be accounted for by the fact that women prefer the best and most richly endowed of the colleges that are accessible to them. It is impossible to find out what Eastern women think about coeducation until the great Eastern colleges are open to them on the same terms as to men.

(2.) *That the necessity does not exist of admitting female students to colleges heretofore reserved for men.* What *necessity* ever existed for admitting women to any colleges? It was not pretended that they would commit harakiri if they continued to be denied the higher education, but it was maintained that it would be wholly to the advantage both of the whole race and of their half of it if they were to be made free of the best education attainable. So long as Harvard and the Johns Hopkins University offer better facilities for getting at the heights and depths of learning than the smaller colleges do, women cannot give themselves up to the contented enjoyment of what they have

got, although they like what they have got very much better than nothing at all.

(3.) *That in the eastern section of the country collegiate coeducation will not be extended.* It is impossible to see what ground your correspondent's figures give for this conclusion. The data are not sufficient to enable one to lay down the curve of rapidity of extension, and to show that it has already reached its asymptotic form; they have, in fact, no bearing whatever upon the question.

(4.) *That colleges limited to one sex enjoy a remarkable degree of prosperity.* This conclusion is the most interesting of all, and I have therefore reserved it for the last. Its ground is, that the five large New England colleges have not yet admitted women, and that they have not on that account *been reduced to small colleges.* The aggregate number of students at Yale, Amherst, Harvard, Williams, and Dartmouth for 1874 and 1884 were 2,418 and 2,948 respectively—that is, they showed an increase of 22 per cent. At the four small colleges named above which admit women, the increase was from 343 to 621, or 81 per cent.—that is, nearly four times as much. These figures would show, if they showed anything, that to admit women is to cause a *nearly four-fold more rapid increase in the number of students of a college than would otherwise take place*—a very satisfactory result for the friends of coeducation. That the women's colleges have been prosperous does not show, as we have pointed out before, that separateness is a cause of prosperity, for there are no mixed colleges of the same rank and character with which to compare them. In spite of that fact, however, the rate of increase of women at mixed colleges has been 221 per cent., and at separate colleges only 296 per cent.

The colleges of the West, your correspondent states, are overwhelmingly coeducational, and he says that it is hard to draw conclusions from them. It is true that it would be a little harder to draw from them the *same* conclusions which he draws from the statistics of Eastern colleges, but *some* conclusions it would not be difficult to draw, and, in fact, President Angell of Michigan University draws some highly interesting ones on the very next page of the *Nation* to that on which your correspondent's letter occurs.

We proceed to show that these same tables of statistics, if skilfully handled, may be made to yield another conclusion, more interesting and quite as sound as those to which your correspondent has been led. Counting Vassar as a New England college (this is necessary, because otherwise no comparison is possible, and it is admissible on account of the large number of non-New England men who go to the great New England colleges), the rate of increase in the women's colleges per decade has been 296 per cent., and in the men's colleges, taking the five great ones as a standard, it has been 22 per cent. If this state of things continues ("And how," said a workingman to me the other day, "do you judge of the future, if not by the past?"), then in another decade the large colleges will contain more women than men, and in another twenty years there will be, roughly speaking, four times as many New England women as men who are receiving a college education. This conclusion, reckless as it is, need not appear so very startling, for there are already, in the whole country, four times as many girls as boys who finish the high-school course.

CHRISTINE LADD FRANKLIN.

TO THE EDITOR OF THE NATION:

SIR: Being "interested in the progress of coeducation"—at least in all advanced post-graduate lines of work and study—I have followed the advice given by Mr. William A. Merrill of College Hill, Ohio, in his letter to the *Nation*, in its issue of January 19, and have examined the tables referred to "from the reports of the Commissioner of Education for 1874 and 1884-'85," and also the last published report of the Education Bureau, that of 1885-'86.

Without intending to accuse Mr. Merrill of special pleading, it seems to me that some of his "conclusions," as summarized in the letter, are hardly supported by the more detailed tables from which he made up his abridged ones, or by the statistics of "secondary education," to which educational strata, by the by, many of the institutions entered under the head of "Universities and Colleges" really belong. Personally, my prejudices are opposed to coeducation except in kindergartens and universities; but the people of the United States seem inclined to steadily extend its field in spite of such prejudices.

In an article on "Secondary Instruction" (page 359, Report of Commissioner of Education, 1885-'86), the Commissioner says:

"In eighteen States and three Territories reported in 1884-'85, coeducation was a feature of three-quarters or more of the schools under consideration; in nine States and four Territories it was a feature of one-half the schools, or less than one-half; and in eleven States the coeducation schools numbered between one-half and three-quarters of the whole. It is therefore evident that there is no settled prejudice against coeducation among those classes in the United States who are able and willing to prolong the education of their children beyond the elementary stage."

In 1876, of the 356 institutions classed as "Universities and Colleges," 140 report women students; in 1885-'86, of the 346 reporting under this head, 190 admitted women. Of the 26 new institutions of this character established in the 10 years between 1876 and 1886, 19 were coeducational. In 1876, about 6,000 women were "reported" as attending coeducational "colleges and universities"; in 1886 this number had increased to nearly 8,000, and is really considerably greater, as a number of institutions which had reported their male and female students separately in 1876, in 1886 merely reported the total number.

The tables and reports are all imperfect, one college leaving this question unanswered, another that; but the general trend of their evidence leads me to somewhat different conclusions from those suggested by your correspondent.

(I.) That *all* colleges, either limited to one sex or coeducational, where well-equipped and well-officered, "show a remarkable degree of prosperity," and that this increase is not *proportionately* greater in "colleges limited to one sex," for "a consideration of the several classes under which colleges and universities of the United States may be presented will, it is hoped, suffice to show that superior instruction in this country is rapidly assuming definite character as regards both its instruments and its purposes. As the process goes on, pretentious institutions are naturally overborne and finally disappear, while those that 'have a name to endure' strike their roots deeper and deeper into the community" (see Report, 1885-'86, p. 461).

(II.) That women, like men, prefer those colleges which supply with least expense their special needs most agreeably. To thousands of women this is done acceptably by coeducational institutions. Others prefer colleges exclusively for women, and these latter seem to be patronized by two classes of students: (1.) the daughters of parents who prefer to send, during undergraduate years of study, young and inexperienced girls to colleges *under the direction of women;* (2) students who, being financially able to choose, pass by second-rate coeducational institutions for first-class women's colleges. The most thriving women's colleges are at the East, where coeducational ones equally good are rare.

In this connection, mention may be made of a recent statistical statement in a report to the Association of Collegiate Alumnæ, in regard to the occupations of women college graduates. Of the twelve colleges from which those so classified had graduated, nine were coeducational, and of these nine seven had admitted women since 1870.

(III.) That, throughout the country, the coeducational colleges under denominational control, such as Oberlin, Hillsdale, Milton, Leland University, etc., have steadily thriven, showing no change of opinion among a large body of conservative people in regard to coeducation.

(IV.) "That the necessity" *does* "exist of admitting female students to the higher institutions of learning heretofore reserved for men," because only in these universities can post-graduate, professional, or "special" female students secure the advantages they crave and are preparing for. Furthermore, that the growth of liberal opinion favors the extension of the advantages of our great universities to women, and that "in the eastern section of the country collegiate coeducation *will* be extended."

Mr. Merrill mentions Harvard Annex as though it were a protest against coeducation; it certainly cannot be so regarded—although it may be a foreshadowing of one of the forms which coeducation is to take. The Harvard Annex is not a college for women in the sense in which Wellesley and Bryn Mawr are women's colleges. "The original object was not to build up a college for women, . . . but . . . simply to repeat for women the collegiate instruction that was already provided for men by Harvard College. Its instruction is given exclusively by professors and other instructors of Harvard." (Report for 1887.) The steady increase in the number of its students (this year ninety) is the best reply to those who assert that it is "unnecessary" to offer women the advantages of our older universities. The very increase in the number of women collegiate students, and of "institutions for the higher instruction of women," is a reason for opening to women the best equipped and endowed universities, so that they may as women continue most advantageously the studies begun as girls in high schools and colleges, coeducational or otherwise, or under private tuition.

Within the past year, several cases have come to the writer's knowledge where young women of ability and professional position have been refused admission to special courses at Johns Hopkins, only because they were women. "We are very sorry, but the trustees have so voted." One of these applicants was a teacher who wished to increase her usefulness by attending Prof. Hall's lectures on Psychology, specially designed for teachers; another was a young physician, anxious to carry on her pathological studies under Prof. Welch. Such applications are only heard of accidentally, but there is a steadily increasing sympathy with them when known.

When Columbia College grudgingly offered fairly generous opportunities for study and a conservative "certificate" for women, the entering wedge was driven which assures for women finally university training. The change may come slowly, but figures (Columbia has

thirteen women students this year, and a much larger number in the School of Library Economy), reason, generosity, justice, all urge that women shall be permitted to train their minds under the same august supervision which polishes and moulds those of their fathers, husbands, brothers, and sons.

Public opinion in educational matters is shown most surely in private and individual action. Therefore it may fairly be assumed that as long as the number of students in the average coeducational high school and college steadily increases, so the pressure will increase against the doors of our highest institutions of learning, until they too are opened, under limitations if you please, to the female graduates of any school or college, coeducational or otherwise, which properly prepares them to enter the more learned precincts of Harvard, Yale, Columbia, Princeton, Johns Hopkins, etc.

C. B.

Baltimore, January 29, 1888.

CRIMINAL POSING AMONG THE GERMANS.

To the Editor of The Nation:

Sir: In your note in the last number of the *Nation* upon the career and trial of the thieving postman, Zalewski, which was related in the November number of *Nord und Süd*, you refer to the reason Mr. Gross assigns for the offence, *i. e.*, an ambition "to be the hero of what we call a 'dime novel.'" This assumption by Germans of a trite explanation of the most notorious and hideous criminal offences among their people is one singularly weak and unreasoning, it has struck me, and, moreover, reflective of an inherent, silly vanity and moral obtuseness which other nations, I feel sure, would hesitate to ascribe to them. And the desire "to be a hero," a hero in crime, seems to be the constantly recurring reason assigned by individuals of every class for most heinous offences.

A maid subserving in the household of the Prince of Lippe-Detmold threw herself into a mill-pond. I asked her friend Louisa, who waited upon me, the cause: "*Ach!* she would like to have people talk about her." A young man who regularly walked the opposite pavement, and smoked his after-breakfast pipe, disappeared. After a day or two, we heard he had made away with himself in Hanover, and willed his body to the dissectors. "He wanted people to talk him over," said the grandmother of one household; "and he had debts, too." In turning over an album I met the pictures of two fine-looking boys of about twelve and fourteen years of age. Their young lady cousin, a schoolmistress, explained that they were dead, having planned together an awful taking-off. After watching for weeks for an opportunity to accomplish their plan, they were left alone one summer night in a country-house. The older made away with the younger, and then with himself. When I asked the reason, there came the unfailing reply: "They would be heroes and have the world talk of them." A kinsman of a Westphalian went to Paris, hired a box at the opera, and in the midst of the gayest scene shot himself through the head. "But why?" I questioned. "*Ach!* he would be talked about," was the reply. In the autumn of 1882 a postman in Berlin murdered a man, and concealed his tracks with utmost cunning. "What was the cause of the act?" I asked a Berlin professor. "He wanted to be a hero," the professor answered; "he was thinking of the fellow (Kerl) down in Vienna who did the same thing last year for the same reason." I remember that certain Berlin papers assigned a like cause for the act.

Can this morbid desire of posing, ascribed by the Germans themselves in the instances above cited—this wish of being in the mouths of people—be at the root of many crimes in Germany? With the Germans, we sometimes attribute the tendency to suicide in their country to a selfish over-sentimentalism, a mania of egoism. Shall we also follow them in lightly reasoning that many other unexplained crimes against life and property in their country are to be referred to the same cause?—Respectfully, K. S.

Cambridge, Mass., January 23, 1888.

"GALEOTTO."

To the Editor of The Nation:

Sir: It is a very clear analysis and a very trenchant criticism which "B. P." gives of Echegaray's 'Galeotto.' Incontestably, whatever may be its other literary and dramatic merits, its epilogue is miserably lame and impotent—what is more, is as far from realism as idealism ever dare be. Why, then, are not common sense and artistic sense at once revolted? What is there in this passionate cry of the South to catch the cold, critical ear of the North? On what strong wings is the poet's fame uplifted in its flight "past the Pyrenean pines"?

Surely, the strength of the play must not be sought in the nerveless commonplace that it is very wicked to gossip; nor can it be found in the questionable doctrine that you can make white dark by calling it black. The one is true, but not new; the other new, but not true. But has not the poet after all "builded better than he knew"? Is not the intense human interest of the play, which alone can make it "strong" or popular with the cultured, in fact rooted in our irresistible sympathy with two lovers? Was not Galeotto, was not the "book," really right? Assuredly, in the old tales, the luckless pairs were all along the intensest lovers. Perfectly innocent, perfectly unconscious, they might have been, until the touch of a hand, the glance of an eye, closed the electric circuit, and their quivering natures leaped together in flame. The poet, strive as he may, cannot wrest man away from nature. Gossip, after all, was right. At least, the human heart supplies the defects of the poet's imagination, and rejoices all the more in the love of *Ernst* and *Julie* because the weight of nobility in their souls suppressed it into unconsciousness.

The ultimate motive of this tragedy is, then, it would seem, not different from that of the early Greek drama: it is the strife of man with destiny; or, rather, it is the battle in and around man of the powers above. Here it is the god of love quelled by the god of hospitality. Gossip is at best but an armor-bearer in the fray. William Benjamin Smith.

University of Missouri, January 22, 1888.

THE TRAINING OF THE HUMAN MIND.

To the Editor of The Nation:

Sir: Let us settle our facts first and draw our conclusions afterwards. My facts are, first, that Charles Darwin received a strict, rigid, or, if you please, narrow classical education extending through school and college; second, that his working mind evinced the keenest observation, the deepest reasoning, the most patient research, the most careful deduction. Who is the correspondent that will controvert either the one or the other of these facts? If any would, I respectfully tell him that the only effective way for him to overthrow my facts will be for him to produce a naturalist, philosopher, or scientist who, having been trained in early life by means of a scientific or optional system of education, developed in after life a better working mind than Mr. Darwin's. Who is that naturalist, philosopher, or scientist, and where was he educated?

Your correspondent "X." (*Nation*, January 26, 1888, p. 73) says, in substance, that nothing could have been worse for *his*, Mr. Darwin's, mind than this narrow classical education. I respectfully deny the asserted fact. We are now dealing with the reasoning and observing faculties of the human mind; and, in the endeavor to get at the *facts*, I call upon "X." to produce instances where the observing faculty of Darwin brought him false information, or where his reasoning power dwindled away in shallow inferences. In the law it is necessary to establish the *corpus delicti* first—to show that somebody was killed before you can try somebody else for killing him. For the same logical reason, I want it first established wherein the working mind of Darwin was defective—instances where his observation was not wide enough or close enough—instances where his reasoning was illogical or inconclusive—instances where another mind, educated in another way, has, under like conditions and dealing with like material, done better. When we have such facts before us, we can intelligently inquire as to their causes.

In the meantime, I shall reiterate that the evidence now before us indicates that a strict, rigid, or even narrow classical education furnishes the best possible training for the working mind of the future naturalist.—Respectfully, etc., etc., C. C. N.

Washington, January 27, 1888.

Notes.

'Uncle Sam at Home,' by an English resident in the United States, whose humorous views of our social, political, and financial being will be seasoned with pictorial illustrations, is shortly to be published by Henry Holt & Co.

Ticknor & Co., Boston, will make a volume of the Mendelssohn-Moscheles correspondence exemplified in the February *Scribner's*. They announce also 'The Ethics of Boxing and Manly Sport,' by John Boyle O'Reilly; and 'Harvard Reminiscences,' by the Rev. A. P. Peabody, with a portrait of the author.

Chas. Scribner's Sons have in press 'Society in Rome under the Cæsars,' by William Ralph Inge, M.A.

'American Fishes,' a popular treatise on the Game and Food Fishes of America, with special reference to habits and modes of capture, by Prof. C. Brown Goode, U. S. Commissioner of Fish and Fisheries, will be brought out in March as a subscription work by the Standard Book Co. of this city.

The next publication of the Dunlap Society—the second of the Society's second year—is a 'Life of Thomas A. Cooper,' by Mr. Joseph N. Ireland, now printing at the De Vinne Press. It will have for a frontispiece a reproduction of a rare portrait of the actor who stood at the head of the American stage for many years.

To the "Knickerbocker Nuggets" series (Putnams) have been added Lord Chesterfield's 'Letters, Sentences, and Maxims,' with Sainte-Beuve's critical essay on this writer prefixed in an English form; and 'The Adventures of Baron Munchausen,' compiled from the original English edition (taken over bodily), the near-

est German edition, and from the English sequel, and with a few illustrations interspersed.

Dr. Smiles's 'Life and Labor' (Harpers), like others of his well-known works, is a perfect repertory of anecdotes of noted men and women of all times. These are grouped under various headings, as "Great Young Men," "Great Old Men," "Evening of Life," with a running commentary which is usually apt and well put. There are also suggestive chapters on "Health-Hobbies" and "Over Brain-work," which it would be well for all men to read who are attempting "to get thirty shillings out of their pound." For desultory readers, and for speakers or writers who desire a telling illustration, this book will prove especially valuable, while to the young many of the facts related must act as a healthy stimulus. There is, we are glad to say, an excellent index.

Neither of the two American editions of Darwin's 'Voyage of the *Beagle*' is so attractively dressed as that just issued in London and New York by T. Nelson & Sons. There must be a renewed interest in this immortal work growing out of the Life of Darwin, which is now the delight of thousands of readers. The 'Journal of Researches' would stand in the forefront of works of travel even if the author had died on completing it; but, *pace* the Duke of Argyll, who recommends it because "we have Darwin here before he was a Darwinian," one can now see plainly in it what the readers of 1842 could not, the germs of the doctrine of Evolution which so many years of the most patient and candid reflection and observation were ultimately to fructify. A frontispiece view of an atoll, and a bit of Tahitian scenery as a title vignette, are the only illustrations of the present edition. Some day we may hope for a worthy treatment of the work in this respect, with the aid of the camera. Meanwhile, with Mr. Darwin's cordial approval, a compilation primarily for the use of children, but quite as enjoyable by adults, was made under the title 'What Mr. Darwin Saw in his Voyage round the World in the Ship *Beagle*,' and handsomely published a few years ago, with a large number of pertinent illustrations, by the Messrs. Harper.

We owe to the anti-saloon movement the 'White Ribbon Birthday Book,' edited by Anna Gordon, illustrated in color and otherwise by Mary A. Lathbury, and published at Chicago by the Women's Temperance Publication Association. The select passages in prose and verse are all from the writings of women, many eminent, yet not in a sufficient proportion to make the literary level a high one.

Prof. R. B. Anderson's popular 'Norse Mythology' has just appeared in a Danish version made by Dr. Fr. Winkel Horn from the fourth edition ('Nordisk Mythologi,' Christiania: Alb. Cammermeyer). Those who know Horn's rank as a translator of the Elder Edda, and an authority in what pertains to Northern antiquities, can appreciate the compliment thus paid to author and book. But there is an even greater distinction in the fact that, as we believe, no foreign work on the same subject has ever been translated into any Scandinavian tongue. Dr. Horn furnishes a biographical sketch of our minister at Copenhagen, and a capital likeness of him is prefixed to the handsome volume—a genuine "product of American industry" even if manufactured abroad and in a foreign tongue; and yet (we will put the barbarous fact on record), though bearing an inscription from the author to a countryman at home, it was admitted into the United States only on payment of a customs duty!

The two freshly bound volumes of *Harper's Magazine*, numbered 74 and 75, show that the editor is to be classed among those "whose hearts have a look southward." Mrs. Rebecca Harding Davis's "Here and There in the South," Mr. Charles Dudley Warner's "South Revisited" and "New Orleans," Mr. Gayarré's "Sugar Plantation of the Old Régime in Louisiana," Mr. Brown's "Kentucky Pioneers," Edmund Kirke's "Southern Gateway of the Alleghanies," and Mr. Coleman's "Recent Movement in Southern Literature," form the noticeably strong array of papers touching the southern half of this Union, still a land unknown and full of surprises for most of us. But also there are papers on Mexico, Costa Rica, and (especially valuable) on Chili and the Argentine Republic. Russia, on the other hand, is pretty well looked after in Lansdell's "Natives of Siberia," Meeker's "Through the Caucasus," Millet's "Campaigning with the Cossacks," and Heard's "Russia of To-day." Howells's "April Hopes" and Blackmore's "Springhaven" have led the serial fiction. A great many portraits adorn such collective articles as Coquelin's "Acting and Actors," Theo. Child's "Comédie-Française," "The New York Police Department," and "The Irish Party," but there is no *chef d'œuvre* in this line of engraving.

In *Harper's Weekly* for 1887 the South has the attention paid it of a regular Supplement, besides what it gets from the President's tour in the same quarter. Here there is no lack of portraits, that of Tolstoi and the engraving after St. Gaudens's Lincoln ranking easily first in interest. The pictorial epitome of the year embraces the anniversaries of Wilhelm I., Victoria, the Pope, Whittier, of the Constitutional Convention; the *Thistle-Volunteer* races, the trial of Jacob Sharp, the hanging of the Chicago Anarchists, the Grévy-Carnot succession. An illustrated University series distinguishes this thirty-first volume of the *Weekly*.

From the same publishers we have the twentieth volume of *Harper's Bazar*, and *Harper's Young People* for 1887, which it would be superfluous to characterize.

We are sorry to learn from the Providence *Book Notes* of the suspension of the *Rhode Island Historical Magazine*, published at Newport, and of the *Narragansett Historical Register*.

Two posthumous works of the late Charles Wesley Tuttle, 'Capt. Francis Champernowne' and 'The Dutch in Acadia,' are to be edited and published by Mr. Albert H. Hoyt. Mr. Tuttle died in the practice of the law after an astronomical career not a little remarkable, especially in its origin, as is related in the January number of the *New England Historical and Genealogical Register*, which also gives a portrait of him. In the same number are to be found Mr. Abner C. Goodell, jr.'s, remarks a year ago on Mr. Henry F. Waters's English researches, the speaker contrasting by the way Mr. Waters's method with the late Col. Chester's, which is set forth on p. 83 from the original prospectus. The "Gleanings" contributed by the former to the present number relate, among others, to William Mullins, a *Mayflower* passenger, and the father of that Priscilla whom Miles Standish courted and John Alden won; his will being given. The Sedgwick family of Charlestown is also illustrated by many documents, and Joyliffes, Greys, and Greenes come in for a share of attention. Of general interest is Mr. Benjamin Rand's extended account of the Rev. Aaron Cleveland, great-great-grandfather of the President, whose pedigree is as fully traced as may be. The clergyman in question was a graduate of Harvard in 1735. For a time he ministered in Halifax, and died at the house of Benjamin Franklin in Philadelphia on August 18, 1757. He was, said Franklin, "above every species of meanness and dissimulation." Mr. Richard H. Greene caps Judge Richardson's list of Harvard alumni who have held official position with a corresponding list for Yale. Ninety-two presidents of colleges are enumerated.

Mr. William Archer's papers on the "Anatomy of Acting," now appearing in *Longman's Magazine*, will be revised and enlarged into a little treatise on the histrionic art. Among the distinguished performers on this side of the Atlantic who have answered his circular of inquiry at length are Mr. Dion Boucicault and Mr. John Drew.

Dr. John Murray of the *Challenger* contributes to the *Scottish Geographical Magazine* for January an instructive paper "On the Height of the Land and Depth of the Ocean." After a careful comparison of the most recent surveys, he concludes that the mean height of the land is 2,250 feet, or more than twice the height given by Humboldt in the beginning of the century. The latter's error probably consisted mainly in underestimating the height and extent of the great Central-Asian plateau, of which nearly a million square miles are at an elevation of over 12,000 feet, 7,800 miles being above 24,000 feet. The mean depth of the sea, on the other hand, is 12,480 feet, the deepest seas as well as the highest land being in the northern hemisphere. It is a curious fact that while 90 per cent. of the land is lower than 6,000 feet, only 17 per cent. of the sea-bed is shallower than this, so that if the surface of the whole solid land should "be reduced to one level under the ocean, then the surface of the earth would be covered by an ocean with a uniform depth of about two miles." An excellent map accompanies the paper, which is followed by a discussion of the vexed question as to the course of the African river, Welle, the writer advocating the theory that it is the upper waters of the Itimbiri, a branch of the Congo.

The principal paper in the January Proceedings of the Royal Geographical Society is by Mr. D. D. Daly, who gives an account of his recent explorations in British North Borneo. The most interesting part relates to the collection of edible bird's nests. He visited some limestone caves in the eastern part of the island a considerable distance from the coast, in which they were to be found in incredible quantities. One of these caves was 900 feet high, and was inhabited by such myriad swarms of swifts that "a steady column of these birds has been timed by watch to fly for three-quarters of an hour from one of the apertures." Little control is exercised over the collection of the nests, they being taken in some places six times in the year, while in Annam only three harvests are allowed. A favorable report of the prospects of the colony was given, the imports having increased within six years five-fold, and the exports nearly as much. Head-hunting is nearly exterminated. The Rev. A. Hetherwick gives a description of a journey last year in the region to the southeast of Lake Nyassa. Both papers are accompanied by maps.

At the last meeting of the French Geographical Society, M. Aristide Dumont advocated the construction of a railway from the mouth of the Orontes to the Persian Gulf. He estimates the cost of construction, which would present no peculiar difficulties, at $50,000,000, affirming that if "only a quarter of the passengers who now go by the canal should take the rail, the expense would be justified," without taking into account the local traffic. Not only would ten days' time be gained between Brindisi and

Bombay, but the building of the railway would naturally lead to extensive works for draining and irrigating the great plains of Mesopotamia, thereby restoring them to their former fertility and vastly increasing their population.

The condition of French Indo-China was the subject of an address before the Société de Géographie commerciale on December 21, 1887, by M. de Lanessan, deputy of the Seine, who has just returned from a Government mission to that country. He spoke very plainly, saying that, with the commercial system now in force there, "we shall never be able to draw any advantage from the countries of the protectorate." Again, referring to the severe restrictions upon all except French imports, and the multitude of custom-houses and officials, he says: "We are ruining Cochin-China. We have built there palaces and churches, but we have made neither roads nor canals, and are merely fattening a crowd of absolutely useless officials." While thinking that the French are deceived as to the value of Tonkin, he believes that in four years, with a wise, prudent, and economical government, it can be made self-supporting.

M. Paul Bert's brief administration of Tonkin was especially characterized by his great interest in providing means for the education of the people. From a report of the Director of Public Instruction, recently published at Hanoi, we learn that while on M. Bert's arrival there were only three schools in which French was taught, there are now a college for interpreters, primary schools for both boys and girls, a free school of design, and 140 "écoles libres de caractères latins." These are very numerously attended, chiefly by adults, the studies being the Chinese characters and the transcription of Annamite into Latin letters. In the college are taught French, Annamite, and diplomatic Chinese, which differs in many respects from the language either of the people or the literates.

The recent meeting of the Hygienic Congress at Vienna has done good service in calling attention to the subject of school hygiene, and especially to an evil more or less common in all German schools. In the discussions before the Congress the undoubted increase of nearsightedness among school-children was declared to be in no small degree due to the wretched typography of the text-books in use; the editions of the modern classics, in particular, being for the most part so poorly printed that their use must of necessity be extremely injurious to the eyesight of the pupils. The Austrian Minister of Public Instruction has, in consequence, issued a circular instructing the school authorities to exercise a strict supervision over the typography of the school-books, and to see that it is in conformity with hygienic principles. They are further instructed to discard at once from class use and from school libraries all books which do not fulfil this condition, and to replace them by such as can be used without risk to the eyes. Among the editions condemned by this decree are those published by P. Reclam of Leipzig, the series known as "Meyers Volksbücher," and the editions of modern classics issued in the "Collection Friedberg und Mode." It is to be hoped that the crusade against these abominably printed, almost illegible books may be vigorously carried on, not only in Austria, but throughout Germany, and that it may end in the general adoption of Roman type.

Mr. Townsend MacCoun, 150 Nassau Street, sends us the promised plan of the Athenian Acropolis drawn by Mr. S. B. P. Trowbridge of the American School, to show the results of the latest explorations of that classic site. The lithographed plate measures 22x15 inches, is lettered in English and in Greek, and marks by arrows the direction of monuments beyond its own scope. Its use in teaching is obvious. For private reference it would be well if it were sold mounted and folded.

The ancient Sanskrit writer Kalidasa's drama "Urvasi," in a free German translation by Lodedanz, with music by Grandaur, which had been performed in private before King Ludwig II. some two years ago, was publicly given for the first time in the Court Theatre, Munich, on December 19, 1887. The play was greeted by a full house, and, as a spectacular exhibition, is said to have been the finest ever seen on the Munich stage; the decorations, costumes, lighting, etc., calling forth enthusiastic applause. As a play, however, it is too barren of incident and sensation to satisfy the modern theatre-goer, according to the critic of the *Allgemeine Zeitung*.

The Italian poet Giosuè Carducci on January 8 delivered in Rome a lecture entitled 'L'Opera di Dante,' which has since been published at Bologna by Zanichelli.

Madam Mario, widow of the Italian patriot, Alberto Mario, has just presented to the city of Milan the secret proceedings and correspondence with the army and with Turin of the Provisional Government of Lombardy from March to August, 1848. They had been preserved by the late Dr. Agostino Bertani, and deposited with the Marios. Carlo Cattaneo made use of them in his *Archivio Triennale*, and Bertani obtained them from his effects.

The fifty-sixth annual report of the Trustees of the Perkins Institution for the Blind at South Boston, Mass., presents in great detail the case of a little blind deaf-mute whose instruction deserves to be recorded if not ranked with that of Laura Bridgman. Mr. Anagnos says of Helen Keller, the loss of whose faculties began at nineteen months, before she could talk, and whose enlightenment was undertaken by Miss Annie M. Sullivan six years afterwards, that "the total sum of the knowledge which she acquired in four months exceeds that which Laura Bridgman obtained in more than two years." Numerous facsimiles illustrate the interesting narrative. The first annual report of the Kindergarten for the Blind is added to the pamphlet.

The annual report of the President of Ohio State University shows that in 1886-'87 13.7 per cent. of the whole number of students were women. He expresses surprise that he has never received a single inquiry concerning instruction in household economy. The elective system has been tried and found satisfactory in the main: "genuine interest in study has been promoted." The demerit system has been abolished, even to dispensing with the record of absences at chapel. "The marking of rolls during the progress of religious exercises, or even at a meeting held for religious exercises, seems to be incongruous, not to say irreverent, and tends to counteract in many minds the salutary influence which the worship might otherwise have." The President would also be glad to make chapel attendance purely voluntary. The Harvard leaven is working.

—Letters, like books, have their fate. Little could Mendelssohn have imagined that the letters he wrote to his friend Moscheles would be printed for the first time half a century later in an English translation in an American magazine. The February *Scribner* contains a number of these letters, with comments by W. F. Apthorp, and the March number is to contain some more. They are from the MSS. in the possession of Felix Moscheles, and are accompanied by five fine portraits, a cast of Mendelssohn's hand, and other illustrations, some of which indicate that Mendelssohn, like Goethe, had some talent for sketching. The letters are of more than average interest, but their critical tone will surprise those who think of Mendelssohn's character as being as suave as his music. Wagner himself rarely made more caustic remarks about his contemporaries than Mendelssohn does about Liszt, Berlioz, Heller, Chopin, and others. Mr. Apthorp comments on this, that Mendelssohn must have instinctively felt and abhorred the powers that were destined to partially dethrone him in the concert hall. Prof. Shaler writes very fully of volcanoes, both descriptively and scientifically, and he endeavors to point out to us the great utility of these terrible vents which, of all natural objects, have been the most destructive of a belief in nature's beneficence, and, together with tornadoes, pestilence, and famine, have been devoted, from old time, to the ministry of heaven's most immitigable wrath. Prof. Shaler reckons that the Java group have ejected into the sea within a century twenty times as much matter as the Mississippi has carried down on its current, and thinks it not unlikely that the ocean obtains as much solid material from the volcanoes as from the rivers. In several other ways, also, he finds them a restorative agency. Mr. Joseph B. Bishop contributes an article upon the general subject of the means to be used to take the printing and distribution of the ballot out of the hands of the managers of the campaign funds, and discusses incidentally other ways of limiting the use of money in the electoral machinery. The paper is well informed and timely, in connection with the proposed statute in this State. Prof. William James writes, from a scientific point of view, upon the Will, and analyzes what goes on when an act of volition is performed, as a physiological psychologist sees such phenomena. Mr. Stimson's novel takes us to a pleasanter region than in its first chapters, and to more attractive characters, drawn without satire and touched by the fondness he has before shown for Berkshire; while Mr. Wendell's story, very carefully studied in its setting and movement, pushes audacity so far as to give us, as the children say, a "truly" ghost.

—The October-November number of the *Library Chronicle*, which has just come to hand, contains the interesting and important paper "On the Present Aspect of the Question, Who was the Inventor of Printing?" read by Wm. Blades before the British Library Association at the Birmingham meeting last September. Going back to 1870, when the Costerians, as he says, never were stronger—on their side being Bernard, Ottley, Holtrop, Campbell, Berjeau, Humphreys, and others, including Blades himself—he tells how the publication of Van der Linde's letters to the *Nederlandsche Spectator*, afterwards reprinted in book form, wrought such consternation in the ranks of the Costerians that they threw down their arms, and their rout was considered final, for even the Dutch bibliographers, with the exception of Van Meurs, seemed struck dumb with dismay. In 1871 Hessels translated Van der Linde's book into English, and so impressed was Blades with its importance that, at some expense, he printed it in order that English readers might keep abreast with the new learning, and it appeared under the title 'The Haarlem Legend of the Invention of Printing Critically Examined.' The conclusions of Van der Linde were adopted by De Vinne in his 'Invention of Printing' (1876), and the current of opinion ran strongly against the Costerians.

In 1878 Van der Linde published his 'Gutenberg: Geschichte und Erdichtung aus den Quellen nachgewiesen,' of which Blades justly says, "There is little that is new in this work except its increased bulk. The story of the legend is retold, and, if possible, with more bad taste than before. Great ability is shown in his treatment of the subject, and the author argues throughout like a clever barrister whose fame and future depended upon success." Hessels, undertaking to review this work, spent three years in the examination of sources and documents, and published in 1882 his 'Gutenberg: Was he the Inventor of Printing?' in which he gave a critical study of the whole question, denouncing Van der Linde as altogether untrustworthy, and declaring that he had not found anything which would enable him to answer the question, "Was Gutenberg the inventor of printing?" with either yes or no.

—In 1886 Van der Linde published at the expense of the German Government a large work in three folio volumes, entitled 'Geschichte der Erfindung der Buchdruckerkunst,' characterized by Blades as "a notable piece of bookmaking, sheet after sheet being occupied with mere padding. There is nothing except luxurious printing and a lot of unimportant plates to distinguish it from his former work, 'Gutenberg.'" The publication of this work called forth from Hessels a series of articles on "The History of the Invention of Printing," which appeared in the *Academy* (April to August, 1887), and have recently been revised and issued in book form under the title 'Haarlem the Birthplace of Printing, not Mentz.' Hessels here vigorously disputes Van der Linde's conclusions, denounces his blunders, exposes his pretensions to original research, and advances his own reasons for attributing to Haarlem the earliest attempts at types. After having given an outline of the course of the controversy, Blades briefly states the main facts adduced in support of Gutenberg's claim, and asks: "To what, then, does the evidence so far point? This—that Gutenberg was a famous printer, who was the first to bring his art to that perfection which we trace in the Mazarine Bible and in the beautiful Mayence Psalter, printed by his associates and successors, Fust and Schœffer." He next gives an outline of the evidence on the Costerian side, the narrative of Junius, the statement of the Cologne Chronicle, and the so-called 'Costeriana,' which Van der Linde places about 1474, while Hessels assigns them to the period 1446-74. But though Hessels believes that the Coster mentioned in the archives as living in Haarlem, 1436-83, was the inventor of types, Blades would like to wait for more evidence, and urges the thorough examination of the ancient bindings of incunabula in the great libraries of Europe, saying that "the more these are examined the longer will be the list of 'Costeriana,' and it is quite probable that somewhere will be discovered a date or a fact which will turn the probability that Holland was the birthplace of printing into an acknowledged historical fact." At present he admits that, however strong the circumstantial evidence in favor of Holland may be, the verdict cannot be given positively to either party, although he has little doubt as to which side all future evidence will tend towards. These expressions, coming as they do from an authority at once so competent and cautious, must carry great weight, and will incline many to falter in their allegiance to Gutenberg.

—The same number of the *Library Chronicle* contains the paper read at the Birmingham meeting by F. Madan of the Bodleian Library, entitled "What to Aim at in Local Bibliography," in the first part of which he gives some valuable suggestions, derived from his own personal experience, as to the method to be pursued. He recommends the formation of five lists, the first of which should be a list of printed books and pamphlets relating to the town or district; in this list he insists that the arrangement should be chronological, not alphabetical, nor according to subject, but provided with author and subject indexes. Next there should be a collection of slips containing references to MS. material for local history, and for this list he prefers a subject arrangement. The third list should be of plans, maps, and engravings, also arranged according to subject. The fourth list should be one of "fugitive pieces," including under this term, in general, pieces of less than five pages, such as fly-sheets, addresses, lists, and appeals. "Of these fly-sheets there should be a rough list on a chronological basis; not so detailed as to wear away one's life, but sufficient to distinguish each piece from every other." Lastly there should be a complete chronological list of all the books printed or published in the town or district, a history of the local press. In the second part of the paper he attempts to distinguish between sanity and insanity in the work—that is, between the limits of reasonable energy and of unreasonable or misdirected enthusiasm. The first principle he lays down is this: "If our locality be so small or unhistoric that there is very little to record, record the whole of it; if there be too large a literature for that, then *separate*, *criticise*, *decide*." A few examples of debatable ground are given; thus, in the matter of sermons, he would neglect all sermons which do not contain allusions to local history. The newspaper has superseded the necessity for collecting *everything*, but special attention should be paid to fugitive pieces relating to societies, clubs, etc., not likely to be preserved in the newspapers. Again, all books privately printed in a place should be procured, if possible, and entered in the list. The person who should do this work is the local librarian.

—It would seem as if all possible expedients for protecting the rights of authorship had been discussed of late; but here is one which has escaped general notice, despite its efficacy, which is beyond question. A work entitled 'Albertus Magnus: approved and verified, both sympathetic and natural Egyptian secrets, for man and beast' (we dare not tamper with the phraseology or punctuation), was published at Harrisburg, Pennsylvania, in the year 1875. It belongs to a class of "magic-books" which, in English or in German, have to this day some circulation among the Pennsylvania Dutch. The preface to the second volume closes as follows:

"Inasmuch as, at this juncture, all looks so gloomy in society, the writer of this expects that no pirate of books will wrongfully seize this work and reprint the same, if such an one does not wish to incur the eternal curse and even condemnation from such an act. While we recommend it to the protection of God and the Holy Trinity, that they may be watching the same, and set the angel Michael as watch and guard over the undertaking, so that no pirate may rob the real and legal owner of the means of deriving his daily bread from the sale of this publication, and cheat him of his property by the peril of losing his blessedness, such a being would never find rest nor quiet, by day or night, neither here below nor in the hereafter, by seeking to defraud the publisher of his own. This would God the Father, Son, and Holy Spirit grant. Mirathe saepy Satonich petanish pistau ytmye higarin,"

and four more lines of what we take to be a cabalistic anathema upon the aforesaid pirate. The proof of the pudding is in the eating. Here is a book which never was copyrighted, and which has yet defied piracy for upwards of twelve years. Success begets respect; and one turns with interest to the body of the book, which may be heartily commended to such as would know how "To Cause a Witch to die within one Minute."

—It sounds a little odd when the motive of a State historical document is confessed to be the fact that "New Englanders will occasionally assert that New York did very little to assist her sister colonies in the struggle for independence more than one hundred years ago." This avowal introduces the preface to vol. xv of 'Documents relating to the Colonial History of the State of New York,' edited by Berthold Fernow (State Archives, vol. i.—The Revolution). Upwards of 600 quarto pages embalm some 40,000 names of men who served in a military or naval capacity during the Revolution. This aggregate does not appear to be exhaustive, even disregarding the defects of the archives at Albany and at Washington, for "in giving the names of the officers and of a few men of the first and second 'Continental Establishments' [*i. e.*, first and second calls by the Provincial Congress in 1775, 1776], the Editor has tried to avoid repeating lists of names, etc., already published in the 'Calendar of Revolutionary Papers,' two volumes, published by authority of the State in 1868." He first prints pertinent extracts from the Proceedings of the Provincial Congress, the Committee of Safety, and the Convention of New York relating to Military Matters. These naturally contain the only readable portions of the volume, and a good deal may be found in them about "the people called *Green Mountain Boys*," living in "the several Townships on the New Hampshire Grants, West of the Range of the Green Mountains," their uniform when enrolled (a green color), "the disputes already subsisting among their chiefs, the principles whereof we are strangers to," etc. Capt. Alexander Hamilton is ordered to put a guard of his artillery company over the colony records, till relieved by Col. Lasher's Independents under an order of Gen. Putnam's. There are a number of communications from John Hancock. In a footnote to page 132 the editor gives an estimate of the population of the colonies in 1776, which foots up 3,680,000, or a million more than Prof. F. B. Dexter of Yale has recently allowed as the result of his investigations. There are very full indexes of names to this valuable work.

—The last *Revue Bleue* of 1887 is a memorial number, devoted to its founder and *directeur*, M. Eugène Yung, who died December 26 at the age of sixty years. Many, even among the constant readers of the *Revue* which he conducted, know little more than the mere name of this active and able literary worker, who from the beginning of his career did so much to encourage and bring forward, and even in a measure to form, young and unknown writers who later became authors of note. M. Jules Lemaitre, writing of him with affection and admiration in the *Journal des Débats* of December 27, expresses his own gratitude to him, relating how, when his first article fell under the observation of M. Yung, he inquired out the young author, who was as delighted as he was surprised to receive, in the little provincial town where he was professor, the letter in which it was proposed to him to write for the *Revue*. "My coming to Paris I owe to him: if I have worked well, to him I owe it." In another place he says, "There are many of us who owe much to Eugène Yung," and he explains how the young writers whose promise M. Yung had recognized put aside, under his guidance, their youthful affectation and bad taste, and ma-

tured and developed more quickly all they had in them that was good. The same thing is said, not only by other young writers whose early attempts in literature were made in the *Revue Bleue*, but by men of long-established reputation, his comrades of the *lycée* and the École Normale—Weiss, Sarcey, Dionys Ordinaire. The last of these, who is not only a member of the Chamber of Deputies and a journalist, but also one of the familiar writers of the *Revue Bleue*, speaking of their conversations about his articles, says, "We would dispute about a title, a phrase to be struck out, a word, a period, and it was always he in the end who proved to be right, for he was good sense embodied, and, besides, he possessed an exquisite literary delicacy and tact." M. Weiss calls him an "inventeur d'esprits"; M. Sarcey says of him, "He was a born *directeur de journal*, or, to use a broader expression, a born *impresario*," and then, in his usual lively manner, Sarcey shows him in the exercise of his functions as secretary to Buloz of the *Revue des Deux Mondes*, a position he seems to have won by the striking ability displayed in his thesis for his doctor's degree, 'Henri IV. considéré comme écrivain,' which, singularly enough, is the only thing of all he has written which remains as a volume. Sarcey tells how Yung wrote to him, then an unknown professor in a provincial *lycée*, asking him for an article for the great *Revue*, of which he traced for him the general plan and arrangement, and indicated the length advisable. Sarcey refused, not suspecting then that he too was destined to become a writer. And he adds that this attempt was probably often made with others, for he was not among Yung's intimates at the École Normale, nor even in his class. He seems to have had an instinctive appreciation of promising literary talent; he sought it out and excited it.

—If it was not to Yung that Sarcey owed his entrance into literature, it was he who forced him, in spite of himself, into the *conférence*, in which he has since won some of his greatest successes. He had lectured only twice, and made such a complete failure that he had sworn never again to address an audience. With many entertaining details he relates how he was persuaded to break his vow by Eugène Yung, who had had a new hall placed gratuitously at his disposal for lectures, but who had neither lecturers nor a public. He found both. Without putting himself forward, with discretion and patience that never failed, "il sut mettre en branle toutes les cloches de la publicité." He had articles everywhere—articles inspired, almost dictated, by himself; not vulgar puffs, of which he had a horror, but interesting and solid and even learned articles, which were irresistibly attractive. It became the fashion to attend these lectures; ladies in full dress came to listen to them before going to a ball; the memory of their success has become a tradition among Parisians. For lecturers he had, of his comrades at the École Normale, Taine, Weiss, Deschanel, Sarcey. Yung himself never spoke, never appeared, although it was he who guided and moulded the whole. His personal withdrawal from publicity, his moderation, and his talent for organization won for him a great influence in the Paris of the last years of the Empire. In a charming and touching page at the beginning of this memorial number of the *Revue Bleue*, M. Weiss, one of the oldest of his friends, recalls the events of the life of Eugène Yung. They were in the same class in the Collège Louis-le-Grand as boys, and the École Normale as young men; they taught together in the same *lycée* at La Rochelle. When Yung became secretary of the *Revue des Deux Mondes* under Buloz, his first thought was to open its pages to his friend; when Weiss went to Paris to write editorially in the *Journal des Débats*, he induced the *directeur* to give Yung also a place on the paper. They were both Protestants, and both held similar liberal doctrines in politics and in literature, though Yung was less conservative, having been a republican from the days of 1848. He did not enter directly into politics, either personally or by his writings; but, by the various courses of lectures which he directed as well as by the *Revue* he founded, he influenced public opinion powerfully and durably during the period which prepared for the coming of the Third Republic, when in both fields the open discussion of political questions was impossible. The *Revue Bleue* had very modest beginnings. The first weekly number appeared in December, 1863. It was then called the *Revue des Cours Littéraires*, and was little beyond the reproduction of some of the most marked among the lectures and lessons of the Collège de France, the Sorbonne, and the higher schools. After the Franco-Prussian war, its title was changed to *Revue Politique et Littéraire*, and this in turn became familiarly the *Revue Bleue*, on account of the color of its cover—a title which a year or two ago was officially adopted. It is this weekly periodical, which has grown gradually into something quite singular of its kind, intermediate between the daily newspaper of the best class and the great *revues*, which Eugène Yung directed and managed for twenty-five years, and which remains his best monument and memorial.

GARIBALDI'S MEMOIRS.

Memorie di Giuseppe Garibaldi. Florence: Barbèra.

The enterprising firm of the Barbèra brothers announces "ready for publication, the Autobiography of General Garibaldi," and the announcement will be received with pleasurable surprise, because, at the time of the General's death, in 1882, it was affirmed that these Memoirs were not to appear for at least ten years. The single volume of less than five hundred pages of which we have been favored with the proof-sheets, is issued without any attempt at editorship, with no preface save the author's own. The work is divided into five parts. The first period commences with reminiscences of Garibaldi's childhood. An affectionate tribute is paid to his worthy father, his worshipped and really angelic mother. Then, after a description of his seafaring life, barely alluding to his share in young Italy's adventures, "an exile and condemned to death," he narrates with evident gusto every detail of his South American experiences, his meeting with Anita, the formation of the Italian Legion in Montevideo, its heroic combats, alternate defeats and successes, the crowning victory of S. Antonio, the refusal of himself and his legion to accept the land and rewards offered them; ending with slight biographical sketches of such dead and wounded as he remembers. The second period embraces the revolutionary year of 1848, the war against the Austrians, the defence of the Roman Republic, the disastrous retreat (ending with the death of Anita), his second exile, his sojourn in the United States, his return to political life, the Franco-Italian campaign against Austria in 1859, his sojourn in Central Italy. The third period is entirely devoted to his grand campaigns for the liberation of southern Italy, starting with the famous Thousand from Quarto in May to the last combat at Caserta Vecchia on the 2d of October and his return to Caprera. The fourth period embraces Aspromonte, in 1862, the campaign of the Tyrol in 1866, the attempt on Rome in 1867, ending with the disaster of Mentana on the 3d of November. The fifth and last period closes with the French campaign, and then, as "an Appendix to my Memoirs, Civitavecchia, July 15, 1875," we have a short but admirable criticism on the battle of Custoza.

We do not attempt here any critical review of this autobiography *sui generis*. As a general rule, criticism is only fair when the work itself is before the reading public, and a translation of these Memoirs for foreign readers would need a very careful preface or appendix in which the chief historical facts and dates of Italian revolutions should be given. From the testimony of Guerzoni, in his life of the hero, and from our own memory of chapters and paragraphs shown or read to us by the General himself, at different periods of our thirty years' intercourse, we see that he has purposely omitted from the "Memoirs to be published" a number of documents and facts that he had consigned to paper, just passing from one campaign to another without any connecting links or explanatory circumstances. A translator's preface would have to supply this deficiency, and also publish a number of admirable letters written by the General himself to the King, to Mazzini, to Cavour, and to other important personages with whom he was brought in contact by political affairs. As in life so in his records, he never understands or appreciates Mazzini, and, with the fullest intention of being just and generous, falls into numerous errors of fact. All these, we may be sure, will be rectified by Aurelio Saffi, Mazzini's fellow-triumvir, devoted disciple, and conscientious biographer.

Again, we regret that the General's letter to the Papal Nuncio in Montevideo, offering his services to Pio Nono in 1848, is omitted, as the letter and the offer would have sufficed alone to explain Garibaldi's constant attacks on priestcraft and priests, which will offend unnecessarily devoted Catholics and yet faithful subjects of the King of United Italy, honest citizens in every way. The fact that the papacy has been for centuries the obstacle to the formation of an Italian nation by summoning foreigners to Italian soil; Pio Nono's conduct in 1849, when he blessed the Croats as his beloved children, and withdrew his troops from Lombardy when, united with the Piedmontese and the volunteers, they might have expelled the Austrians from the Peninsula; the four foreign armies summoned to replace the Pope on his throne of "4,000 corpses"; the last final summons of the "marvellous chassepots" to drive out Garibaldi and his volunteers from the Roman Campagna after the victory of Monterotondo—filled the great patriot's heart with such grief and indignation that he feels himself compelled to vent it on every occasion and apropos of every event.

The Memoirs will be eagerly devoured by Italians, while foreigners will be especially pleased by its simple narratives and admirable military criticisms. Here Garibaldi is perfectly impartial; even while narrating the great field-battle of the Volturno, he dwells far more on the defects of his own military plans than on the almost miraculous feats performed by his handful of volunteers electrified by his voice and eye. Perhaps the following extracts from the tenth and eleventh chapters of the second period may serve to give an idea of the matter-of-fact way in which he accepts the ups and downs of life, attributing his hardships to circumstances rather than to men, feeling more surprise than anger when they are specially untoward, even as, when things went contrary, his

one remark ever was: "C'est un fait, c'est singulier!" At the time referred to in this extract, life looked gloomy to him in every sense. Rome had fallen. The French were entering Rome:

"Mr. Cass, the American Minister, knowing the state of affairs, sent word on the 2d of July, 1849, that he wished to speak to me. Going to his house, I met him in the street. He, in the kindest manner, placed an American man-of-war, lying off Civitavecchia, at my disposal, giving me leave to go on board with such of my comrades as might run risks by remaining. I thanked the generous representative of the great republic, telling him, however, that I meant to leave Rome with all those who chose to accompany me, and try yet to achieve something for our country, whose fortunes did not seem to me even then altogether desperate."

There follows the harrowing description of that attempt — France and Austria joining hands to seize the dreaded "red devil," and to disperse his followers, the Tuscans shutting their gates at his approach, the inhabitants of the Romagna turning a deaf ear to his appeal. He is heart-sick at the state of Anita, who, though already ill, had shorn her hair and dressed as a soldier to follow her beloved, and to all his remonstrances (she was on the eve of becoming a mother for the sixth time) making answer: "You wish to abandon me." His men desert, he reaches the republic of San Marino, where, he says: "On the steps of a church outside the city I wrote the following proclamation: 'Soldiers! I absolve you from your pledge to accompany me. Return to your homes, but remember that Italy ought not to be left to the shame of servitude.'" But for him and his few faithful ones surely Venice is left to die in? Not so. Just as he sights the lagoons, the Austrian men-of-war discover and attack his tiny fleet of fishing boats. Anita is dying, he carries her in his arms to a peasant's hut, receives her dying kiss, and, before the corpse lying in his arms is cold, he is compelled to abandon it: the Austrians are on his track. Another month of hiding, of danger, of hair-breadth escapes: every man's hand is against him whose hand is only raised against the foes of Italy. Finally, a fisherman volunteers to go for his boat and convey them in safety to the Ligurian shores, if meanwhile they can lie in hiding in the woods along the shore between the sea and the Maremma. They succeed, and the fisherman comes with his boat.

"There, in the harbor of S. Sterbino, the little craft awaited us, and we embarked, touched by the proofs of affection lavished on us by our generous liberators. . . . How proud I am to have been born in Italy, where, despite the rule of priests and thieves, our youths are growing up to despise dangers, torture, peril, and death, to march calmly to the fulfilment of their duty, the emancipation of their country from her chains.

"In the Genoese fishing boat we sailed for the isle of Elba, to take in provisions and fishing gear, and passed a night and part of a day at Porto Longone. Thence, coasting along the Tuscan shore without stopping at Leghorn, we continued our course westwards. I did not deceive myself as to the unfavorable reception which awaited me on the part of the Government in the Sardinian States, and I was half inclined to ask for a berth on board an English vessel anchored in the port of Leghorn; but the longing to see my children before leaving Italy, where I knew I should not be allowed to remain, prevailed.

"In September we landed safely at Porto Venere. There and at Chiavari nothing new; in this latter city I was received in the house of my cousin, Bartolomeo Pucci, of cherished memory, and we were welcomed by his kindly family, by the population of Chiavari, and by the numerous Lombards who had taken refuge there after the battle of Novara. But as soon as General La Marmora, then royal commissary at Genoa, learnt of my arrival, he gave orders that I should be transferred to that city, escorted by a captain of carabineers in plain clothes. General La Marmora's proceedings did not surprise me; he was but the willing instrument of the policy that then prevailed in our country, besides being on his own account a natural enemy to all who, like myself, were stained with the republican bar sinister. So I was shut up in a secret cell of the Ducal palace in Genoa, thence transported by night on board the war frigate *S. Michele*, treated, notwithstanding, with deference in Genoa by La Marmora and on board by the chivalrous commander, Persano. All I asked was for twenty-four hours to go to Nice and take leave of my children, promising to return to my temporary prison, and La Marmora gave me leave on parole. I don't know whether policemen in disguise were on board the *S. Michele*, but certainly news had been sent to Nice, and the carabineers were on the alert. As usual, the authorities detained me on board for several hours, so that I had barely time to reach Cavas, where my children were, pass the night there, and return at once.

"The sight of my children, whom I was obliged to abandon, grieved me deeply. It is true that they were left in friendly hands; the two boys (Menotti and Ricciotti) with my cousin Augustus Garibaldi, and my Teresita with Mr. and Mrs. Deideri, who were like parents to her. But I had to quit them for an indefinite space of time—this was made clear to me when I was summoned to choose my place of exile.

"And here I cannot pass over in silence the manly defence of my cause assumed by the liberal members of the Piedmontese Parliament, Baralis, Borella, Valerio, Brofferio, who made such a powerful appeal in my favor that if they did not succeed in getting the sentence of banishment revoked, assuredly they saved me from a still harsher fate. The insatiable bloodthirstiness of the Austro-clerical party, victorious throughout the peninsula, was rife even in Piedmont. The hopes I still cherished that brighter destinies were in store for my country suggested my choice of Tunis as a near abode in exile, especially as I knew I should find there Castelli of Nice, a friend of my childhood, and Pedriani, also a friend and fellow-exile of 1834. But, embarked for Tunis on board the war steamer *Tripoli*, I found that the Government, subservient to French orders, would none of me, so I was carried back and deposited on the island of La Maddalena, where I remained twenty days.

"There, ludicrous to relate, were not wanting those who insinuated in the ear of the Sardinian Government (or it may be that they feigned the belief) that I was bent on revolutionizing the islanders, half of whom in those days were pensioners or servants of the Crown. A kindly population they were, though, and they treated me right well! So from the island of La Maddalena I was escorted to Gibraltar by the war brig *Colomba*. The English Governor gave me six days to take myself off. The gratitude and affection which I have ever cherished for the generous English nation made this discourteous, futile, and unworthy proceeding doubly hard to bear. . . .

"Still clear out I must, even if nothing but jumping into the sea was left; and, following the advice of friends, I decided to cross the straits and seek a refuge in Africa, where G. B. Carpeneto, the Sardinian Consul at Tangiers, welcomed me to his house, and, with my two companions and officers, Leggioro and Coccelli, we were hospitably entertained for six months. At Modigliana I found a beneficent priest,* and at Tangiers an honest and generous royal consul, and to both I owe a debt of gratitude. True is the old proverb: 'The frock does not make the monk.' . . .

"At Tangiers, with my generous host Carpeneto, I passed my time as tranquilly and happily as an Italian exile far from his country and his dear ones could expect to do. At least twice a week we went shooting, and game was abundant. A friend lent me a little boat, so we made up fishing parties, and fish also was plentiful. The courteous hospitality with which Mr. Murray, the English Vice-Consul, welcomed me to his house, lured me at times from my solitary and rustic habits.

"Nor did *all* my Italian friends forget me in absence. Francesco Carpeneto, who had been most kind to me from the time of my return to Italy, in 1848, bethought himself of a plan to enable me to earn my living, and tried to collect sufficient money among his own friends and mine for the purchase of a vessel of which I was to have the command. This scheme pleased me; unable to do aught towards the fulfilment of my political mission, I caught at the chance of being able to work, hoping as a merchant-trader to become independent and no longer remain at the charge of my generous and hospitable friends. So I at once acceded to Francesco's plan, and made arrangements to start for the United States, where a vessel might be purchased. In June, 1850, I embarked for Gibraltar, thence for Liverpool and New York. Crossing the Atlantic, I was seized with rheumatic pains, and on landing was unable to stir, was set on shore like a bale of goods, on Staten Island, and, still suffering from my illness, passed a month, partly on that island and partly in the house of my dear and good friend, Michele Pastacaldi, where I enjoyed the friendly companionship of Foresti, one of the illustrious martyrs of the Spielberg. Carpeneto's plan came to nothing; he had only been able to place three shares of $2,000 each with the Camozzi brothers of Bergamo and one Piazzoni, and what vessel in America could be purchased for $6,000? A small coasting vessel, perhaps, but, not being an American subject, I should have been obliged to take an American captain, which would not have paid.

"But something I must do! A kind, sterling Florentine friend, Antonio Meucci, had decided on setting up a candle factory, and offered me work in his establishment. Said and done! Without capital I could not take shares in his speculation, as the $6,000, proving insufficient for the purchase of a vessel, remained in Italy; so I made up my mind to work on whatever conditions should be offered. And for several months I worked with Meucci, who did not treat me like a common workman, but with the utmost kindness as one of the family.

"One day, however, tired of tallow-boiling, and very likely impelled by my natural and habitual restlessness, I left the house, resolved to seek a different employment. I remembered my seafaring life, knew a little English, and so went down to the shore, where coasting vessels were loading and unloading their cargoes. I asked the first to take me as a sailor; those on board the vessel went on with their work, scarcely giving heed to my request. I tried the second, with the same result. Then I passed on to a third, asked some men who were unloading to let me help; the answer was that they wanted no help. But I persisted: 'I don't want pay; let me work to warm myself'—it was actually snowing; no answer whatever. I felt mortified. I lived again in memory the days when I was honored with the command of the fleet of Montevideo and her gallant and immortal army! What did all that avail? I was not wanted now! However, I swallowed my mortification and returned to my tallow-boiling. Most fortunate was it that I had not acquainted Meucci, excellent man, with my resolution; so the vexation, known only to myself, was lessened. And here let me state that nothing in the conduct of my kind master had prompted my untimely resolve; he and his wife, Mrs. Hester, were lavish in their benevolence and friendliness."

How strangely reads this episode now—with the hero of countless victories, the liberator of Italy, lying there on lone Caprera beneath the granite slab, while his countrymen erect monuments in every city to his memory, identifying his name with independence from the foreigner in the past, and hopes for freedom from moral thraldom in the future!

* Don Giovanni Veritas, a patriot priest who saved the fugitives after Anita's death.

McMASTER'S FRANKLIN.

Benjamin Franklin as a Man of Letters. [American Men of Letters.] By John Bach McMaster. Boston: Houghton, Mifflin & Co. 1887. ix., 293 pp. 16mo.

It is almost a century since Franklin died, yet during that time his reputation has had few hard shocks, and he is to-day, as he was when living, a very popular hero. Image-breakers have not of course wholly neglected him, but they have not shattered the aggregate of excellences which make up his fame. The hero of the Autobiography—or what has passed for it so many years—is still cherished, while the warnings of the historically cautious are not listened to. For one unhappy infant who is christened John Adams or Alex-

ander Hamilton, there are a hundred who press on to manhood under the burden of the name of Benjamin Franklin. But the ambition of parents has had in mind the statesman, the politician, the diligent printer, or the thrifty tradesman; probably Franklin the man of literature never had a namesake. It is with the clear advantage of a fresh topic that Professor McMaster approaches a subject about which no author until now has seriously troubled himself. To be sure, Franklin holds, by common consent, at home and abroad, a high position in American letters, which has been accorded him in a generous but uncritical and unconcerned spirit. Mr. McMaster's genius for making entertainment out of all he writes does not now desert him; he could, we think, if he would, make even the authenticity of Shakspere's works a readable matter, and he would have been forgiven had he swollen this one small volume into two. It is plain, however, that he has felt a restraint in passing from the life history of a nation to the closer consideration of one individuality. The unkindest thing one would wish to say of this book is that its author is too fond of a literary coach and six not to find a monograph somewhat slow-paced. The same modesty and the same freshness which were so charming in his larger 'History,' are both here to maintain a growing reputation already enviable.

In no marked degree do the documents lately acquired by the State Department seem to have aided in strengthening previous knowledge about Franklin, or in more sharply defining his place in literature. Valuable as it no doubt is, it appears to be admitted that the "Stevens Collection" is to be chiefly useful for purposes of correction or verification, and that Mr. Bigelow's new edition of Franklin's works, so far as it has been reinforced by these papers, is sufficiently exhaustive and definitive. Mr. McMaster has fallen back upon his usual method of throwing the most brilliant side-lights possible upon his subject. His facile skill in exploring old newspapers and other contemporary sources has enabled him profitably to use materials not commonly yielding rich results to investigators as painstaking though not as dexterous as he. The "accessories" in Professor McMaster's style are often so dramatic or lively as to lend a sort of fictitious interest even to the character of the practical and hard-headed author of the 'Poor Richard Maxims.'

Everything which Franklin wrote or did had some clear purpose in view. There was in his nature no waste of force, and, what is more, no inner life, no intellectual retreat where he should abide apart for a season. His were not the usual habits of literary men, and hence it is, in literary annals, that his cannot be said to be an especially attractive or picturesque figure. He knew little of the horror of garrets, of hunger, or the rebuffs of the powerful. After the first few boyish, though always clever, successes in his brother's paper and elsewhere, he soon grew to know his own powers, and his shrewdness told him when to spread his pinions and when not to attempt vain flights. Success came surely to him after he had outwitted Bradford in Philadelphia, and in his newspaper and his pamphlets and in the Junto he had readers and listeners with whom he could do as he pleased, and therein he had arrived at the Utopia of editors and publishers. The literary Franklin can only be known by close attention to the details of his busy life, and therefore Prof. McMaster has not erred in making a biographical study in which the writings come in for no more than their due and proportional recognition. So large a share of Franklin's literary remains consists of scientific papers of a long out-dated value and of correspondence of quite unequal interest, that nothing could be stupider than a critique of his works apart from a consideration of his vivid personality.

Franklin plainly revealed himself in all he wrote, and this has given an air of sincerity which has much to do with the unbounded admiration still held for him in America, and, it may almost be said, yet more firmly held in Europe. It is not at all to the purpose to ask what manner of man Franklin in reality was; this book, with the wonted courtesy of its author, waives the decision of that question. Franklin laid himself bare to the world almost as unreservedly as did Cellini or Rousseau, and the lesson of his life, down to the final date in the Autobiography, is explicit enough, nor is there the slightest reason to suppose that the Ethiopian afterwards changed his skin, or even wished to perform that miracle. A confession with Franklin was both repentance and absolution. Though not a few refuse homage to the personal character of this most brilliant man of affairs of American history, the evil that he did seems not to have lived after him, at least it is not commonly remembered against him. Nor was the good interred with his bones, for his memory to most people is still of sweet savor.

Prof. McMaster has not, then, set himself the ungracious task of undoing a reputation—such is not the cast of his disposition. He is, however, characteristically frank. To some extent he appears to share in the opinion, openly expressed to this day in Philadelphia, that Franklin was a consummate master of the art of success, financial and political. The subject is not altogether pleasant, yet if any one cares to see how Franklin stands in the eyes of many now living in the city of his adoption, let him turn to Mr. Horace W. Smith's 'Life and Correspondence of the Rev. William Smith, D.D.' (vol. i, pp. 344, 587, and elsewhere). It is noteworthy that in Massachusetts, where ethical judgments passed on public men are surely as severe as they are anywhere, Franklin's popular fame cannot be said to be tarnished. Had anything seriously affecting Franklin's reputation for better or worse turned up in the so-called "Stevens Collection," it is certain that it would have been made good use of in this book, but no such historical "find" has disclosed itself. The one literary performance which might tell us more of the hinted-at Gallic tendency of Franklin's later ethics, will, in all likelihood, never see the light in any common edition of his works, unless Mr. Bigelow decides or is permitted to print it. We do not forget that the late Henry Stevens once announced the publication of this bagatelle, but if it ever was printed, it is now rare with a rarity which that eminent bibliographer could so well effect.

The Franklin whom Mr. McMaster has constructed, of materials which he has been at much labor to collect, is very real, though perhaps there is not quite enough of him, for at times he becomes indistinct in the maze of contemporary life in the midst of which he moved—always the central figure. Vivid indeed are the pages given to the great election of 1764, when Franklin and Galloway ran for the Assembly—an event which is still a live topic in the city where it was held. A remarkable event it was, not only on account of the modernness of its conduct, but because it settled the reputation of Franklin among men of his day, and to some extent for all time. He was so much a man of the nineteenth century that his "methods" in business and politics were those of to-day; the quality of his wit, too, was essentially modern. He always knew a "good thing," and he never neglected the main chance. Now he was recasting and improving adages borrowed from almanacs forty years old when he was born, now making practical use of electrical theories which he found revolving in the mind of the more retiring Ebenezer Kinnersley. One sowed and another watered, his genius gave the increase; the world was the wiser for it, and Franklin waxed fat with success.

There is a fine opportunity, which Professor McMaster neglected to "improve," for moralizing on the impossibility of any man, however great, repeating the successes of Benjamin Franklin. It is simply out of the question that he could, in this age, have been preëminent in so many directions, great as his success might have been in one or a few. A money-making man of to-day, conducting a successful newspaper like the *Pennsylvania Gazette*, which had run off all competitors, and carrying on at the same time a lucrative retail business, could not afford to go into politics. Franklin went on his European errands because he was patriotic and ambitious as well to go, and because, too, he had made enough money to keep him comfortable in any event. Nowadays such a political mission would be ostentatiously made at a "great personal sacrifice." In literature, as in business and statecraft, it should always be remembered that he never had a rival worthy of the name. His mechanical genius was of a direct but not transcendent sort, so that, did he lay sticks for a fire, or hang a door, no one ever seems before to have done the thing at all well. How much of guile or sordidness there was in his nature is not to the point; he certainly was one of the few men of his time to discover that simplicity, like honesty, is a good policy. This unpretentiousness, assumed or not, of speech, garb, and literary style explains much of his success in France. While Lee chafed, and Adams was "respectable" and distant, Franklin was delighting everybody, from Court to populace, by eccentrically minding his own business, meanwhile in reality looking after the fate of a new nation, with his own *bonhomie*, of course. That he walked in the counsel of the ungodly is plainly shown in the flippant but clever pages of Bachaumont, but calumny did not seem to touch his skirts. There is reason to think that he held, as Disraeli did, later, that women's aid is an absolute necessity to political as well as social success. The French Court did not lack, at that time, those who were only too ready to be flattered into usefulness. To the last he was a French wit and man of the world, yet we choose to remember him as making pious and edifying suggestions, in his serene old age, before the Federal Convention, which we forget were dictated by policy as well as by conscience. Results achieved are what his countrymen have been wont to admire in Franklin. Their forbearance towards the manner of his successes and his moral insouciance has been of that easy, tolerant kind, of which Franklin so highly approved in several of his smaller writings.

What he wrote was after all but an outward expression of what he was. Even his *jeux d'esprit*, of which he was so vain, had practical ends. A perfect understanding of his whole life seems unavoidable if we would know his force as a man of letters. Such breadth of treatment may at times have lost sight of the primary object, but it shows a fairness due a great man by placing him on a large stage. More minuteness occasionally would not have injured the general plan. Considering the space given to the subject of piracy, which is suggested by Franklin's juvenile ballad-making on that always fascinating topic, it might be just to complain that further on Mr. McMaster has devoted too

little attention to the vastly more important political meetings. Of some of the most interesting of those papers which best illustrate Franklin's purely literary style, no account is taken, beyond a bare mention of their titles. Some attention certainly should have been paid to Franklin's theories of a revised orthography on a phonetic basis, and of his relations with Webster in this matter—a subject on which little of a satisfactory nature has as yet been written. The memorial to Congress from the Pennsylvania Society for the Abolition of Slavery is unhesitatingly ascribed to the pen of Franklin. This, we had supposed, was not a certainty, although he signed the document. On page 271 it is stated that "Mr. Parton and Mr. Bigelow alone have reprinted Polly Baker's speech." It is worthy of remark that it was reprinted in *Hall's Law Journal* in 1813; in connection with which fact, two interesting notes are to be seen in the *Nation* for November 7 and December 26, 1878 (vol. 27, pp. 285, 398), in the first of which is given a summary of the famous speech.

Professor McMaster calls for a better edition of selections from Franklin's best literary productions. No one could do this more skilfully than himself. It might make Franklin's writings better known than in fact they are. Even the immortal Autobiography is in danger of being more talked about than read. Mr. Bigelow has, it is a pleasure to see, put Franklin's conjectural contributions to the *Pennsylvania Gazette* into his latest edition; it now remains for some one to reprint the "Dogood" papers, Franklin's earliest efforts, to which Mr. Parton first called attention, and quotations from which Professor McMaster freely cites, having apparently no doubt as to the author. Mr. Bigelow thus far ignores these early attempts, although he prints Franklin's "Skeleton sketch of the topics for the Autobiography," in which he admits the authorship of them.

STEWART AND GEE'S PHYSICS.

Lessons in Elementary Practical Physics. By Balfour Stewart, M.A., etc., and W. W. Haldane Gee. Vol. I. General Physical Processes. 8vo, pp. xvi, 291. Vol. II. Electricity and Magnetism. 8vo, pp. xx, 497. Macmillan & Co. 1885, 1887.

In 1870 the late Prof. Stewart published an elementary treatise on physics (3d ed., 1886) to which he gave the title 'Lessons in Elementary Physics.' We cannot regard the title as well chosen. It is true the chapters were divided into "lessons," presumably to render the work more convenient for use as a text-book; but this fact did not render the word a fitting one to go upon the title-page. In that position, so far as it conveyed any impression at all, it was one which was misleading, and calculated to hide the real merits of the work. When we take up a book entitled 'Lessons' in any science, we can hardly avoid the impression that it is somewhat fragmentary and disconnected; that it treats of special points which the author considered interesting or important, but that it does not pretend to be a systematic text-book or treatise on the subject to which it relates. But Prof. Stewart's book was by no means one of this kind. It began at the beginning, covered the whole ground, and, so far as regards fundamental principles, was a well-digested, well-developed, and very complete work. It was, in fact, an elementary treatise on physics, designed for use as a text-book in schools and for private study, and this, or something equivalent to this, should have been its title.

The work before us is of an entirely different character. When completed by the publication of the third volume on 'Heat, Light, and Sound,' supposing that volume to be constructed on the same plan as those which have already appeared, and considering the size of the volumes, it will be at least four times as large as the elementary work to which we have referred. Its title differs from the title of that work only by the insertion of the word "practical." But the work is not practical as opposed to theoretical. A large portion of the experiments are inserted for the sole reason that they serve to illustrate physical theories and are the foundations on which those theories are based. Neither is the work practical in the sense that its main object is to teach the application of physics to the business affairs of life. Of course very much is contained in the volume on electricity and magnetism the knowledge of which is of the greatest utility, even indispensable, to the electrical engineer, to the manufacturers of electrical machines, to the managers of telegraphs and telephones, and various others; but the object of the book is not to teach these gentlemen their business. The telegraph and the telephone are treated not as a means—at which we have not yet ceased to wonder—of communication between widely separated persons, but as the means nearest at hand to illustrate and explain some of the most important phenomena of that mysterious agent which promises so much and of which we still know so little. The work is, in fact, a treatise on experimental physics, and is practical in the sense of giving minute directions for the actual performance of those experiments upon which the science is based.

In what sense it is called an elementary work it would be hard to say. It is true that it gives detailed directions for the performance of the simpler as well as the more complicated experiments—for those that require only such simple apparatus as most students can prepare for themselves, as well as those which require the intervention of complicated and costly machines. But no one should be misled by the use of the word elementary on the title-page into the supposition that the work is suited for beginners. A large portion of the work would be of little or no use to those who had not previously studied some elementary treatise on physics, and for this preparatory study the elementary treatise first mentioned will on the whole be found the best, especially because it was written by the best-known author of the present work. But, whatever introductory treatise may be used, we can safely say of the students in high schools and colleges, that the more they already know of the science of physics, and the more ample the means of performing experiments to which they have access, the more useful they will find this work.

A considerable knowledge of the science, or rather sciences, of physics, is not the only qualification which the authors of this work assume that the student possesses. The number of mathematical formulæ is very great. This was unavoidable. The mathematical method is the only clear and satisfactory method in which a large part of the science can be treated. The authors seem to have made special efforts to render everything as clear and simple as possible; but if any one will look at "Lesson xix. General Theory of the Balance" (vol. i, p. 63), or "Chapter v. The Tangent Galvanometer" (vol. ii, pp. 225–274), he will see that they will be of very little use to him unless he is "well up" in his algebra, geometry, and trigonometry, and that in the former an acquaintance with the principles of the lever is also necessary. The processes of the differential and integral calculus are sometimes introduced, for example, in the chapter on Elasticity (vol. i, ch. vi), but not to such an extent as to render an ignorance of that branch of mathematics a serious impediment to the use of the work.

The chapters into which the work is divided commence usually with a short general introduction, giving such definitions and explanations as are necessary to the understanding of the lessons which follow. This general introduction is, however, sometimes omitted, and, as in the first chapter of the volume on Electricity and Magnetism, we are immediately set to work. The lessons are constructed throughout on one invariable and consistent plan; the metrical system, in the form known as the C. G. S. (Centimètre, Gramme, Second) system of measurements being, in almost all places employed, though ample tables and directions for converting the metrical into English measures are given. The opening lesson of vol. ii, which plunges at once *in medias res*, will serve as a specimen of all. It is entitled "Electrification by Friction and Conduction." First we have a minute statement, under eleven distinct heads, of the necessary "Apparatus." In order to show the minuteness and detailed accuracy and clearness with which this statement is made out, we will quote some of the divisions; we have not room for the whole:

"(1.) Two pieces of glass tubing about 350 mm. long by 15 mm. in diameter. Each must be closed at one end by the blow-pipe. The tubes must be thoroughly clean and dry. The open end should be closed by a cork to keep out dust. (2.) Several ebonite penholders. . . . (6.) A piece of catskin or other fur. . . . (11.) Several mètres of silk thread."

Then follows: "Experiment I. Electrification by Friction." And first we have a clear and precise statement of what the experimenter must do, and lastly a statement of the results, the inferences to which they necessarily lead, and the principles they appear to establish. Next comes "Experiment II. Electrification by Conduction," on the same general plan. This experiment is followed by a table containing "a list of substances in their approximate order of conductivity." Finally, we have: "Experiment III. All substances of a different nature may be electrified by being rubbed together." With a model example of the course to be pursued in order to establish this principle, the lesson ends. Two engravings of parts of the apparatus employed in these experiments are inserted in the text. The whole work is abundantly supplied with engravings made from drawings or photographs taken directly from the apparatus itself.

In the preface to the first volume the authors express the hope that their work may prove of use to three classes of students: "in the first place, those who are attending an elementary course in a well-furnished laboratory; secondly, those who have access to a laboratory containing only a few instruments; and thirdly, those who are desirous of acquiring a knowledge of the processes of physics while they have not the opportunity of working in any laboratory. This last class will value the engravings we have given." To the first class of students this work will be simply invaluable. By keeping it near at hand when working in the laboratory, they will save a vast amount of time and trouble to themselves in asking, to their teachers in answering, a multitude of questions. To the second class, so far as the apparatus to which they have access extends, the same remarks will apply as to the first; so far as they are obliged to do without apparatus they belong to the third class. The third class, who depend upon books alone, will, for the most part, be made up of those who have previously studied some elementary text-book of

natural philosophy, and whose tastes lead them to desire a more extended acquaintance with the subject. Such persons will find in these volumes an elaborate description, accompanied with engravings, of the construction and manipulation of almost every instrument and machine that is found in the best furnished physical laboratories. By far the larger portion of the experiments will be perfectly intelligible to such readers. Precautions to be observed by the operator in order to avoid injury to himself or his instruments, and to secure a successful result to his experiments, directions for the care and preservation of apparatus when not in use, and other practical details, are given in their proper places throughout the work. We take it for granted that the concluding volume will contain an index to the whole work, though we cannot affirm that such an assumption is based upon the usual practice of the authors and publishers of English text-books.

We regret to say that since the above review was prepared, we have been obliged to insert the word "late" before the name of Prof. Stewart in its opening sentence; he died suddenly on the 21st of December last in the sixty-first year of his age. We are, however, glad to notice that the third and concluding volume of the joint work was left "in an advanced state of preparation," and its plan had been so clearly marked out in the two volumes already published that we do not doubt his collaborator, Mr. Gee, will be able to give it to the world in substantially the form it would have had had Prof. Stewart lived to see it through the press.

The Principles of the Art of Conversation. By J. P. Mahaffy. G. P. Putnam's Sons. 1888.

Mr. Mahaffy likens conversation to rhetoric and logic, and attempts to state its principles, as if these were capable of being taught; and he really succeeds in making a little formal disquisition so ingeniously systematic as to impose on one for an analytical and expository treatise. But, as a matter of fact, he has written a much more engaging thing than a scientific inquiry into the first principles of a new art; he is interested in improving the natural social gifts of men and women, in getting them to talk together with more pleasure to one another, and in warning them of the shoals and reefs on which conversation is commonly wrecked in small and large companies. His suggestions are general, but instructive; his observations are entertaining, and this, if he is to be taken literally, is of much more importance. He adopts, without reservation, the view that social gatherings are for amusement; the chief end of man in company is to please, and the other purposes of his being, if he has any, must be swallowed up in this or be laid aside for the nonce. Conversation, under this rule, is a department of manners, and lives by the vigor of the one great social virtue, which is to please at all costs. If the lion tyrannizes, or the old raconteur drags, or the youth is aggressive, then failure begins to set in; the subject may be all important, the specialist still be instructive, and novel facts and apposite illustrations still be elicited, but if the company tires, socially speaking, there is an end of everything.

In the author's anxiety to protect us from being bored, he pushes his zeal for the cause of mere entertainment to all lengths. He has a few paragraphs on "stupid truthfulness" even, and shields himself behind Aristotle in declaring that a too great regard for veracity spoils conversation. He quotes with approval the wit who pronounced it the golden rule of talk "to know nothing accurately," and at last rises to the height of the occasion with the remark that "to ask, Is that really true? or to exclaim, Really, that is too much to expect us to believe! shows that the objector is a blockhead unfit for any amusing conversation." But not to commit those two unpardonable errors of dwelling too long upon a topic, or of taking an extreme statement too seriously, surely, although to please be one great end of conversation, as it is of life generally, nothing will be lost by taking care in regard to the means by which we please when that is a conscious aim. The man who is heightening and coloring what is on its face a description of facts, merely to make himself more amusing, is a poor spectacle, and no one respects him at the time when he is known to be playing the trick. The matter of openly doubting the veracity of any one who is speaking is another question, involving a different sort of propriety; but the practice of mixing truth and fiction according to the taste of the company is a most insidious habit, and opens the way to all kinds of that injustice to persons which ranges from humorous gossip to hateful scandal. Truth is a good enough friend to be borne with, even when "stupid."

Is it so very clear, after all, that to please is the chief end of social man? In a general way, of course, every one consents to the dictum as a truism; but Mr. Mahaffy is in search of a philosophy of the matter, and has, besides, a knack for ulterior analysis, and more exact ideas may be fairly required of him. He seems to us to save himself after the fashion of most stoics who divert themselves at odd moments with playing at being epicureans: he has a standard of pleasures, and into these a moral element enters with controlling force. The society which he has ideally in view is cultivated, intelligent, curious, alert, and as pure as could be expected; the subjects which interest it must have value of some sort in order to get discussed at all. The qualities which distinguish this society are enumerated as modesty, simplicity, unselfishness, sympathy, and tact; the shy man and the blunt man are ruled out as impracticable, and he who is silent because of his timid vanity is excommunicated without grace. Women especially are given an independent and respected position, gallantry towards them in the old style is declared to be vulgar now, and it is insisted on as a prime point that they should meet and be met with on the same mental plane as men. In short, here are the tastes, culture, knowledge, and manners of a high civilization, and to please such a society might well be made an aim of our conversation and of our life also, if we were only sure that society is practically such. Here and there in this text, however, are enough indications of the weaknesses of these cultivated groups; it is plain that one would find himself talking gossip and scandal, and permitting whatever has lost its grossness in the alembic of witty words, if he consents to take for his sole rule and guide the knowledge of what will most please. And what shall be said of a "principle" that cannot be applied to all places in which the "art" in question is practised? Where lower tastes prevail and coarser pleasures are most relished, the talk, governed by this criterion of "what pleases" merely, may be mean, cruel, or foul, or whatever of wickedness that unruly member, the tongue, can compass. "To please" is the end of every fine art, but much deeper probing is required to disclose their nature; and so it is with conversation.

Independently of these general questions, which must be touched on of necessity in a volume of first principles, Mr. Mahaffy's dissertation is a very practical and useful one. His treatment is light, but thorough, and he pursues his subject with unflagging spirit through all its compass. Host and guests may equally learn from him. The modifications of attitude and approach consequent on differences of years, station, or education, the availability of general and special knowledge, books, reminiscences, and *la chronique scandaleuse*, as topics, and all such matters, are examined with critical discrimination. Suggestions are cleverly and frankly made. The author fairly wins a hearing for himself. Yet, after all this laborious inquiry into the proper conversational behavior of a mature man or woman to a monarch or a tradesman, a cricketer or a débutante, a Nestor of the old régime or the last arrival from Bechuanaland, one feels that the discussion has gone on in a make-believe place, because of the variety of human character which limits the theorizing. The art, like that of politics, is in its practice too specific for any but the vaguest rules. It comes to little else than this, at the end of Mr. Mahaffy's interesting lecture, that an amiable man will endeavor to discover what freemasonry there is between himself and his chance acquaintance wherein they can meet equally, and will then engage the other's mind with what is welcome to it, and in his own turn will be willing to accept the same treatment, and all the while he will maintain the character habitual to him. The style in which he will do this depends on temperament, early training, and national usages rather than on book instruction; in this case, preëminently, the style is the man. But if Mr. Mahaffy leads his readers to expend a leisure hour of reflection on the use of the tongue, which is a subject not too much thought about, his somewhat worldly sermon will have gone to its work.

Story of the Old Willard House, of Deerfield, Mass. By Catharine B. Yale. Boston: Houghton, Mifflin & Co. 4to. 1887.

One must read between the lines to gather from this paper, read a year ago before the Pocumtuck Valley Memorial Association, that Mrs. Yale is describing her present home. The old house has repaid the conscientious workmanship bespoken for it by its builder, resisting the assaults of time, remaining both habitable and attractive, and connecting itself in its continuous occupation with many notable New England families and events. The northeast wing antedates the Indian burning of the town in 1704, the then owner's wife and six children being carried off captive: "one child was killed, the rest were taken to Canada, one came back, two were known to have married Indians." The second owner's son, born in the house, was the father of Ethan Allen. The Manse was built by Joseph Barnard in 1768, after thirteen years had been spent in selecting the timber, and the head carpenter was probably the great-grandfather of Mr. D. R. Locke, better known as the cross-roads humorist, "Petroleum V. Nasby." Joseph's son, Samuel Barnard, graduated from Harvard in 1762, and was sent up to the General Court in 1773 by a town meeting which listened to a paper on the wickedness of the slave-trade — one of the forthcoming counts against George the Third in Thomas Jefferson's rough draft of the Declaration. He married Abigail Upham, doubtless of the Salem family, and their three oldest daughters were married on one day at the Manse in 1792. Two years later the house was sold to a great-grandson of the Rev. John Williams, the famous "Redeemed Captive" of Indian story. The purchaser was another Harvard graduate, and in 1807 leased the house to Hosea Hildreth, preceptor of the old Deerfield

Academy; and during his occupancy a third and yet more distinguished Harvard graduate was born to him there—Richard Hildreth, the historian of the United States. Mrs. Hildreth was the aunt of the late George Fuller, the artist, called by Mrs. Yale "Deerfield's most illustrious citizen." In 1811 the Manse passed into the hands of the Rev. Samuel Willard, who lived in it till 1859, with an interval of seven years. He was a nephew of Joseph Willard, President of Harvard, and graduated himself at that college in 1803. The conflict over his ordination in Deerfield "was really the beginning of the 'Unitarian movement in Western Massachusetts,' as this theological departure was called." Of this estimable man and his family Mrs. Yale is able to make a substantial presentation. Among their guests were the great lights of the denomination, radical and conservative—Channing, who was often there, Henry Ware, father and son, John Pierpont, Francis Parkman, father of the historian, Emerson—along with our friends the Lymans of Northampton. For the period following 1859 Mrs. Yale gives no precise dates. A temporary resident, at a time when the house seems to have been let to more than one family, was Jonathan A. Saxton, from Harvard again, a contributor to the *Dial*, and father of Gen. Saxton, military governor of Beaufort, S. C., in 1864—in contrast to another inmate, the Rev. Rodolphus Dickinson (Yale, 1805), who had been a pastor of John C. Calhoun at Greenville, S. C.

Mrs. Yale's well-written narrative is pleasantly tinged with sentiment and antiquarianism, and is illustrated by pen drawings of the Manse and its members. The typography is open and elegant, and the thin volume has an appropriate shape for the parlor table. Still, a better conception of the mode of publication would, in our view, have been a smaller volume, of a shape fit for the shelf, if not even for the pocket, with etchings or photogravures in place of the present designs.

La Noble Leçon. Texte original d'après le MS. de Cambridge, avec les variantes des MSS. de Genève et de Dublin. Publié par Édouard Montet. 4to. Paris. 1888.

Professor Montet of the University of Geneva has already earned the gratitude of all students of the religious development of Europe by his 'Histoire littéraire des Vaudois du Piémont,' in which he gave a careful analysis of the existing remains of Waldensian literature as preserved in the MSS. of Cambridge, Dublin, Geneva, Strassburg, and other libraries. That work was the most important contribution as yet made to the accurate knowledge of the gradual evolution of the Waldensian beliefs, and served to dispel many errors which had been commonly entertained on the subject. He has now placed scholars under renewed obligations by a critical edition of the most notable of Waldensian writings, founded on the oldest and best existing MS., with the variants of the others. This he accompanies with a current French translation, and with two versions executed by MM. Chabrand and Vilielm, in the modern patois of the valley of Quévas and the Val San Martino. These afford a valuable opportunity for philological comparison, and one can only hope that on some future occasion M. Montet may be induced to print the extended investigation of the various Waldensian dialects, and their variations from the earliest times, which he had prepared to accompany the present work.

The 'Noble Leçon' has been deservedly the object of much interest. In a poem of less than five hundred lines it embodies an abstract of God's dealings with man as revealed in Scripture, and presents the belief and moral teachings which were deemed essential by the Christians of the Waldensian valleys. Its noble simplicity and earnestness reflect the purity of faith and morals to which the persecuted saints so often sealed their devotion with their blood, and there are few remains of the Middle Ages which give to the inquirer a clearer insight into the thoughts and aspirations of the period. What that period was has been the subject of prolonged controversy. The one weakness of the Waldenses was the belief that their sect dated back to the times of Pope Silvester I., and that they could trace an unbroken descent from the purity of the primitive Church. There was thus a temptation to antedate all their monuments, and show that they had a well-defined faith before Peter Waldo, about 1170, commenced his missionary work. One MS. of the 'Noble Leçon' reads, in the seventh line, "Ben ha mil e cent ans cumpli entieràment," which was held to show that the poem was composed about the year 1100 A. D. Modern researches, however, have brought to light older MSS., in which the line reads "Ben ha mil e cccc. ans," and the best codex of all bears an erasure before the word "cent," in which the figure "4" had evidently existed originally, thus settling the date of production as in the neighborhood of the commencement of the fifteenth century—a conclusion harmonizing with the internal evidence of the poem and now generally accepted by scholars. M. Montet gives photographs of the passage in the four existing MSS., and his arguments to prove the correctness of this view will be generally received as final.

In an appendix he prints an abstract of a lately discovered Waldensian MS. now in the public library of Dijon, containing a number of tracts of much interest. The whole work is one which will be warmly welcomed by scholars as in every way worthy of his distinguished reputation.

Elizabeth Gilbert and her Work for the Blind. By Frances Martin, author of 'Angélique Arnauld,' etc., etc. Macmillan & Co.

This is another variation of a common theme—the development of faculty through limitation. Elizabeth Gilbert was born at Oxford, where her father was Principal of Brasenose College, in 1826. In her third year an attack of scarlet fever destroyed her sight, and bequeathed to her a general inheritance of ruined health. Throughout her childhood and her youth she was not unhappy, her misfortune attracting to her a great deal of sympathy and attention. It was when she came to the threshold of womanhood that the difference between her life and that of her several sisters came home to her with agonizing force. Then, in a happy hour, after a period of intense depression, threatening to shake her reason from its seat, she fell under the influence of Miss Bathurst, "one of the little band of so-called 'advanced' women who, about this time, 1850, were interested in every movement having for its object the development and intellectual culture of women, and the throwing open to them of some career other than matrimony," since that was evidently not possible or even desirable for all. Miss Bathurst's high enthusiasm was contagious, and communicated itself to her young relative and friend. Summoning to her aid an assistant teacher in the St. John's Wood School for the Blind, Miss Gilbert set up in a cellar in New Turnstile, Holborn, a shop for the sale of baskets made by blind persons, eight of whom had part in the original enterprise—one at the bleaching bin in the cellar, who in 1887 was still in the employ of the institution which engaged his services in 1854. Miss Gilbert had learned that it was not sufficient to give the blind a little education and a little skill in handicraft, and then turn them off upon the tender mercies of mankind. The most of them soon came to beggary when treated so. They must have shops of their own and special agencies for selling their goods. The cellar in Holborn was soon outgrown. An association was formed for carrying on the work. A letter from Miss Gilbert to the Queen brought £50, and set a good example. Miss Gilbert's father was now Bishop of Chichester, and had many influential friends, of whom Miss Gilbert availed herself with much discretion. So the good work went on. "Don't work yourself to death," a friend said to her one day. "I'm working myself to life," she answered with a laugh.

In 1866 the balance sheet of the association showed receipts amounting to £7,632. There were other signs of encouragement. The success of the London enterprise raised up a steadily increasing number of similar associations in Great Britain, and a report of the Pennsylvania Institution for the Instruction of the Blind brought to Miss Gilbert the assurance that her name was known and honored, and that her work was bearing fruit, on this side of the Atlantic. Before her death there were large and well-appointed workshops in almost every city of England, where blind men and women were employed, where tools had been invented or modified for them, and where agencies had been established for the sale of their work. Each success opened out into some new beginning, and she had just set her heart upon a scheme for the better education of the blind children of the poor, which no doubt her energy would have pushed to some successful issue, when her health, always miserable, showed signs of a complete collapse. Her years of painful invalidism were cheered by constant interest in a work so well established that it could go on without her guiding hand, and by the gratitude of many to whom she had been a priceless friend.

Miss Martin's book can hardly be considered an effective presentation of Miss Gilbert's life and work. It is much too long, and contains a good deal of matter that is not relevant and rather mars than helps the one impression it was most desirable to make. But in and between the lines we read the story of a life saved from misery and despair by its consecration to the welfare of other lives equally marred and less protected than Miss Gilbert's own. It will be strange if such a story does not rebuke the selfishness of some who are in full possession of their health, their senses, and their intellectual powers.

Ancient Nahuatl Poetry: Containing the Nahuatl text of xxvii ancient Mexican poems, with a translation, introduction, notes, and vocabulary. By David G. Brinton, M. D., Professor of American Linguistics and Archæology in the University of Pennsylvania. Philadelphia: D. G. Brinton. 1887.

This is the seventh volume of Brinton's "Library of Aboriginal American Literature." By publishing the Nahuatl text of these songs, Dr. Brinton has rendered a lasting service to American ethnology and linguistics. Similar native improvisations are found among many tribes, and even among such as stand on a much lower level of apparent culture than

did the Nahuatl-speaking Indians of Mexico, and it is to be hoped that students living among the Indians themselves will strive to follow the example set by Dr. Brinton in giving to the scientific world the original versions as far as possible. We may then also hope for an appreciation of native poetry according to its true value, for there is a wide difference between interpretations of it on the one hand from manuscripts, and on the other by one who has heard it from the natives themselves, and to whom they explained it according to their own conceptions and manner of thought. The Nahuatl Indian still improvises to-day in his native language. He will, also, while playing the guitar or the psalterio, fit in, so to say, "couplets" on the spur of the moment.

Although some doubts arise as to the antiquity of certain of the twenty-seven songs given by Dr. Brinton, there cannot be the slightest doubt as to their being *genuine Indian productions*, those attributed to Nezahualcoyotl perhaps excepted. In regard to these, objections occur which it is not the place here to consider. In this last volume, as well as in all of Dr. Brinton's previous works, it is much to be regretted that the learned author has not had an opportunity as yet of becoming intimately acquainted with the true nature of the American native through long personal contact. Such an amount of practical knowledge would greatly enhance the value of his meritorious efforts.

BOOKS OF THE WEEK.

Adventures of Baron Munchausen. Illustrated. G. P. Putnam's Sons. $1.75.

"This is a faithful rendering of the 'De Beneficiis' in plain but academic English."—*St James's Gazette.*

RANKE'S HISTORY OF THE LATIN AND TEUTONIC NATIONS. Translated by P. A. Ashworth. $1.40.

HEINE'S TRAVEL-PICTURES. Translated by Francis Storr. $1.40.

"Mr. Storr's brilliant version."—*Academy.*

GOETHE'S CORRESPONDENCE WITH ZELTER. Selected, Translated, and Edited by A. D. Coleridge, M. A. $1.40.

THE STUDENT'S HANDBOOK OF HISTORICAL GEOLOGY. By A. J. Jukes-Browne, B.A., F.G.S. $2.40.

PAUSANIAS'S DESCRIPTION OF GREECE. Translated by A. R. Shilleto, M. A. 2 vols. $4.

HOFFMANN'S TALES. The Serapion Brethren. First Portion. Translated by Lieut.-Col. A. Ewing. $1.40.

HAUFF'S TALES. The Caravan—The Sheik of Alexandria—The Inn in the Spessart. Translated by S. Mendel. $1.40.

GOLDSMITH'S WORKS. A New Edition. By J. W. M. Gibbs. 5 vols. $7.

A SELECTION.

ANTONINUS.—THE THOUGHTS OF M. AURELIUS. $1.40.
ADDISON'S WORKS. 6 vols. $8.
BAX'S MANUAL OF THE HISTORY OF PHILOSOPHY. $2.
BOSWELL'S LIFE OF JOHNSON (Centenary Edition, edited by Napier). 6 vols. $8.40.
COLERIDGE'S WORKS. 6 vols. $8.40.
FAIRHOLT'S COSTUME IN ENGLAND (Dillon.) 2 vols. $4.
LESSING'S LAOKOON. Translated.
LESSING'S DRAMATIC WORKS. 2 vols. Translated.
MILTON'S PROSE WORKS. 5 vols.
MOLIERE'S DRAMATIC WORKS. 3 vols. Transl. $4.20.
PEPYS'S DIARY. 4 vols. $8.
PLUTARCH'S LIVES. 4 vols. (Stewart & Long's trans.) $5.60.
SPINOZA'S CHIEF WORKS. Translated. 2 vols. $4.
STAUNTON'S CHESS HANDBOOK. $2.

*** The above books sent upon receipt of advertised price. Catalogues of our regular stock will be mailed, if desired, to those interested. New Catalogue of Choice and Rare Books nearly ready.*

SCRIBNER & WELFORD, 743-745 BROADWAY, N. Y.

Scribner's Magazine

FOR FEBRUARY,

Contains the second of Mr. Robert Louis Stevenson's series of charming monthly papers. The New York *Tribune* says in referring to them:

"The matter is of itself enough to interest every person in the least interested in literature, and the manner of it is such as to make us ask again of him for the hundredth time, as it was asked of Macaulay, 'Where did he get that style?'"

In his present article, entitled "The Lantern Bearers," Mr. Stevenson refers to picturesque memories of his boyhood.

FELIX MENDELSSOHN - BARTHOLDY. Frontispiece.
Engraved by G. Kruell.

MENDELSSOHN'S LETTERS TO MOSCHELES—From the manuscripts in the possession of Felix Moscheles—I. William F. Apthorp.
With portraits and reproductions of drawings by Mendelssohn. A most interesting collection of unpublished material.

FIRST HARVESTS—(Second Installment.) F. J. Stimson.
Taking the serial into New England, where an idyllic love story is unfolded.

THE MAN AT ARMS. E. H. Blashfield and E. W. Blashfield.
Illustrated by E. H. Blashfield.

NATURAL SELECTION—A Romance of Chelsea Village and East Hampton Town. *In Three Parts. Part II.* R. C. Bunner.
With illustrations by Carl Hirschberg.

VOLCANOES. N. S. Shaler.
With illustrations by J. D. Woodward, Julian Rix, O. H. Bacher, Frank Day, and C. S. Robinson.

THE LAST OF THE GHOSTS—(Story.) Barrett Wendell.
With illustrations by M. J. Burns, W. P. Bodfish, and others.

WHAT THE WILL EFFECTS. William James.

THE LAW AND THE BALLOT. Joseph B. Bishop.

POEMS by H. C. Wright, Maybury Fleming, Mrs. James T. Fields, and A. H. Allen.

"In its one year of life, SCRIBNER'S MAGAZINE has taken not only an exalted and permanent place in periodical literature, but one that the world could in no sense spare. With the January number it enters auspiciously on its second year."—*Boston Traveller.*

Price, 25 cents a number; $3.00 a year.

SPECIAL NOTICE.—To enable readers to possess the Magazine from the first number (January, 1887), the following inducements are offered:

A year's subscription for 1888 and the numbers for 1887.....$4 50
A year's subscription for 1888 and the numbers for 1887, bound in two volumes, cloth, gilt top..... 6 00

CHARLES SCRIBNER'S SONS,

NEW YORK.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 9, 1888.

The Week.

THE revision of the civil-service rules is generally recognized as marking another step forward in the march of reform. The only intelligent criticism which we find anywhere is that which is directed against the refusal by the President to endorse the rule recommended by two of the three Commissioners, that the appointing officer should be required to file a written statement of the cause of dismissal in every case. We are aware that not a few civil-service reformers have always favored a regulation of this sort, and there is something to be said in its favor, but the arguments on the other side appear to us much the stronger. It constantly happens in private business that an employer thinks it wise to discharge a man because he is not entirely satisfied with the manner in which he does his work, although it would often seem too harsh to charge the delinquent publicly with neglect of duty. The same thing is always liable to happen in a public office. The civil service cannot be conducted efficiently if there must be a public trial every time that the head of an office thinks it wise to dismiss a subordinate. The competitive system renders it impossible to smuggle a man into a vacancy, and thus removes the only really dangerous motive for making a vacancy. With admission to the service thus guarded, the length of retention may be left safely to the discretion of the appointing power.

Senator Kenna of West Virginia, in his speech on the tariff question last Thursday, opened a volume entitled 'Speeches and Reports on Finance and Taxation, by John Sherman, edited by himself,' and read a number of curious passages. In one of these the Ohio Senator said that it was absurd to use such general phrases as a protective tariff, a revenue tariff, a free-trade tariff, without defining them and telling what we mean by them, since any duties on imported goods were more or less in restraint of trade. "The expression a free-trade tariff involves an absurdity," he said. This being quite in harmony with President Cleveland's saying that "it is a condition, not a theory, that confronts us," and that "our progress towards a wise conclusion will not be improved by dwelling upon the theories of protection and free trade," we might infer that the President wrote his message immediately after a gratified perusal of Senator Sherman's speeches. Mr. Kenna, continuing his extracts from the volume, read another showing that it is "an absurdity to talk about a free-trade tariff and to talk about a protective tariff, because the wit of man could not possibly frame a tariff that would produce $140,000,000 gold without *amply* protecting American industry." The present tariff, Mr. Kenna said, was yielding $212,000,000. But no man could possibly cut it down to $140,000,000 without "amply" protecting American industry! But this was not all, nor the worst. Another paragraph from the book said:

> "If you reduce their productions [the manufacturers'] to a specie basis and put them on the same footing they were on before the war, *the present rates of duty would be too high.*"

The same or higher rates of duty are now existing that were in force when Mr. Sherman uttered this true saying, and, since specie payments have been long since restored, it follows that the present rates are too high and that President Cleveland is quite right.

Up to this point Mr. Kenna had done very well in exposing the shams of Mr. Sherman's recent speech on the tariff, but in an unguarded moment he dipped into another part of the Ohio Senator's record, showing how, at one time, the Senator advocated and actually carried through Congress a bill to promote the introduction of "contract labor" into this country. Mr. Sherman replied that he had no recollection of the bill or the speech. Mr. Kenna offered to show both to him. Mr. Sherman declined to look at them, but said he would look them up for himself. Mr. Kenna obligingly gave him the date, July, 1864. That furnished just the text that Mr. Sherman wanted. It was in the midst of the war that the bill to encourage contract labor was introduced. With 2,000,000 of our workingmen under arms down South, how could we get along without foreign labor? At that time he would have passed any law or done anything "to beat the Democratic party, because the success of that party was the dissolution of the Union." Having got on the war issue, Mr. Sherman began to grow strong, and after exciting the galleries with a pleasing picture of our brave Union soldiers cutting down the hosts of treason and rebellion in front, while foreign laborers were cutting down wheat, and corn, and oats in the rear, he manœuvred up to the tariff question in a broad way, avoiding any allusion to the sayings quoted by Mr. Kenna, and closed with general applause. Mr. Kenna's effort was a fresh illustration of the maxim that when you have fully made out your case, you had best stop.

The *Railroad Gazette* of Friday mentions the placing of an order for 30,000 tons of steel rails by the Pennsylvania Railway Company at $31.50 per ton, the order being divided between the Pennsylvania Steel Company, the Cambria Iron Company, and the Edgar Thompson Steel Works. So large an order as this necessarily establishes a price for a short time. There is reason to believe that the Committee of Ways and Means have fixed upon $11 per ton as the duty on steel rails in the new tariff bill, the present duty being $17. The latest London *Economist* received here quotes steel rails at £4 2s. 6d. to £4 5s. at Middlesborough. That is, the English price is about $20.50 per ton on the furnace bank. Add this price to the proposed duty of $11 per ton, and we have exactly the price at which the American steel-rail producers are voluntarily selling, no account being made of the freight from Middlesborough to Liverpool, from Liverpool to New York, and from New York to inland points. We trust that this coincidence between the price considered satisfactory by the steel-rail combination and the price at which rails could be got from abroad under a $11 duty if they could be transported by witchcraft, will save us from any great amount of wailing on this subject when the Tariff Bill comes up for debate, and spare all hands the necessity of showing that American labor is not ruined.

The customary plea against a repeal of the coal duty is that it would not do any good, because there is no foreign coal that could come in competition with American coal anyway. A morning contemporary publishes an interview with Mr. E. L. Morris, the agent of the West Virginia and Pittsburgh Railway Co., which owns and operates some bituminous mines on the other side of the Alleghanies. Mr. Morris says that in his opinion the repeal of the duty "would have no effect whatever." His reasons are, that "the Nova Scotia coal is of such inferior quality that a limited quantity would be used if it could be obtained without duty and without price; besides, some of the insurance companies (if not all of them) have refused to take risks on factories where this coal is now used in small quantities (in some parts of New England), and what is used is 'culm,' upon which the duty is only 30 cents a ton; the reason of this refusal is, the coal is liable to ignite by spontaneous combustion." Being asked how much of this Nova Scotia coal could be used in this country if there were no duties on it, he answered: "I do not think that an appreciable amount could be placed in the markets here, as it is not a suitable fuel for the manufacturers of this country." The conclusion would seem to be necessary and inevitable that the duty on coal is maintained *because it is of no use.* All the lobbying and wind work at Washington in favor of the coal tariff is kept up because there would be no coal imported even if it were admitted free. The duty was raised from 50 cents per ton to 75 cents a few years ago because no duty at all was necessary. We trust that Congressmen will not go crazy trying to understand this argument. We think that very little coal would be imported if the duty were repealed; but that little would be a help to New England manufacturers and smelters whose works are conveniently situated near the seacoast, and to whom a very little cheapening of fuel might be the difference between life and death to their industries. We agree with Mr. Morris that American coal-producers would suffer nothing.

What the outcome may be of the demand of the coal-miners in the Wyoming and Lackawanna districts for an advance of 15

per cent. in wages, it is very difficult to forecast. Probably the chief officers of the companies themselves do not know. It has been plain for some time that without a strike in these districts the Lehigh and Schuylkill strikers must fail. If Wyoming and Lackawanna could supply all the coal wanted by the public, it was simply a question of endurance in the other districts between the companies and the men, and of course the men must eventually yield, or see their places gradually filled by others who are willing to work for the wages offered. Rioting and Molly Maguireism may continue for a season, but the power of the law must overcome all resistance in the end, and it must be remembered, too, that Pennsylvania has a gallows in reserve for murderers. The demand of the Wyoming miners involves very weighty considerations. Can the country afford to pay 15 per cent. more for its fuel? Can anthracite coal compete with bituminous at such an advance, or at any advance, in those places where they come in competition with each other? Can the anthracite companies themselves compete with each other at an advanced price when it has been shown experimentally that one-half of them are able to supply the public demand for coal in the depth of winter, while the other half are idle? Upon the answers to these questions must depend the answers which the companies give to the demand for an advance. The questions are too complicated and far-reaching to be answered dogmatically. The only thing quite certain is that the law must be upheld at any cost. Whatever suffering may result, the right of laboring men to accept wages satisfactory to them and the right of the companies to hire men who are willing to work, must be maintained. It was maintained in the last great strike, and it will be so again. Perhaps the State of Pennsylvania will come to a decision upon this point all the sooner under the influence of a coal famine.

A pretty vigorous protest is coming up from the South against the "Adulterated Lard" Bill. The Mississippi Legislature has passed resolutions against it, and the Merchants' and Cotton Exchanges of New Orleans have sent protests against it to Congress. The New Orleans *Times-Democrat* calls it a bill "to reduce the value of cotton seed 50 per cent." It is very evident that the bill will not pass without a fight. Indeed, it is doubtful if it passes at all. If Congress is to undertake the regulation of all mixtures of food products, without reference to their character, deleterious or otherwise, it will not be able to abolish the internal-revenue system very soon. It is not pretended that mixing cotton-seed oil with lard injures the lard in any degree, but that it merely takes the place of a certain amount of lard in the market, and thus lowers the price just as oleomargarine lowered the price of butter. The bill is therefore a protective measure, and must be carried through on protective principles. We cannot see any difference between this bill and one which should seek to put a clog on new inventions. The discovery that butter can be made from the fat of a slaughtered ox as easily as from the cream of a living cow was a great boon to mankind, and one which cannot be suppressed, although it may be temporarily crippled by legislation. The discovery that the sun's light and heat work the same result in the production of edible fats in the seed of the cotton plant as in the fruit of the olive or in the bodies of swine is akin to it, and is likewise a benefit to the human race. Why should Congress undertake to prevent the diffusion of this blessing? If the proposed bill does not prevent it, the measure will be useless to those who now clamor for it.

Another "State-rights" decision has been rendered by the Republican Justices of the United States Supreme Court. The Alabama Legislature last year passed a law requiring locomotive engineers to have licenses. An engineer employed by the Mobile and Ohio Railroad Company, whose line extends beyond the State, neglected to get a license, and, upon being arrested for his neglect, sued out a writ of habeas corpus and got his case carried before the Supreme Court, his plea being that the act of the Legislature was in violation of that clause of the United States Constitution which confers upon Congress the power to regulate commerce among the States. The Court holds that, while it would be competent for Congress under this clause of the Federal Constitution to prescribe the qualifications of locomotive engineers for employment by carriers engaged in inter-State commerce, yet, as it had neglected to do so, the State of Alabama had the power to make such regulations as the one in question, and that the statute should stand, on the ground that "it is properly an act of legislation within the scope of the admitted power reserved to the State, to regulate the relative rights and duties of persons being and acting within its territorial jurisdiction, and intending to operate so as to secure for the public safety of person and property."

It is amusing to watch the applause with which the Blaine managers greet the campaign of the anti-Cleveland Democrats against the President. "Matt" Quay, the Republican boss of Pennsylvania, has taken the trouble to construct a table of delegates from the various States which foots up nearly enough anti-Cleveland men to prevent a two-thirds vote for the President, and he professes hope that the requisite number can be picked up from other States. The anti-Cleveland men in both parties are "banking" upon the two-thirds vote. The Republican Quays and the Democratic Hills alike admit that the President will have a large majority of the delegates, but they are trying desperately hard to figure out some way of preventing his getting two-thirds. This two-thirds rule is now more than half a century old, and it would seem as though it were about time to abolish it. Its first appearance was in the convention which renominated Jackson in 1832, when, pending the vote for a candidate for Vice-President, it was resolved "that two-thirds of the whole number of the votes in the convention shall be necessary to constitute a choice." During the ante-bellum period the slavery interest maintained this rule as an easy device for preventing the choice of a candidate objectionable to the South, but it has always been an undemocratic regulation, which survives only by force of inertia, and which ought to be done away with.

So far as the Democratic National Convention of 1888 is concerned, however, it is a matter of no consequence whether the two-thirds rule is abolished or not. The hopelessness of electing a third of the delegates against Cleveland is apparent at a glance when one examines the list which Boss Quay has made out. It is infinitely more likely that there will not be a vote against Cleveland in the Convention than that there will be a third of the delegates on that side. The only basis of an anti-Cleveland movement is the Hill outbreak in New York, and nobody familiar with the situation here believes that this State will send to the Convention a delegation opposed to the President's renomination. Outside of New York the Hill movement is almost invisible, and where it does attempt an appearance it is being quickly disposed of.

A stringent measure designed to prevent the use of money in nominating conventions and elections has been introduced in the Iowa Legislature. The bill provides that any person who votes fraudulently, or aids another to do so, either by threats or bribing or any other means, or who receives money or any other valuable thing, or the promise of it, for his vote, or even offers to vote in return for money or reward of any kind, or the promise of it, shall be guilty of a misdemeanor and liable to fine of not less than $200 and imprisonment of not less than thirty days; also, that any person who tries, either by the use of money or the promise of it, or by any kind of entertainment, to get support for himself for office, either in a primary, or convention, or election, shall be liable to the same punishment; all assessments for any except the legitimate expenses of election are forbidden, and any person soliciting from a candidate "money, property, drinks, cigars, or any valuable thing," for the purpose of obtaining the votes of others for such candidate, shall not only be liable to the same punishment, but shall be disqualified to vote in the election. Incorporated employers are forbidden to influence in any manner, either personally or through any one acting for them, the votes of their employees, either in primaries, conventions, or elections, under penalty of a fine not less than $1,000 nor more than $5,000.

Dr. McGlynn has at last admitted to his followers that he has no expectation of being restored to his old pastorate, or in fact to any other pastorate in the Catholic Church. He declared on Sunday night that he could not get back if he would, and he would not if he could. He would have been much

more frank and truthful had he made this statement months ago. Instead of doing so, he repeatedly assured his benighted followers that there was not only a chance but a strong probability that he would be restored. He went so far on the eve of election, in November last, to declare in the Academy of Music, that he had received private and trustworthy information that his case had been reconsidered at Rome, and that he was likely to be reinstated. There was not a word of truth in this, as any rational mind would have seen without the official contradiction which was immediately made, for the Catholic Church is not in the habit of "reinstating" its excommunicated priests who go about publicly after their excommunication shaking their fists at the Pope and all other of its authorities, and denouncing them as an "ecclesiastical machine." Henceforth McGlynn will devote himself to denunciations of the Pope, and possibly to "revelations" about other Church authorities,

---

It appears to be generally believed on the Continent that the Pope has consented to mediate in Irish affairs, on which he now considers himself sufficiently well informed through the reports of Mgr. Persico. The Liberal Unionists have been flattering themselves for some time that such a gentlemanly, conservative man as the Pope is must be disgusted with the conduct of the Irish, and that the mission of the Duke of Norfolk, and the Queen's handsome present on his jubilee, must have confirmed him in his hostility to home rule, and made probable an early reprimand to the Irish clergy for meddling in politics. The latest reports are, however, that he is prepared to meddle in the matter only to the extent of recommending a partial adoption of Mr. Gladstone's scheme—that is, the concession to the Irish of a local legislature with more limited powers than Mr. Gladstone's was to have, and the retention of the Irish in an imperial Parliament in London.

The reception given in Dublin to Lord Ripon and Mr. Morley, besides being a welcome to them, has been a sort of counter demonstration, intended to neutralize the effects of that given some weeks ago to Lord Hartington and Mr. Goschen. This last was in no sense popular, and the recipients had to be carefully guarded by policemen during their stay. Any weight it had it derived from the number of professional men and landlords and bankers who took part in it, and the numbers of these classes were set out in the Conservative newspapers with amusing particularity. Mr. Goschen, in fact, went so far as to say in his speech that "wealth and intelligence" were everything in such matters, and numbers of no consequence. The Ripon-Morley demonstration, however, makes a very good comparative show in the matter both of wealth and intelligence. It has produced a remarkable list of professional men, merchants, and clergymen of all denominations also, and of course in numbers and enthusiasm it has outdone anything seen either in England or in Ireland for many years. The effect of this on the Tory press in London seems to have been somewhat stunning, mainly owing to the somewhat amusing theory which the editors have long been preaching, that the great bulk of the people of Ireland are hostile to the present agitation, but are terrorized into acquiescence by the National League, and have been made to elect the Parnellite members of Parliament by a system of intimidation. This is simply an expansion of Mr. Forster's notion that the troubles with which he had to contend were caused by a small class of "village ruffians," or petty local bullies, whose arrest and imprisonment would restore order and deliver the people from a cruel oppression. The most remarkable incident in the Ripon-Morley demonstration was, however, Lord Ripon's confession that he who, while belonging to to Mr. Gladstone's Government, had favored coercion, was now convinced that he was wrong. Lord Spencer, who had administered the Forster Coercion Act as Lord Lieutenant, made the same confession at Manchester on the same day. Of course the testimony of a man like Lord Spencer is worth more than that a mile of protests from the Hartingtons, Goschens, and those who have had no experience of Irish affairs.

The truth is, that the mere fact that the Government has to permit such a demonstration in the capital of the island makes its coercion policy ridiculous on its face. There is something farcical in trying to suppress an agitation supported by such manifestations as these, by inflicting sentences of one or two months' imprisonment on orators in other parts of the country, and locking up boys for kindling bonfires and news-venders for selling newspapers. To make such attempts as Mr. Balfour is engaged in successful, military force, used remorselessly and universally, is absolutely necessary. Men have to be shot by court-martial, and crowds dispersed by grape, and *all* newspapers suppressed or rigidly censured, and *all* orators silenced, and houses searched for papers at the discretion of the police. This is the way the Russians do it and the Turks do it and the Austrians used to do it, and the only way in which it was ever successfully done anywhere. The wonder is that Ruskin and Froude and other pessimistic politicians, who are mourning over the degeneracy of England, are not more saddened by the spectacle of nursery coercion which Mr. Balfour is affording them. It would make old Radetsky's sides ache with laughter if he were living.

English letters, no less than English and legal history and philosophy, have sustained a serious loss in the death of Sir Henry Maine. No man has in this century done so much to stimulate the study of the history of legal ideas, or has thrown so much light on the origin of political institutions. Much of his success was due to the charm of his style, which was remarkable for its lucidity, and he had in almost as great a degree as Tocqueville the gift of fascinating generalization. This led him in his last work on 'Popular Government,' when the conservative fibre in him had been hardened by years and infirmity, to make excursions into the region of contemporary politics, in which he did not always sustain his earlier fame for philosophic calm and breadth of judgment. But this book was so plainly a party pamphlet (it was, in fact, made up of contributions to a political magazine) that it did not lessen in any degree the weight of his authority in the fields which he had been the first to open, and his labors in which must keep his memory in undying honor.

The Paris *Temps* says that "people who ought to know" in France say that a remission of the duty of 30 per cent. now levied by us on imported foreign pictures would be injurious to French artists, because it would lead to the flooding of the American market with counterfeits, which would have a wide sale, because Americans know no better than to buy them, and because the American law offers no hindrance to their sale. The result would be after a while that French art would be utterly discredited in the eyes of connoisseurs, and the demand for French pictures would wholly cease. They suggest, as a remedy for this, that if the duty be abolished, the American Custom-house should require consular certificates of genuineness for all imported pictures. We fear, however, that before procuring this legislation, these anxious Frenchmen would have to convince a good many Congressmen that a forged picture is not just as good as a genuine one, and is not better if it be cheaper.

The story about the intention of the Mexican Government to place an export duty on ores has been as persistent in turning up in different and contradictory shapes, and has been as inherently improbable, as many another yarn telegraphed from that land where the imagination works so freely. First it was said to be a part of an English plot to interfere with American trade. This was soon denied, authoritatively, but was speedily followed by the assertion, which is the latest we have seen, that the duty was to be levied, and that it was at the instance of American capitalists who were to be benefited by it in some unknown way. As we say, the story is improbable on its face. Reference can only be to the ores of the precious metals, since Mexico produces an inappreciable quantity of any other kind. For the year 1885-86 her exports of metals other than gold and silver had a value of only $28,977. In the same year she sent out of the country gold and silver, in various forms, to the amount of $29,878,000. But Mexico can have no possible motive to tax the export of the precious metals. They are her chief medium of meeting her foreign obligations. For years they have constituted 75 per cent. of all her exports. Besides, she tried that last inheritance of the Spanish system—a duty on the exportation of money—long enough to find out its folly. It was abandoned only about a half dozen years ago, before the protests of houses engaged in foreign commerce. There is no likelihood whatever that it will be restored,

WHAT WILL RUSSIA DO?

ALTHOUGH the publication of the Austro-German Treaty of Alliance by order of the parties to it shows clearly enough that the two Powers believe Russia to be entertaining designs more or less hostile to the European peace, the remarkable and characteristic speech in which Prince Bismarck explained the situation to the Reichstag on Monday has undoubtedly had the effect of assuring the European public that there is no immediate danger of war. But nothing could be more Bismarckian than the way in which this assurance was conveyed. What he said was, in effect, that he was determined to have peace even if he had to fight for it. He mentioned, as among the guarantees of peace, that if necessary he would put one million of men on the French frontier, and another million on the Russian frontier; and intimated that if anybody disliked his peace-preserving arrangements, he would let loose the "*furor Teutonicus*" on him. He announced the peaceableness of France with a very droll air of patronage, and produced the Czar's private assurances to himself, with a sort of mock reverence. For the Russian press he expressed the most serene contempt, but admitted that the French newspapers occasionally merited the attention of anybody who wished to know whether the French were likely to behave in a disorderly manner. It would, in fact, probably have been hard for the Chancellor to express greater contempt for French government and politics than is conveyed in the words that "the French press represents a real power, which we have to take into careful consideration." A country in which newspapers can bring on war is to him the abomination of desolation. The object of his whole discourse was, in fact, to let both France and Russia, and the whole world, know that if war broke out, it would be the greatest the world ever saw, and that Germany would not be the first to ask for peace. Of course, this is a terrible way to assure civilized men that they may pursue their industry with a tranquil mind; but it is Bismarck's way, and, as long as he lives, Europe will probably know no peace that is not guaranteed by 8,000,000 or 10,000,000 soldiers.

The most important passage in the speech, as bearing immediately on the existing situation, was, however, this:

"After 1885 a state of affairs arose in Bulgaria which we had no call to remedy by force of arms, but which cannot alter in theory the rights that Russia carried home with her from the Congress. Whether, should Russia desire forcibly to urge these rights, difficulties would arise, I know not, nor does it concern us in any way. We shall not support forcible measures, nor shall we advise their adoption. Moreover, we do not believe such an inclination exists. In fact, it is pretty certain it does not. If, however, Russia, by diplomatic means, proposes even the intervention of the Sultan, I shall consider it the duly loyal German policy to adhere purely to the provisions of the Berlin Treaty, from which, as far as I am concerned, the feeling of the Bulgarians cannot cause any departure. Bulgaria will not object with sufficient strength to plunge Europe for its sake from Moscow to the Pyrenees, from the North Sea to Palermo, into a war the issue of which nobody can foresee. Perhaps after such a war we should surely know what we had fought for. [Laughter.]"

If there be any intention on the part of Russia to force a quarrel now with Austria, if her massing of troops on the Galician frontier means anything but what Prince Bismarck suggests that it means—a piece of preparation for some still unforeseen European crisis or complication—the situation in Bulgaria is at the bottom of it. The Principality of Bulgaria was created by the Treaty of Berlin. It was, in the language of the Treaty, "constituted an autonomous and tributary principality under the suzerainty of his Imperial Majesty the Sultan." The Treaty further provided that "the Prince of Bulgaria shall be freely elected by the population and confirmed by the Sublime Porte, with the consent of the Powers." Now, the Bulgarians have not yet succeeded in providing themselves with a Prince under these conditions. Russia expected that inasmuch as it was to the victories of her armies that the Principality really owed its existence, the Bulgarians would accept an unrecognized protectorate from her, and permit the Russian agent at Sofia to play the part of the British "Residents" at the courts of the native princes in India; and that she would be allowed to nominate the Prince whom the population was, under the Treaty of Berlin, "freely to elect," and whom the Sultan was to approve and the Powers consent to.

All that was known of the Bulgarians before the war of 1877 justified this expectation. It was not supposed they could produce for many years to come either soldiers or politicians. They had figured for centuries in Turkish history as a race of patient, plodding, much-enduring peasants, without leaders or thinkers. The world was astonished, and Russia more than the rest of the world, to find that they had during the previous twenty-five years been furnished, mainly through the Roberts College at Constantinople, with an educated class large enough to supply plenty of orators, writers, politicians and soldiers to work the new constitution. Under this educated class the population proceeded to constitute a Bulgaria of its own. The Russian agents were set at naught or driven out, and a Prince was elected who never succeeded in getting either the approval of the Sultan or the consent of the Powers. He was forced to abdicate by Russian threats working on broken nerves, and another was put in his place under similar conditions. The Sultan still does not approve, and the Powers do not consent—Russia least of all; but what is to be done about it? If there is to be interference, it must be joint interference, or interference by one Power as the mandatory of the others. The Sultan is afraid to stir, owing to the horror with which Europe justly views the action of Turkish troops in Christian territory. Russia cannot interfere without being treated by Austria and England as an interloper and violator of the Treaty of Berlin. In the meantime, however, Bulgaria is increasing in wealth and prosperity and self-confidence, and is every year less and less inclined to brook any outside interference with her affairs, and the Czar is all the while exposed to the reproaches of his own people for the manner in which he has been ousted from what they consider his legitimate influence in the Balkan Peninsula.

It will be easily seen that this situation is for Russia a painful one, hard to endure. Prince Bismarck's speech does not offer any way out of it. All the comfort he proposes is that "if Russia calls on us to support, in our communications with the Sultan's Government, such of her claims as are compatible with the decisions of the Berlin Congress, I shall have no hesitation in doing so." But the only claim Russia can make "compatible with the decisions of the Berlin Congress" is that the Bulgarians shall elect a Prince to be approved by the Sultan and confirmed by the Powers. For the contingency of their refusing or neglecting to do so, the Berlin Congress made no provision at all, and this is why Russia is moody and bellicose. Moreover, if she ventured a conflict with Austria and Germany, she would have not only to face Germany and Austria but Bulgaria, which can undoubtedly put 50,000 good troops in the field, and Servia, which can put as many more that are just as good if well led, and Rumania, which can probably put 150,000 in the field that are better than either. All these principalities look on Russia now as the only enemy they have to fear, after having looked to her for two centuries as their one possible deliverer and friend. In addition to these, she would have to bear the whole brunt of the Austrian attack, and at least half that of Germany, even supposing France were to take the field as her ally; for it is part of the agreement that in case France intervenes, Italy shall assail her on the south with 300,000 men. A conflict of this kind, which would set the whole European continent on fire, and the like of which has not been seen since the overthrow of the first French Empire, is not one in which Russia is likely to enter without great hesitation, even if the Czar be as morbid as he is said to be, and "the war party" as influential with him as it is said to be.

It is quite true that all that Russia has to fear from the direct effects of the war is exhaustion, such as overtook her at the close of the Crimean war. She is not a commercial country, and has therefore no serious derangement of trade to fear. Her currency is simply irredeemable paper, which can be expanded indefinitely. Her population is mainly agricultural, and would therefore suffer little from war except through the drafts it would make on labor; but these drafts would be tremendous, for the losses of Russian armies in the field, owing to defective commissariat and medical arrangements, are usually enormous. Moreover, there is probably no country so secure against invasion. No conqueror would make any permanent gain by crossing her frontier. Both her capitals are practically secure against attack, which cannot be said of any other in Europe, except, perhaps, London.

But then it has to be borne in mind that if the Czar goes to war, it will not do to come

out of it simply without loss of territory, and without having to pay a war indemnity, or having to submit to humiliating restrictions on his naval or military armaments, as in 1856. If he began it, it should be a war for the recovery of prestige which, in the eyes of the Russian people, is every day diminished by what is going on in the Balkan Peninsula. Every war which Russia has undertaken in eastern Europe since 1815 has had for its objects either the pushing of the frontier nearer to the Bosphorus, or the capture of Constantinople, or the erection in the peninsula, as a temporary expedient, of a series of vassal States, which should remain under Russian influence until she was ready to swallow them up. The wars of 1828, of 1853, and of 1877 all had these objects in view, and were all at their close apparently successful; that is, they either wrested territory from Turkey, or weakened Turkey so that her final break-up would be hastened. What is making the present crisis is the fact which is now becoming perfectly plain to the Russian court and army, and to that portion of the people which reads newspapers, that all these efforts have been literally in vain—that in making the attacks of the last fifty years on Turkey, Russia was literally, in the words of the French proverb, "working for the King of Prussia." The growth of Servia, Rumania, and Bulgaria under the fostering hand of Germany and Austria bids fair in a very short time to put an end to the vision, in which the imagination of every patriotic Russian has revelled ever since Peter the Great, of a Southern capital on the Bosphorus, and a revival of the Eastern Empire on a scale of which Constantine never dreamed. The Russian public are only just now waking up to this fact, and it is probably the most unpleasant fact in their history, the first apparently irretrievable political disaster.

The question, What is to be done about it? is a knotty one, but it is one which the Czar's advisers are probably every day asking themselves. Why troops should be concentrated in midwinter on the Austrian frontier is, of course, unless some action was in contemplation, hard to say, but it may be that it was simply due to that necessity for doing even meaningless things in times of perplexity to which puzzled people resort to relieve their nerves or gain time for thought. The conclusion which deliberation is sure to bring in this case, however, is, that unless the war ends in subjecting the whole Balkan Peninsula to Russian rule or Russian influence, it will have been waged in vain, and probably the Czar has no counsellor bold enough to tell him that any such result may safely be looked for. It will not do, when it is over, to turn to his subjects and tell them that they have at least lost nothing. On this occasion he would have to show them what they had gained.

INVESTIGATING THE READING STRIKE.

This is the time of year to look for contortions in the Legislature in behalf of Labor. There was a debate in the New York Senate a week ago on the subject of an appropriation to keep the convicts at work in the State prisons. It was as easy to discern the simulated madness of honorable members as it is to note the brief mania which seizes upon a herd of cattle when one of their number smells blood. First one and then another begins to paw the earth, and bellow, and run the horns into the ground, and "take on" at a terrible rate. After indulging in this pastime for a season they become rational again, and return to their grazing and chewing of cuds. This assumed insanity is liable to break out whenever two or three members of the Legislature or of Congress are gathered together in any public place. Congress is very much exposed to it. The resolution to investigate unlawful combinations of men, commonly called Trusts, to raise the prices of the necessaries of life, had to be amended so as not to include combinations of workingmen to raise wages. Nobody would have thought of including workingmen, but some member smelled blood and must needs paw up the ground for the edification of Labor, and all the rest must needs join for a brief space lest they be declared lacking in sympathy for workingmen. When in the House Mr. S. V. White wanted to inquire whether the Reading Railroad Company's failure to transport inter-State commerce satisfactorily was caused in any degree by combinations of men to prevent it from doing so, Mr. Anderson of Kansas, who ordinarily grazes in a rational bovine way, immediately dropped on his knees, ran his horn into the ground, and tossed up the sod in the most muscular fashion. Labor, in the remote Kansas district which Mr. Anderson represents, will undoubtedly take note of this spasm, and set it down much to the honorable gentleman's credit.

The unanimous vote to investigate the Reading strike by a special committee must have been partly given on the consideration that there is no way so effectual for curing human folly as to let it have its own way. The resolution adopted requires the Committee "to investigate forthwith the extent, cause, and effect upon inter-State commerce of the continued failure by the Reading Railroad Company to transport such commerce, and to report to the House, by bill or otherwise, for consideration at any time, such legislation as is necessary to secure to the public the regular and complete execution by a railroad company of its obligations to serve as a common carrier of inter-State commerce; and to investigate the differences existing in the Lehigh and Schuylkill region of Pennsylvania between the corporations mining coal and the miners, and, further, to investigate all facts relating to mining corporations and individual miners of anthracite coal in connection therewith, and all facts in relation to the matter, and report the same to the House with such recommendations as the Committee may agree upon."

"The extent, cause, and effect upon inter-State commerce of the continued failure by the Reading Railroad Company to transport such commerce!" Here is an assumption contrary to all the facts that the public know anything about. The history of the strike need not be recounted. It was owing to the prompt and energetic efforts of the Reading Company to perform its duties as a carrier of all commerce, both State and inter-State, that the strike began. The operatives who began the trouble insisted that freight should not be carried that had been handled by "scab" workmen. Everything that has since happened has followed logically, and swiftly, and inexorably from this premise. It is perhaps well that this fact should be put down in black and white, as it was by the Committee that investigated the Southwestern strike two years ago. That great *émeute* furnished an irresistible attraction to the demagogues in Congress. They lost all control of themselves at once. They must have an investigation by the Federal authority, and on a scale commensurate with the national dignity. They were allowed to have their own way. They found the facts to be more completely on the side of the "railroad monopolists" than the public had supposed they were. They found that Martin Irons and his crew were a lot of malefactors, and that civilized society could not be carried on in any country where their rules and practices were tolerated. The upshot of the investigation was to vindicate Jay Gould, the man of all others most obnoxious to Labor, and to rehabilitate him in the eyes of decent people, by whom, upon many grounds, he had been held in the greatest disesteem. So it will be in this Reading investigation, but with the difference that the managers of the Reading Railroad have no accumulated prejudice to contend against, as Gould had.

Mr. Rayner of Maryland has blossomed out as the champion and knight-errant of oppressed humanity in this business. He opened the debate by disclaiming the title of demagogue. This was the unconscious tribute of a trickster to the superiority of truth and reason. Then, by way of showing that he was no demagogue, Mr. Rayner charged that the Reading Company was opposing an investigation. Mr. O'Neill denied this, and asked what was Mr. Rayner's evidence of the fact. "We have the evidence," said the undaunted Rayner, "of 82,000 starving men turned out in the dead of winter with dependent families." Mr. O'Neill replied that that was not his question; he wanted to know what evidence there was that the Reading Company was opposing an investigation, adding that he knew the contrary to be true. Then Rayner "hunted his hole." He wanted to know why anybody should oppose it. Mr. O'Neill was ready for him again, and replied that nobody opposed it. But Rayner was not to be shut off in this way If he could not have anybody to fight, he could belabor the air, and so he did. "I know it is a hard fight," he said. "I know that monopoly, unscrupulous as to the methods it employs, is an enemy terrible to encounter. But in my humble experience I have never yet seen the day in the halls of legislation when honor, which has no price, or manhood, which knows no fear, could not drive it, like a skulking coward, from the field of battle."

The question came up incidentally whether

inter-State commerce had any connection with the Reading trouble, so that Congress could properly take hold of it. Undoubtedly the Southwestern trouble had to do with inter-State commerce, since the Gould roads were operated in half-a-dozen States, and since the question was one really relating to the carrying of freight and passengers. The Reading case is essentially different because the difficulty is not about the carrying of freight, but about having any to carry. The road stands ready to transport all the goods offered, coal, flour, or other. The trouble began, as we have said, with the refusal of Mr. Rayner's clients to allow certain goods to be carried, and the insistence of the Reading Company that they should be carried. It is impossible, therefore, to see where Congress gets jurisdiction even to begin an investigation. If the rules of the body required every important inquiry about which there was a doubt, to be supported by affidavit setting out some fact upon which action could be taken, no such affidavit would have been forthcoming in this case. But, we say, let Mr. Rayner and Mr. Anderson of Kansas, a worthy rival, have their way. Mr. Anderson rather took the cap and bells when he objected to Mr. S. V. White's amendment that the Committee inquire whether there had been any unlawful combinations of men to prevent the Reading Company from transporting inter-State commerce, because "it savored too much of Wall Street"; Mr. Brumm, the Greenback-Labor Congressman of Pennsylvania, and the immediate representative of the coal-miners, having accepted that amendment.

ENGLISH COPYRIGHT FOR AMERICAN AUTHORS.

Mr. Brander Matthews contributed to the *New Princeton Review* for last September an interesting exposition of the nature and extent of the piracies to which American authors have been subjected by certain publishers in England. He took the trouble to examine the publishers' lists contributed to the 'Reference Catalogue of Current Literature' for 1885, and the result, as set out in his article, affords very entertaining reading, except, perhaps, to those American authors who, like their English brethren (according to Mr. Lowell's witty remark concerning the community of books between England and America), "are not so sensitive as they should be to the doctrine of universal benevolence." The abundant examples collected by Mr. Matthews show that not only are many American authors reprinted without so much as a "by your leave," but (which is a more serious grievance) that certain English publishers not only do not hesitate to alter the titles of works so reprinted, but unscrupulously change and mangle even the very text of the stolen book, so that an author can scarcely recognize the child of his brain. After the publication of his article, Mr. Matthews applied to Mr. Samuel L. Clemens for facts concerning English reprints of his books. This drew from the latter a private letter; but, having meantime read the article referred to above, he appended what he calls a "public" postscript of considerable length and written in characteristic "Mark Twain" humor. Mr. Matthews replied in an open letter, and the three productions have been printed, under the title used by Mr. Matthews for his first article ("American Authors and British Pirates"), in the *New Princeton Review* for January.

Mr. Clemens writes much that is funny, but the substance of the serious portions of his letter and postscript can be briefly indicated. Admitting that such American books as were reprinted in England before a certain date, after which our authors could secure a *quasi* copyright in that country, had "suffered piracy without help," he asserts that five times as many English books had been pirated on our side of the water, and that, therefore, "the one fact offsets the other, and the honors are easy—the rascalities, I mean." But he characterizes the examples given by Mr. Matthews of earlier English piracies as "ancient history, and, properly and righteously, out of court, . . . a bitter grievance which passed out of this world and into its eternal grave more than fifteen years ago"; while "such of those American books as were issued after England allowed us copyright, and yet suffered piracy," Mr. Clemens holds, "suffered it by their authors' own fault, not England's nor anybody else's," because England furnishes the American author what he calls a "perfect remedy."

Mr. Clemens fails, however, to make the perfection of the remedy clear, nor is he at all lucid in his explanations as to how the remedy is to be obtained or applied. On the first page of his paper the reader is informed that "to-day the American author can go to Canada, spend three days there, and come home with an English and Canadian copyright which is as strong as if it had been built out of railroad iron," while on the last page he says of the English law that it is "a law which gives us absolutely unassailable and indestructible copyright at a cost of not a single penny, not a moment of time, not an iota of trouble, not even the bother of asking for it"; and the circumstances under which such copyright is secured, he says, "are quite simple and explicit, and quite easy to inform one's self about." Setting out by way of comparison the details essential to securing copyright in the United States, he exclaims: "What do you have to do in order to get the same book copyrighted in England? You are hampered by no bothers, no details of any kind whatever. When you send your manuscript to your English publisher, you tell him the date appointed for the book to issue here, and trust him to bring it out there a day ahead. Isn't that simple enough? No letter to any official, no title-page to any official, no fee to anybody; and yet that book has a copyright on it which the Charleston earthquake couldn't unsettle." Two years ago Mr. Clemens stated before the Senate Committee on Patents that the American author could get in England "as perfect a copyright as it was possible for a Government to give," and that this copyright was as strong for forty-two years as one granted to a native English author, and that it was quite easy to get —"there was no difficulty about that." But when asked by what process the American author could secure such copyright, his answer was: "'I have been through so many processes that I hardly know how to explain it." He has now published a veritable "Mark Twain" explanation of the process, after reading which no one will twit Mr. Clemens—as he does his opponent—with being a lawyer.

Mr. Matthews's reply is entertaining, judicial, and to the point. After setting himself right as to the motive of his article, he adds to his previous illustrations a number of examples of the piracy and mutilation of recent American books by English and Canadian reprinters. He analyzes the two English decisions upon which alone copyright is secured to foreign authors, and deduces the opinion, which is, we think, the only safe one, that, "if an American author wishes to make sure of an English copyright, there is only one course for him to pursue: he must publish his book in the United Kingdom before he publishes it in America, and he must be in the British dominions when it is so published in the United Kingdom." Admitting that this British law is a good thing as far as it goes, Mr. Matthews holds that it does not go far enough, and that it does not go so far as Mr. Clemens thinks. He points out that while it may be an easy thing for the latter to make a trip to Canada, it does not follow that it is equally easy for every author, and that it certainly is not easy for a poor author who may chance to live in Florida or in Texas. Prior publication in England, also, while an easy thing for authors well known, is not easy for the unknown author sending out his first book. While Mr. Matthews seems to think that a contributor to one of the leading American magazines which is published in London a day or two before it appears in New York, might secure the protection of the English law by taking a monthly trip to Canada (a requirement amounting to a prohibition), he points out that it is obviously impossible that weekly journals or newspapers should have prior publication in England, and that their contents, therefore, cannot be protected from the British pirate; so that even under Mark Twain's "perfect" law, his own book 'Innocents Abroad' could not have been protected in England, having been published originally as letters to American newspapers. "The remedy for the present deplorable state of affairs," Mr. Matthews concludes, "is to change the law" in both countries. "England has taken the first step. Our turn it is now to advance along the path of honesty and justice. England will meet us half way."

Mr. Clemens's assertion that he has, by virtue of his three days' residence in Canada, secured copyright in that country as well as in England, is not noticed by Mr. Matthews. But if he has any such copyright, he certainly does not obtain it, as he states, without the payment of a fee, for registration is essential to obtaining copyright in Canada, and a fee of $1 is charged for each entry. More-

over, a copyright is not registered until the author has deposited two copies of his book, and unless such deposit is made the author is not entitled to the benefit of the Canadian Copyright Act; and, furthermore, it is a condition of obtaining copyright, according to this act, that the work in question "shall be printed or published, or reprinted and republished, in Canada," and all of these stipulations apply with equal force to a book which may have been previously copyrighted in the United Kingdom. If a visit to Canada is essential in order to secure protection in England, it is clear that it would be necessary to have something to prove that the author had been upon Canadian soil at a certain time, requiring, at least, a notary's certificate, demanding a fee. And while the English law does not require registration in order to obtain a copyright, it is necessary to register such copyright in order to maintain a suit in court to protect it; and a deposit of a copy of the book for the British Museum is compulsory, within one month, while demands for copies from four other libraries must be complied with when made. All of which it is not so much easier to do than it is to satisfy the requirements of the American copyright law, as Mr. Clemens seems to believe. As Mr. Matthews very justly says: "The method by which an American may secure copyright in England is not a simple registration, for which a single fee is paid and a single certificate given: it is an elaborate mercantile operation, to be established by evidence, written and parol."

THE TRUE FUNCTION OF A UNIVERSITY.

As usual, many topics in President Eliot's Report on the condition of Harvard College for the past year invite comment. One might dwell on the seeming paradox that, while more than a million dollars has flowed in through the medium of gifts, almost every branch of the University suffers from inadequate endowment; or on the caprices of benevolence, which provides inordinate support for needy students, while neglecting the claims of the professorial body to a juster compensation—which recognizes the humane aspects of the Medical School and shuts its eyes to those of the Dental School, equally engaged in the gratuitous reduction of suffering. These, however, are standing themes. The novel discussions which we annually expect from the head of the oldest university in the land, relate this year to efforts made to raise the level of instruction in English in the schools which feed the college—not Harvard alone, but all colleges—and to enable the same schools to teach, in some form or other, the rudiments of science.

The importance of these endeavors, extending over a dozen years, will not be underrated by any thoughtful person, least of all by professional educators. They have met with a fair measure of success, but the report of progress will not be closed for many a day. We shall content ourselves with recommending to the general attention President Eliot's remarks upon them. Half a page devoted to intercollegiate athletics has for us a greater momentary interest, in that the purpose is manifested to abate a growing evil about which too little has been said. What goes before is retrospective; in this section of the Report lies the germ of a future policy.

Nothing could be better, as a condensed statement, than the following words of the Report, after an approving enumeration of the various sports pursued with ardor by the students:

> "Three of these sports," says President Eliot, "namely, foot-ball, base-ball, and rowing, are liable to abuses which do not attach to the sports themselves so much as to their accompaniments under the present system of intercollegiate competitions. These abuses are: extravagant expenditure by and for the ball-players and the crews; the interruption of college work which exaggerated interest in the frequent ball-matches causes; betting; trickery condoned by a public opinion which demands victory; and the hysterical demonstrations of the college public over successful games. These follies can best be kept in check—they cannot be eradicated—by reducing the number of intercollegiate competitions to the lowest terms. The number of these competitions is at present excessive from every point of view. Wrestling, sparring, and foot-ball—games which involve violent personal collision—have to be constantly watched and regulated, lest they become brutal."

The development of this perfectly just indictment would bring to view four main tendencies, which must be deprecated by every friend alike of the higher education and of morality. One is towards the prolongation of the boyish or puerile stage which ought finally to be cast away when the young man enters college. We do not mean that animal spirits should be left behind, but that the point of view from which life has hitherto been regarded should be radically changed. Intellectually, the student should feel himself to have come of age as soon as matriculated, and should perceive the propriety or necessity of putting away childish things. Sports need not be abandoned, but just as they will no longer be marbles or peg-top, so they should be subordinated to the main object for which men go to college. The dignity of the institution should beget a corresponding dignity and self-restraint and steady application in the beneficiary. The unspeakable importance of these years for the cultivation of the faculties and the formation of character in preparation for the struggle for existence, should sober and steady all but those already corrupted by the taint of wealth. But it cannot be denied that childishness is fostered by intercollegiate contests, not only in the shape of "hysterical demonstrations over successful games," but in giving such a predominance to the athletic interest that recreation and enjoyment, or the having what is called a good time, becomes the most potent attraction which a college education holds out. It is a significant fact, too, that the rise and growth of the highly organized and technical forms of sport at Harvard has been coincident with the revival of secret societies—the permanent fountains of puerility—and of hazing.

The second tendency in order is towards the erection of a false standard of superiority among colleges according as one or other "carries off the cup." Harvard, for example, a purely educational foundation, whose glories antedate the advent of base-ball and the Rugby game, is regarded as humbled if Yale or Princeton or Columbia comes off first in any given contest or series of contests. This feeling is not put on, but is perfectly serious among students. You will find them in their local papers discussing the harm that will befall the college if it continues to win only second and third prizes. The athletes of the preparatory schools, it is said, will instinctively be drawn to the college which has achieved the highest distinction in their line. It has even been charged lately that a systematic attempt was making to recruit from a certain famous New England school for one college at the expense of another by means of a subsidized local journal—if our memory is not at fault; of course through undergraduate, not official intrigue. We have also an idea that the faculties of the smaller colleges are afraid to grapple with the evil of abnormal athletics because they do really apprehend a loss of patronage. But be this as it may, it is clear that nothing could be more opposed to the efficiency of the college training than an habitual substitution, for pride in the intellectual standing and ample equipment of Alma Mater, of pride in her muscular supremacy. Do we not, in fact, see colleges which are lagging in the race of improved methods and enlarged scope of instruction, hug the delusion that this is offset by the trophies of the sporting-ground? Let us, then, remark here that all the trophies of this sort that Harvard has ever won by land or sea, are as dust in the balance compared with the simple fact that her President's annual Report is out of sight the most weighty, influential, and eagerly anticipated educational document published in America.

The third tendency may be briefly dismissed because there will be no dispute about it. The intercollegiate games bring the college world down to the level of the professional gambler. It is incontestable that students whose minds are constantly filled with the thought of intercollegiate rivalry at sports, follow with the greatest zest the course of the professional matches all over the country, turn to them first in the morning paper, make them the staple of their conversation. This is bad enough, but unavoidably they catch the tone of these vulgar performances, they practise or are on their guard against "trickery condoned by public opinion," and above all they fall easily into habits of betting on the result. The ill-feeling thus engendered, the charges of foul play, unfair umpiring, spying, concealment, lying, are disgustingly visible on the grounds or in the echoes of the college press. No man ever felt elevated by witnessing such encounters, and their degrading influence speaks both to the eye and to the understanding.

Great masses of young men cannot thus be brought together with professional excitement and manners without abusing the opportunity in other ways. Nor can parents reflect without wincing on the possibilities which attend the transfer of a mob of students away from their habitual surveillance to a

distant city, there to remain, perhaps, over night, in a state of the highest elation or depression—were it merely innocent and not affected by money at stake on the result of the game. Neither, finally, can this transportation take place without a large pecuniary outlay, which falls upon the parents, whether they can afford it or not. Add this sum to the cost of sustaining crews and teams, and to what is lost in gaming and in vice, and we have a potent factor of extravagance in ordinary college life the fourth tendency of those we have deprecated.

Much more might be said if we had the space. We regret that President Eliot should imply that the intercollegiate competitions cannot be absolutely abolished. Nothing is simpler than an edict to this effect, and we believe that it is Harvard's mission to utter it. She ought boldly to take the position that beyond furnishing ample facilities for in-door and out-door exercise, for the perfection of the physical man, the college has nothing to do with athletics unless to supervise them. Its business is to shape the human intellect. Neither should it be moved by the argument—sound or unsound, matters not—that without the intercollegiate meetings the local fondness for athletics would die out. Again, we say, this is no concern of an institution which has done all that money and science can do to tempt men to exercise. But it is absurd that a thousand undergraduates cannot among themselves find all the competition necessary for any good end of sport. The rubbish about "records" needs to be put aside. It is not incumbent on any college to see that its students jump one foot higher, run one minute faster, or in any other way approximate a receding standard of physical excellence. Health may be attained, and sound constitutions, by moderate, well-directed exertion without thought of any competitor. So long as this is so, the duty of the college is to turn the student's thoughts to things spiritual; to encourage early manliness, as the entrance age is steadily rising; to discourage respect for the non-essentials of college life above its main excuse for being; and to put an end to all occasions for unfriendliness and bitterness between institutions whose only emulation should be to turn out, at the least possible cost, the highest type of civilized man.

VOLAPUK.—I.

UNIVERSITY OF MISSISSIPPI, January.

"HAS Volapük come to stay?" asked the *Nation* some time ago. That remains to be seen; but at any rate Schleyer's invention has come to make quite a visit, and it may be of interest to submit the new arrival in the family of languages to some inspection. Its rapid growth, and the favorable reception it has met with in high quarters, give it a claim to have its merits or defects submitted to examination.

Johann Martin Schleyer, a German, and a retired Catholic priest, is the last in a series of language-makers that runs back beyond Leibnitz. For Leibnitz, in his 'De Arte Combinatoria' (1666), gave an account of Becher's system, and Becher was preceded about a year by Delgarno (1660, 1661). Leibnitz briefly describes Becher's system as proceeding upon the following plan: By each word in an alphabetically arranged Latin lexicon a number would be placed. In any other language a dictionary was to be prepared with the numbers following consecutively, as in the Latin lexicon, and by each number would be found the equivalent of the Latin word; *e. g.*, if *bellum* had 500 by it, 500 would have *war* by it in an English lexicon, *Krieg* in a German one, and so on. To read this number-language one would simply look in his lexicon for the words attached to the numbers. To write it, one would need to know Latin and to look up the proper numbers in his Latin lexicon; or, if he did not know Latin, he would be obliged to have in his own language an alphabetically arranged dictionary with the proper numbers attached; for, of course, his other lexicon, being prepared with consecutive numbers as the only guide through it, would not avail him here. It does not need a Leibnitz to point out the extreme clumsiness and glaring deficiencies of such a system. The great German philosopher himself proposed a scheme of which he said that if it were rightly and skilfully carried out, his *scriptura universalis* would be easy to learn, common to all, and capable of being read without a lexicon, "simulque imbibetur," adds Leibnitz, "omnium rerum fundamentalis cognitio"—certainly a desirable characteristic, especially in a system easy to learn. But as Leibnitz made nothing practical of it, though greatly interested in the problem of a world-language, no doubt to do it "rightly and skilfully" was the reef on which the idea was wrecked.

In 1668 appeared one of the most famous of all the attempts to counteract Babel's confusion of tongues. In that year Bishop Wilkins published his 'Essay toward a Real Character and a Philosophical Language,' having received the hint from Delgarno's 'Ars Signorum,' or, 'Character Universalis et Lingua Philosophica' (1660). The treatise of the English Bishop is known to us from the detailed account of it given by Monboddo and Prof. Max Müller. But even a hasty survey shows that such a scheme would never do for the wayfaring man, even though he were no fool. If we are ever to have a language common to all the world, it would seem that it must at least possess the following characteristics:

(1.) It must not be intricate. Simplicity is absolutely essential. If a philosophical turn of mind is required for its understanding, it is doomed.

(2.) It must be in a character easily written and easily read.

(3.) It must reject sounds that are difficult or impossible to any large portion of mankind. Our *th* sound would be altogether inadmissible (and Volapük has not admitted it), and to base distinctions of meaning upon such a difference as we make in this sound (*cf. though* and *throw*), would be utterly out of the question.

(4.) It must be brief enough in the statement of its principles to give it a decided advantage over any widely spoken language.

(5.) Of course it must possess uniformity. No one would deliberately invent exceptions to his rules. Enough of these may spring up in the course of time.

Let us test Volapük by these principles.

As to brevity, hardly any one can fail to be satisfied. Spielmann's Volapük-Almanach gives a very good outline of the grammar in 16 pages. Schleyer's Mittlere Grammatik (8th ed.) has only 63 pages for the grammatical portion, and Seret's Volapük grammar for those who speak English has only 59 pages of grammar, the rest of the 420 pages being taken up with the vocabularies. The world can surely afford to learn this much in order to have a medium of communication between all mankind.

In simplicity it has some striking advantages. The large majority of its root-words are monosyllabic. Diphthongs are not allowed. The definite article is eliminated. Exceptions and irregularities there are none. A German inventor did not forget, of course, to simplify the matter of gender. The three oblique cases, gen., dat., and accus., are formed by appending to the word the first three vowels respectively, *a*, *e*, *i*. The plural adds *s*. Thus *foot* is declined *fut*, *futa*, *fute*, *futi*, plural, *futs*, *futas*, *futes*, *futis*. And this is the whole of the inflection of nouns.

The agent (*maker*, *creator*, Germ. *Macher*) adds *-el* to the root-word. It would be *er*, except that Schleyer has avoided *r* out of consideration for children, old people, and the Chinese. Adjectives append *-ik*. The comparative and superlative endings are *um* and *ün;* and as *m* precedes *n*, it belongs to the comparative, which precedes the superlative. Adverbs at first followed the German method, and did not differ from the adjectives, except that an adverbial ending *o* was used if clearness required it. The Volapük Congress held at Munich last August declared in favor of making *all* adverbs end in *o*, though the rule is not an imperative one. The personal pronouns all begin with *o* and vary the final consonant. With *m* for *masc.*, *f* for *fem.*, and *s* (German *sächlich*) for *neut.*, it is easy to learn *om*, *of*, and *os* for *he*, *she*, and *it*. *On* is adopted for German *man*, French *on*. *Ob* stands for *I*, *i. e.*, to *o* is added the first consonant. Then *oma*, *ome*, *omi* mean *of me*, *to me*, *me*. The poss. prons., being adjectives, end in *ik: omik*, *ofik*, *osik* therefore mean *his*, *her*, *its*. The nine digits all end in *l*, and the *l* is preceded by the eight vowels in order *a*, *e*, *i*, *o*, *u*, *ä*, *ö*, and *ü*, except that after 6 (*mäl*), 7 is *vel*, which strikes us as a slight defect and a departure from uniformity. Volapük grammar opens with the eight vowels above given, and Schleyer frequently uses a, e, i, instead of 1, 2, 3, to number his paragraphs. If he had let his numerals proceed through 8 without any break in the succession of vowels, it would have been a gain. As he has it, one must remember that there is an arbitrary break in the order, and that it occurs after 6. If the break had occurred after 5, there would even then have been some method visible; for the division would have been made between the five simple and the three modified vowels. One cannot help wondering, too, whether Schleyer had any system in his mind in selecting the initial consonants for his numerals. His words are *bal*, *tel*, *kil*, *fol*, *lul*, *mäl*, *vel*, *jöl* (pronounced as *schöl* would be in German), *zül*. Suppose he had employed the first nine consonants in Volapük (b, c, d, f, g, h, j, k, l, i; the Munich Congress adopted h instead of the "rough breathing" with which Schleyer at first began), followed by the vowels in like order, with *a* repeated as the vowel for 9; the memory would be strongly supported. For 10, 20, 30, etc., *s* is added to the words for 1, 2, 3, etc. *Nought*, *zero*, though not given in the grammar, we find to be *nosanum*, *i. e.*, *no* as a negative, *s* as neuter ending, *a* as genitive ending, and *num* as the word for *number*, so that *negation's number* is Volapük's conception of zero.

When we come to the verb, we find only a fraction over five pages given to it in Spielmann. Schleyer has about eighteen pages, and Seret twenty-nine and a half. Some things about Schleyer's treatment are admirable. The infinitive ends in *-ön*. For the present, imper-

fect, perfect, pluperfect, future, and future perfect, the vowels a, ä, e, i, o, and u are respectively prefixed to the stem. If no vowel is prefixed, the tense is understood to be the present. In the passive voice *p* is prefixed to the proper vowel for any given tense. Hence, if *sanön* means *to cure*, (a)sanob = *I cure*, pasanob, *I am cured*, posanof, *she will be cured*, pesanoms, *they* (masc.) *have been cured*. So far, we could ask nothing better in a verb-system based on the synthetic principle. Does Volapük recognize any need for duplicating the above tenses by having a progressive form for each, as we have in English? *Penön* means *to write*. Can the new language make the distinction between *I shall write* and *I shall be writing*? If we go by Schleyer, we find nothing satisfactory. Seret speaks of an *aorist active* in all verbs, and seems to expect us to know exactly what that means. We find that each of the six tenses may have an aoristic form, and at once, on the basis of ἔγραφον, *I was writing*, and ἔγραψα, *I wrote*, we think this "aorist" in Volapük must denote the forms *I write*, *I wrote*, etc., as opposed to *I am writing*, *I was writing*. Seret gives a number of examples, in which the *i* that denotes this idea in Volapük is rendered by the adverbs *usually*, *constantly*, *always*, *steadfastly*, *uninterruptedly*, *incessantly*: so that *aipenom* may mean *I write usually*, *I write constantly*, etc. When we turn to Spielmann's account of this *i* formation, we find that he agrees with Schleyer in calling it "die Dauerform (Durativ)," and we at once think of the progressive forms; but when he explains the formation by adding that it denotes the indefinite time of an action, or a customary action (*die Gepflogenheit einer Handlung*), we feel that we are tossed back to the other horn of our dilemma; he translates the forms by *stets* and *beständig*. Seret gives the following three sentences as instances of this usage: "Much happens against the expectation of men." "Yet all winters have brought cold." "Every war the noble philanthropist will have to repent." This sort of treatment reminds us, on the *lucus-a-non* principle, of Schleyer's statement that his language is "very clear and definite in expression, admitting no uncertainties or confusions of meaning"; and of his exhortation, "Let every one always express himself so simply, concisely, and clearly, that all intelligent inhabitants of the globe can understand his words." When this happens—when obscurity of thought and expression is done away with—we shall have an intellectual millennium. Unfortunately the Volapük verb does not seem to us very much adapted to hastening this happy state of things.

In addition to the twelve indicative tenses as given above, Schleyer has subjunctive, conditional, optative, imperative, infinitive, participle, and supine, each with the full array of twelve tenses, active and passive. Not that these are all put down in the grammar in every instance, but enough samples are given to lead to the conclusion that every mood is to have its twelve tenses. There is also an imperative participle, with the renderings "be a loving one," and "be, being loved." We are furnished with a Gerundivum, "one, that *must* be loved"; and a Gerundium, "*it* is to love, one must love (it)." Reflexive, reciprocal, and impersonal verbs are provided in both voices. There is also an intransitive passive, examples of which are (Seret, p. 52, end): "*pagolos*—going, is getting done. *pagolom*—*it* is getting gone (in: one goes that road, the road is getting gone)." The optative has two forms, a mild form ending in *-ös*, and a stronger form in *-öx* (though one of the numerous little handbooks speaks of this as "the milder" form). The imperative is likewise subdivided: the ordinary form ends in *-öd*; the stronger, in *-öz*, called by Schleyer *der Jussiv*. The Volapük optative was constructed to be what its name denotes, a wishing mood. But as expressions of wish naturally shade off into those of will, it is no surprise to find the treatment of these two moods blended, and some of the books treat as imperative what others count as optative: and we even find the form in *-öx* spoken of as a potential. We have, then, for expressions of wish and of will, a climax ascended by four steps: *-ös*, *-öx*, *-öd*, and *-öz*. Each of these four, we are to bear in mind, is capable of forming twelve tenses active and passive, with six forms in the singular (*I*, *thou*, *he*, *she*, *it*, *one*), and four in the plural, of each tense!

The Greek verbal system with 507 possible forms, as estimated by Curtius, is usually regarded as rather formidable. Curtius calls the 891 forms reckoned as possible in Sanscrit, "a gigantic number." But his countryman has invented a system of conjugation in which *over half a million* of forms are possible from almost any transitive verb! The Athens Ἑστία gives the exact number as 504,440, but comforts us with the assurance that all these forms can be taught *within five minutes*—not that this is so, at all. Here is anything but brevity, whatever may be said for this colossal system as regards uniformity and simplicity.

ADDISON HOGE.

THE WAR CRISIS ON THE CONTINENT.

PARIS, January 27, 1888.

EVERY year now brings its war panic. These great waves of alarmed patriotism and of national jealousy seem to come over Europe as regularly as the great atmospheric changes of the seasons. It will be so as long as we have a system of armed peace as onerous as war itself. The slightest incident which brings into contact the great latent masses of electricity, seems the beginning of the impending storm. The latest war panic has not been produced by direct contact between France and Germany; this time the two opposing forces have been Germany and Russia. Since the events which have recently taken place in Bulgaria, the hostile feelings of Russia towards Germany have had almost free play. Russia, whether she is right or wrong, feels that she has been cheated by the Treaty of Berlin. She counted upon a sort of supremacy in the peninsula of the Balkans; she has lost this supremacy by a succession of blunders, and she now sees that Bulgaria, which she meant to be a mere dependency, is assuming airs of independence, and, if it cannot be independent, is drawn towards Austria's sphere of influence. The old alliance of the three emperors is a thing of the past; instead of it we see an alliance of two emperors only, and the third emperor remains in a sullen isolation, and obeys more and more the influence of the Panslavist orthodox party.

If there had been, a few months ago, a Government in France capable of forming secret alliances, the temptation would have been very great in Russia as well as in France. If Russia has her Panslavists, France has her radicals, who advocate openly an alliance with Russia. Gen. Boulanger did not make much mystery of his tendencies and his projects. At the time of the Presidential election, Jules Ferry was denounced by the extremists as the instrument of Prince Bismarck, as the slave of the German Chancellor.

There is no doubt that the French people desire the continuation of peace. They have a vague, unreasoning, instinctive sympathy for Russia; and the reason of it is that there are really no points of contact, and, therefore, no differences between the two nations. I remember that even during the Crimean war this sympathy existed. The Crimea was very remote; our officers and soldiers were often irritated at the English; they only saw the Russians after the taking of Sebastopol, when peace was made. The war party, which is a very small minority in the country, plays upon their feelings; it represents the Russians as all ready to take arms against Germany, and to continue the war until France has had time to reconquer Alsace and Lorraine. In Russia the Panslavists do something of the same sort. They believe that, if a war arose between their country and Germany, France would be forcibly drawn in, and, as was once said, "les chassepots partiraient tout seuls." The difficulties of an alliance, however, between France and Russia are obvious; the circumstances are not at all the same on our frontier and on the Russian frontier. If a war broke out between Germany and France, and if France should be obliged, by treaty, to begin military operations, her mobilization would be ended in a few days, as well as the German mobilization, while the Russian mobilization would take weeks and months. Germany would have time to throw the bulk of her forces on France, and perhaps to strike decisive blows, before commencing the struggle with Russia.

I do not believe there is anything like a treaty between France and Russia; but, if there is no treaty, there can be between two governments a sort of understanding, a mutual confidence, a state which allows each to give and to receive advice. The adversaries of a common action between France and Russia have always maintained that there is no equality between the risks which these countries would run in case of war; that in order to produce some equality, Russia must make a sort of mobilization in time of peace, so as to be able, if war is declared, to begin at once offensive operations of some magnitude. The system of armed peace and of hasty mobilizations will oblige the Powers which do not control many railways, and which cannot in consequence mobilize rapidly, to locate their armies near the frontiers in time of peace. It is difficult to know exactly the movements of the Russian troops. According to the temper of the official press in Berlin and in Vienna, these movements are more or less threatening; the Russian press tries, of course, to reduce their importance to a minimum. Still, enough is known to enable us to state that Russia has taken, in a military sense, important precautionary measures.

All military operations in the valley of the Danube and in Poland are impossible, or, to say the least, extremely difficult at this time of year; but we may expect in the spring to see the development of the Russian policy. Meanwhile, Germany is taking its precautions; Italy has replaced Russia in the triple alliance; the journey of Crispi to Friedrichsruhe marked with a sort of ostentation the character of the new alliance. The relations of France and Italy have become more difficult; the plenipotentiaries who went to Rome for the renewal of a treaty of commerce have not yet succeeded in their undertaking. The incident of the Consul at Florence caused at one moment great uneasiness; it seems now that nothing will come of it, but it has raised indirectly the question of Tunis and of the French protectorate in that province. The Treaty of the Bardo did not put an end to the treaties made at various times between the Bey of Tunis and sundry European Powers. The French protectorate of

Tunis has not yet been fairly recognized by Italy, nor by any other Power, and fresh difficulties may arise at any moment from this situation. It is assuredly singular and painful to see Italy, which owes so much to the French arms, taking deliberately her place in an alliance which, though it professes to be made simply in the interest of peace, is known to be made also for war and in view of all the eventualities that may arise from a struggle between Germany and France, as well as between Germany and Russia.

In this extraordinary state of things, in this painful suspense and dread of the future, it is not surprising if all eyes in Europe are turned towards England. What will Great Britain do? In which direction will she gravitate? Will it be towards the triple constellation of Prussia, Austria, Italy? Will she obey her instinctive fear and hatred of Russia? Will she hesitate and refuse to give her moral support to the German power, which is becoming too predominant and too absorbing? Lord Randolph Churchill's journey in Russia would not have attracted so much attention if these questions were not in people's minds. It is well known in England that Lord Randolph Churchill had no diplomatic mission; it is even whispered that his relations with the members of the Cabinet which he has left have become somewhat strained. The reasons for which he left the present Administration are still somewhat obscure. The apparent reason was his desire to reduce the expenses of the army and the navy; the circumstances required large expenses, in the opinion of Lord Salisbury, who does not wish to adopt under all circumstances a policy of non-intervention in European affairs. At the time when Lord Randolph left the Cabinet there was a strong anti-Russian movement in England. The conduct of Russia towards Prince Alexander, the young hero of Slivnitza, was denounced in the strongest terms; Lord Randolph Churchill probably became afraid that England would again drift into a war with Russia, and a war for the sake of Bulgaria seemed to him too Quixotic.

The Bulgarian agitation soon subsided after Prince Bismarck had thrown cold water on the Bulgarian sympathizers in Germany. Lord Randolph Churchill had left the Cabinet a little too soon; he is probably not undesirous to join it again. His journey to Russia was undertaken merely in order to show that he does not adopt the old Palmerstonian policy of systematic opposition to Russia. Lord Randolph is a Conservative of a new school; he understands the temper of the new House of Commons; he knows that the extension of the suffrage has given a predominant power—I will not say to democracy, but to the lowest strata of the middle classes. The new electors care little for the affairs of Europe as long as England is not directly threatened in her interests. Even the possession of Constantinople has become a second-rate question in their eyes; since the opening of the Suez Canal, Constantinople is aside from the highroad to the East.

I do not pretend to defend this contracted policy, which some people would call too narrow, too selfish, too improvident; but whoever studies the tone of the English press and of the English Parliament must see that England, having so much on her hands, has made what is called in France "la part du feu." There are many questions which in old times would have stirred England, and which now leave her quite indifferent. Bismarck once said that he would not have the bones of a single Pomeranian grenadier broken for Bulgaria; many English statesmen, if they do not speak so frankly, feel somewhat the same way. What can the little English Army do among the nations in arms in Europe? The time is past when it could weigh heavily in the balance of fortune. It is not to be wondered at if Lord Randolph Churchill has tried to impress on the Russian mind the belief that Russia will not always find England opposed to her designs—if he has sown the germ of a new *modus vivendi* between two Powers which, if divided, give to Germany the hegemony of Europe, and, if united, maintain an equilibrium of forces which has always been thought essential, from the time of Charles V. to the time of Napoleon.

THE FINANCIAL RELATIONS OF GREAT BRITAIN AND IRELAND.

DUBLIN, January 9, 1888.

THE financial relations between Ireland and Great Britain constitute one of the difficulties to be dealt with in the settlement of the home-rule question. To Ireland there are the dangers (1) that, in readjusting these relations, a mere matter of business and figures may be overlooked in the concentration of attention on the political and sentimental aspects of the question; (2) that, in striking a bargain, the weaker of the two countries may get the worst of it.

The facts are simple, but the question has been obscured by fallacious reasoning founded on the figures, which at first sight present a paradox. In order to set them out intelligently I shall use round numbers; the principles involved will not be affected by slight inexactness of figures, nor, owing to the entangled condition in which accounts are presented to Parliament, is absolute accuracy attainable.

The population of Ireland is somewhat less than one-seventh of that of the United Kingdom, viz.: 5,000,000 to 36,000,000. The total revenue raised by taxation in the United Kingdom is about £75,000,000; the gross revenue being £90,000,000. No taxes are imposed in Ireland which are not also imposed in Great Britain; but in Great Britain there are taxes, producing from £2,000,000 to £3,000.000 annually, which are not levied in Ireland. The proportion of the imperial revenue which is raised in Ireland is £7,750,000, say one-tenth of the whole. The taxation per head in the different divisions of the United Kingdom is: England (including Wales) £2 2s. 3d., Scotland £2 5s. 7d., Ireland £1 11s. 3d. Ireland, therefore, with a population of one-seventh of the United Kingdom, contributes one-tenth of the total revenue raised by taxation, and per head of population pays 26 per cent. less than England and 31 per cent. less than Scotland. Yet Irishmen complain that Ireland is overtaxed, and most Englishmen who have gone into the figures now admit it. Gladstone's home-rule scheme recognized it, though, with that tendency, characteristic of English legislation, to depart as little as possible from existing practice, even though that practice be unjust, it did not wholly remove the grievance.

It will be conceded that taxation ought to be levied in proportion to the respective abilities of the two countries to bear taxation, and not in proportion to their populations. Great Britain is rich, prosperous, and increasingly so. Ireland has been decaying in population and wealth. Before comparing the capacities for taxation of the two countries, I must explain how it is that while the taxes are the same, their incidence is different.

More than half the revenue of the United Kingdom is raised by customs and excise duties on articles of general and common consumption, the principal ones being spirits, yielding £17,000,000, tobacco £9,500,000, tea £4,500,000, and beer £8,500,000. The duty on wine is comparatively light. These articles are consumed in very different proportions in the two countries. Equality of taxation does not necessarily result from identical imposts in two countries. If a tax on tea were levied at the same rate in England and France, it would yield a large revenue in England, and but little in France. If the tax were on coffee, the effect would be reversed. In Ireland spirits are more largely drunk than beer, the consumption being one gallon per head in Ireland, against two-thirds of a gallon in England and one and a half gallons in Scotland. Beer and wine are far more largely drunk in England, and these beverages are, in proportion to the alcohol contained, much more lightly taxed than spirits. The tax on the alcoholic equivalent of beer to a gallon of spirits is one-fifth of the tax on a gallon of spirits. Ireland consumes tea and tobacco nearly in proportion to her population. Her contribution to the customs revenue is one-tenth of the whole, but under this head she consumes dutiable articles taxed in England, and not estimated as Irish revenue. She contributes to the excise revenue one-sixth, part of this being taxation on spirits and beer made in Ireland, but consumed in Great Britain. What is held to be unfair is, that, so large a part of the revenue being raised from drink, the English national beverage is lightly and the Irish heavily taxed; and that, under a fiscal system based on taxation of articles of general consumption, the incidence of taxation is in proportion to population and not to wealth.

The comparative wealth and capacity to bear taxation of the two countries is shown by the assessments for income tax. This tax is levied on the annual value of (*a*) ownership of real property; (*b*) occupation of same; (*c*) annuities and dividends; (*d*) trades, professions, profits of railways, mines, etc.; (*e*) offices and pensions. The proportion Ireland's assessment bears to that of the United Kingdom, measured by the yield of the tax, is about one-twenty-fourth under the two principal heads, *a* and *d*. Ireland's proportion is one-twentieth for *a* and one-twenty-ninth for *d*. According to this standard, Ireland's contribution to the imperial revenue should be somewhat over £3,000,000, instead of £7,750,000. Much might be said in favor of making Ireland's contribution less than this: (1.) Under head *a*, about one-quarter of Ireland belongs to persons resident in England. (2.) Under head *d*, all incomes less than £150 are exempt. The amount of incomes which just escape the tax is, in proportion to population, vastly greater in England than in Ireland. (3.) The imperial revenue is largely spent on objects with which Ireland has no concern, and in keeping up a style which a poor country like Ireland cannot afford. It is estimated that royalty costs the United Kingdom about £1,000,000 a year. England's expensive foreign and colonial policy, her costly fighting services, are for the purpose of advancing and protecting her manufacturing and commercial interests, with which Ireland, a poor and almost exclusively agricultural and pastoral country, has no direct concern. The financial relation of the two countries is as if two persons, one with an income of £24,000, the other with an income of £1,000, were to keep house together, and live at the rate of £25,000 a year; the style and cost of living would be unsuitable and ruinous to him with the smaller income.

A plea made in justification of the excessive taxation of Ireland is that the expenditure

there is also excessive—that as much is spent as is raised there. This plea is an admission of undue taxation, but the excessive expenditure is, from an Irish point of view, unnecessary, harmful, and the cause of private expense to Irish citizens. There are fewer criminals in Ireland than in Great Britain, but for each England keeps in Ireland 8¾ policemen, against 3 in England and 2 in Scotland. The presence of an undue proportion of soldiers is a very doubtful advantage. State prosecutions, a hostile magistracy, an excessive number of officials, are heavy items in the Irish expenditure. The country is kept in a state of worry and disturbance. Private subscriptions are required in defence of Irish public men, in compensation for injuries and imprisonment inflicted on them, in keeping up organizations to protect interests attacked or threatened by Government. For example, a subscription has to-day very properly been set afoot to indemnify Mr. Wilfrid Blunt, a well-known and respected Englishman, who has been sent to prison for maintaining the right of public meeting and free speaking in Ireland. We have to pay for the costly Crown prosecution, and also for the defence and incidental expenses of Mr. Blunt. The amount that has been required and raised by voluntary subscriptions in Ireland during the last ten years for similar purposes would have far more than sufficed to pay every Irish member of Parliament a handsome salary. Through this excessive taxation we have to buy a stick for our Governor to beat us with, pay the doctor's bill when we are hurt, and buy arms to defend ourselves against him whom we have equipped.

In fairness Ireland's contribution to the imperial revenue should be fixed by an impartial arbitrator, but it will be fixed by an assembly where the voting power is five to one against Ireland. Our representatives will require all the moral support in this matter which an intelligent comprehension by their constituents of the facts and figures can alone supply.

The inequality of taxation between the two countries is not due to any malice on the part of English statesmen against Ireland. They have legislated for the United Kingdom regardless of Ireland. The question concerns the classes and the masses as much as the two countries. Under the system by which more than half the revenue is raised by taxation of articles of general consumption, and levied not on values, but quantities, the poor pay very much more than the rich, both in proportion to their means and to the value of the articles used. The system will probably be changed as soon as the newly enfranchised masses become aware of the real incidence and effect of the taxes now levied. Instead of diminishing the income tax in years of prosperity, they should require the exemption from all duty of necessaries and luxuries in general use, such as tea, coffee, tobacco, and fruit. The Government of the United Kingdom is still too much in the hands of an aristocratic ring, and it will take some time to shake off the political and administrative grip they have on the nation.

AN IRISHMAN.

Correspondence.

MR. EDMUNDS AS A POLITICAL ECONOMIST.

TO THE EDITOR OF THE NATION:

SIR: Senator Edmunds, in an article on the tariff in the February number of *Harper's Monthly*, claims that when the duty on a foreign product is reduced, the foreign producer raises his price by an amount substantially equal to the reduction of duty; and therefore the foreign producer and not the American consumer is the gainer. He instances the effect of the act abolishing the duty on tea and coffee, and assumes to quote the wholesale prices of those articles six months before and six months after the passage of the act. The quotations given by him do not show a decline equal to the amount of reduction of duty, and he infers that the foreign producer raised his prices.

The Senator's quotations of tea are so far wrong as to suggest the possibility that he obtained them from his Vermont grocer, who had not learned of the abolition of the duty. The act abolishing the then existing duty of fifteen cents per pound was passed May, 1872, to take effect July, 1872. I give below quotations from the monthly tea circulars of Messrs. Beebe & Brothers of New York, dated November 18, 1871, and November 19, 1872, the dates being about six months before and six months after the passage of the act. Messrs. Beebe & Brothers were the highest authority in the country, and the accuracy of their tea circulars no one in the trade would venture to deny.

QUOTATIONS IN GOLD FOR NEW-CROP MOYUNE, TAENKAI, AND FYCHOW GREEN TEAS.

Hyson,	1st	60@65c.	"
"	2d	45@50c.	"
"	3d	32@37c.	"

As the prices of November, 1872, were lower by even more than the amount of reduction of duty, it is evident that the American consumer and not the foreign producer was the gainer.

The proper basis of comparison, however, is the prices obtained by the China producer. By reference to the *Overland Trade Report* of Shanghai, and to the circulars of the leading houses doing business with the United States, it will be found that teas were lower in China in November, 1872, than they were in November, 1871. China produced tea for all the tea-drinking countries. Their demand and her supply determined the prices she was able to obtain. The United States took but a portion of her supply. For the China producer to appropriate the duty removed, by raising his prices, was as impossible as it would have been for him to raise himself by his queue. The facts were, that the American consumer obtained, in a very short time, the full benefit of the removal of the duty, and also of the profit on the duty that the dealer formerly charged.

WILLIAM SIMES.

BOSTON, February 6, 1888.

A SELF-OPERATING TERMINOLOGY.

TO THE EDITOR OF THE NATION:

SIR: In the opening sentence of his article in the February *Forum*, Judge Kelley puts forth an argument which, so far as I have seen, stands unrivalled. He says: "That combustion consumes and that light illuminates are universally accepted propositions; but that protection in the form of customs duties protects the capital and labor engaged in the productive industries to which such duties apply, is denied by sects of discordant *doctrinaires*," etc.

Passing over the admirable alliteration, "denied by sects of discordant *doctrinaires*," which, for rhetorical effect, is very felicitous, please notice the implication involved. Not far from here lives the proprietor of a much advertised "Safe Cure" for kidney and other diseases. "That combustion consumes and that light illuminates are universally accepted propositions; but that" the said Safe Cure cures is denied by various "sects of discordant *doctrinaires*" in medicine, who thus cover themselves with utter confusion; for does not their denial make them guilty of a direct contradiction in terms? You have only to label your nostrum as doing the thing which you wish to have done, to convince any right-minded man that it is accomplishing the result.

The happily chosen misnomer "Protection," like the taking name on the patent-medicine bottle, goes far to account for the popularity of the thing named. B.

THE LOT OF THE POST-OFFICE CLERK.

TO THE EDITOR OF THE NATION:

SIR: The merits of the bill presented to Congress by the Hon. S. S. Cox of New York, providing for a classification, and regulation of the salaries, of Post-office clerks, are such as ought to insure its speedy consideration and prompt passage.

In the first place, they alone, of all Government employees, have no fixed status, with corresponding salaries. The compensation is determined by the Postmaster out of a fixed sum allowed him by the Department, and it frequently happens that a clerk in one office gets several hundred dollars more than a clerk in another office performing exactly similar duties. The salaries, even in the highest paid offices, are ridiculously small when the difficult character of the work is taken into consideration, and bear no comparison whatever with those of other branches of the Federal service, such as the Custom-house and the Internal-Revenue Department.

In the second place, the positions are such as require a high degree of skill and intelligence. All the faculties are brought into use; the clerks are constantly on their feet, cancelling, sorting, separating, and distributing the letters, pouching them, and forwarding them to their destination. The work goes on day and night, crew succeeding crew; the labor is immense and well-nigh incessant. The smallest error in handling tens of thousands of pieces of mail matter is at once detected; time lost through sickness or other unavoidable causes is deducted from salaries, small as they are; the amount of vacation allowed each clerk per annum is rarely more than one week; and the men are required to work on Sunday.

Under these circumstances the clerks in nearly all the first-class offices throughout the country have organized to improve their position, and with this end in view have caused a bill to be prepared which has already passed its second reading in Congress, and now goes to the Committee on Post-offices for their action. This bill has received the cordial endorsement of prominent citizens of all parties, the Post-office Department itself is in favor of it, and it is to be hoped that the underpaid and overworked clerks will receive that tardy justice they so fully deserve. D. STERITT GITTINGS.

BALTIMORE, January 30, 1888.

OCCUPATION FOR THE BLIND.

TO THE EDITOR OF THE NATION:

SIR: An amusing confirmation of the truth of Mr. Edward B. Perry's recent articles in the

Century upon the blind, and the prevailing ignorance of their peculiar requirements, comes to us in the shape of a widely circulated press report of a wonderful game of draw poker played not long since, in an Eastern city, by a quartet of afflicted gentlemen having a specially prepared deck of cards of three times the usual thickness, with surfaces deeply engraved to meet the exigencies of the occasion. Absurd! Such a deck would be not only a ridiculously clumsy contrivance, but one wholly unnecessary, since—thanks to M. Braille—ordinary playing-cards are just as available to the blind as to any other class. Inmates of the Perkins Institute, Boston, have used for a long time cards bearing the initial letters of the various suits, with figures denoting each card's denomination; and here in the West the system has been still further simplified by dispensing with suit initials altogether, the suits being designated by the location of the figure punctured upon each card's lower margin—hearts, left corner; diamonds, left centre; clubs, right corner; and spades, right centre. By marking the lower margin instead of the upper, as in the older method, a card may be recognized by a simple glance of the thumb, as it were, and a whist hand arranged with gratifying celerity.

The recreation of card-playing is doubtless of too trivial a nature to engage for a moment Mr. Perry's attention, but those less independent in character and fortune than he — to whom a gallop on horseback and a European tour appear equally impossible of achievement —naturally view the matter from a different standpoint, and to such the game of chess has proved a source of even greater enjoyment. The notation of moves is readily mastered, and the beginner, having a kind and patient friend —and such is seldom wanting—to assist him in the development of his experimental games, soon finds the way to be quite easy and the pursuit most fascinating. One amateur, claiming a memory rather below than above the average, has even conducted three simultaneous games to a successful, though by no means triumphant, conclusion.

Finally, the type-writer, through whose good offices this communication is made, must not be dismissed without honorable mention. It is not in the least exclusive; it is as easy of access to the blind as to any who see fit to approach it; and, certain trifling formalities having been duly observed, stands ready and willing to serve one and all with impartial zeal and effectiveness. H. S. Moore.

Muscatine, Iowa, January 24, 1888.

WHAT IS AN "ENGLISHMAN"?

To the Editor of The Nation:

Sir: Will you or some of your readers kindly inform me in what sense the word "Englishman" is generally used in the United States?

I am a native of Scotland, but, having lost my brogue through early education in England, I am not easily recognizable as such. I have travelled a good deal, and in speaking to natives of the various countries in which I have been, I have usually, for convenience' sake, described myself as an Englishman, meaning by this a native of the United Kingdom, unless I had occasion to emphasize the facts of my Scottish descent and birth. I do the same in the United States, but I have found that several of my friends have disputed my use of the word in question, saying that I had no right to call myself an Englishman, since I was in reality a Scotchman. Others again, I found, spoke of Canadians as Englishmen, an application of the word which is often much resented by natives of the mother country.

Of course there can be no doubt that technically "Englishman" means "a native of England, *i. e.*, of the southern part of Great Britain." But it seems to me that the word is so commonly employed in the sense of "native of the United Kingdom" that this use cannot be considered as incorrect, especially as "Briton" has passed into the regions of poetry and oratory, and "Britisher," incorrect in form and ugly in appearance, has not taken root in England or America, and as a word for the purpose is wanted.

But I hold that "Englishman" should only be applied to natives of the United Kingdom itself, though Irishmen (small blame to them) in most cases prefer to keep their own national name. If Canadians are English because they are born in a British colony, where are we to stop? Australians, French Canadians, Maltese, Hindus, West Indian negroes, Kafirs, Hottentots, Fijians must all be English. My American friends say, "Well, they *are* as much English as you are." I say, "No; they are fellow-subjects with me of Queen Victoria, fellow-citizens of the British Empire; but they are not English. I call myself English, not from want of patriotism (Scotchmen don't often suffer from lack of that good quality), but because the word is very convenient, and this use of it is quite general."

As I am of a peaceable disposition, and wish to avoid discussions which occasionally become rather heated, I venture to ask you, sir, what you consider to be the general meaning of the word "Englishman" in the United States, so that I may shape my conduct accordingly.

Yours truly, Adam Craig.

Colorado Springs, January 10, 1888.

[We should think that a Scotchman like Mr. Craig might with perfect propriety call himself an Englishman on the European Continent, or in any place where the habit prevails of looking at and thinking of all natives of the United Kingdom as Englishmen, and people could not distinguish a Scotchman of the better class from an Englishman, Welshman, or Irishman, either by speech or appearance. In the United States or any of the British colonies, however, in which both Englishmen and Scotchmen abound, and in which people are very familiar with their differences of character and accent and traditions, we think the wiser course would be to call himself a Scotchman on all occasions in which there is any obligation to speak of his nativity at all, and especially occasions on which his company expresses opinions about Scotchmen which he does not share, and which they would not knowingly utter in a Scotchman's presence. In brief, it is always wise not to allow any one to assume that you are something which you are not, if the assumption is likely in any way to affect his conduct towards you, or his conversation with you, or his relations of any kind with you.—Ed. Nation.]

COEDUCATION AGAIN.

To the Editor of The Nation:

Sir: If coeducation is to stand or fall by statistics, we hope the following will avert its doom for a few years at least. They show the number of students attending the fourteen leading colleges open to women as represented in the Association of Collegiate Alumnæ. They include also the attendance at Bryn Mawr, which has as yet no alumnæ:

	1874.				January, 1888.			
			Per Ct.				Per Ct.	
	Men.	Women.	Men.	Women.	Men.	Women.	Men.	Women.
Boston	36	16	69	31	70	106	40	60
California	169	22	88	12	‡242	‡46	84	16
Cornell	436	32	93	7	918	104	90	10
Kansas	*49	*31	61	39	‡146	‡70	68	32
Mass. Ins. Tech.	†175	†22	89	11	694	25	97	3

	1874. Women.	Jan., 1888. Women.
Bryn Mawr	....	79
Smith	‖ 17	367
Vassar	265	283
Wellesley	‖ 314	620
Total	596	1349

Attention is called to the following facts:

(1.) In every one of the coeducational colleges, the number of women in attendance is greater than in 1874.

(2.) The number of women attending coeducational colleges has doubled since 1874.

(3.) In the above statistics, no enumeration is made in coeducational colleges of students connected with preparatory departments, or with colleges of music or of fine arts. The statistics given for separate colleges for women *include* all such students.

(4.) In four coeducational colleges it was necessary to give the statistics for 1887. Judging by the increase of previous years, the number of women in attendance at such colleges in January, 1888, is greater than that represented by the table.

(5.) The conclusion of the whole matter is, that about the same number of women are attending coeducational and separate colleges for women.—Respectfully, M.

February 4, 1888.

A SWISS VIEW OF A SURPLUS.

To the Editor of The Nation:

Sir: To-day, while reading Dubs's 'Das Oeffentliche Recht der Schweizerischen Eidgenossenschaft' (Part 2, Zurich, 1878), I came upon a passage which I translate as follows:

"The chief point [in finance] is order, and with it self-control; where these fail, begin corruption, stealing, and vices of every sort; and even in fruitful lands we find continual want, yes, want of bread. But too abundant sources of state support are by no means always an advantage to a country. North America would never have fallen into such bad social conditions as are to be found, particularly in the great cities, but for the immense public domain of which it has the disposition. Indeed, on our own soil, in Switzerland, we find examples enough of the fact that great revenues are not always a good thing for their possessors. Our confederation would hardly be in financial distress just now, if the Eldorado of its tariff duties had not directed it in the road of over-expenditure. Never give a state more than is absolutely necessary for its existence, for you are fattening a monster. . . .

"We affirm that every penny that is taken from the country without necessity, in order to pay it to the state, somewhere in the country makes somebody's piece of bread smaller. We have no confidence in patriotic tax-inventions."

Yours respectfully, H.

Cambridge, January 31, 1888.

* 1877. † 1879. ‡ 1887. ‖ 1875.

Notes.

J. B. Lippincott Co. will issue on March 1, in connection with the Edinburgh publishers, the first volume of a new edition of 'Chambers's Encyclopædia,' to be completed in ten volumes following one another at short intervals. The maps will be increased in number, and a special set for the United States introduced; the illustrations will be largely renewed, with the aid of photography. Articles written in this country are marked "Copyright."

A 'Life of Thomas Hopkins Gallaudet,' founder of deaf-mute instruction in America, is about to be handsomely brought out by Henry Holt & Co.

Charles Scribner's Sons announce for early publication Mrs. Frances Hodgson Burnett's 'Sara Crewe,' uniform in style with the author's 'Little Lord Fauntleroy'; a new novel by George W. Cable, entitled 'Bonaventure: A Prose Pastoral of Acadian Louisiana'; and 'The Tailor-made Girl,' by Philip H. Welch, with full-page illustrations by C. Jay Taylor.

Harper & Bros. publish directly the fifth volume of Kinglake's 'Invasion of the Crimea'; 'Monarchs I have Met' by W. Beatty Kingston; and a pamphlet for the times called 'Tariff and Revenue Discussed,' containing the President's recent message and Blaine's counter message, and the articles by Henry Watterson and Senator Edmunds in the last two numbers of *Harper's Monthly*. A wide circulation of these documents in juxtaposition is much to be desired.

A noticeable number of fresh ventures in periodical literature lie upon our table. We name first the monthly *Our Day*, "A Record and Review of Current Reform," edited in Boston by Mr. Joseph Cook, with the assistance of Miss Frances E. Willard (Temperance department), Prof. E. J. James (Labor Reform), Prof. L. T. Townsend (Education), Anthony Comstock (Prevention of Vice), Rev. C. S. Eby (Missions), and Rev. G. F. Pentecost (Church Work). Five of this staff of writers contribute to the January number. Some of the leading articles are "Shall Utah be Made a Mormon State?" "The Prospects of Prohibition" (by Neal Dow), "Woman as Preacher," "Indictable Art," "The National Divorce Reform League" (Rev. S. W. Dike). The magazine is attractively printed. The *American Anthropologist* is a quarterly publication of the Anthropological Society of Washington, in continuation of their "Transactions." The January number has papers on "The Law of Malthus," by President Welling of Columbian University; "The Development of Time-Keeping in Greece and Rome," by F. A. Seely; "Anthropological Notes on the Human Hand," by Dr. Frank Baker; and "The Chane-abal Tribe and Dialect of Chiapas," by Dr. D. G. Brinton. Mr. Thomas Hampson is the publisher. The *Teacher*, a monthly educational magazine in the quarto form, comes to us from this city. It looks for its support mainly to the female teachers in the common schools, the editors being themselves of that class. "Its hope is the advancement of pedagogy in all its departments." We hope, therefore, that it will lend a hand to the movement for the higher education of women in New York. It is published at No. 1157 Broadway. *Italia* is the title of a monthly magazine published in English at Rome (New York: International News Co.). Its aim is to spread a knowledge of the current of modern life in literature, politics, economy, art, music, etc. A biographical sketch of the statesman Giovanni Lanza, who died in 1882, leads the table of contents for January. Fiction has a place in the scheme. Finally, we speak of the unseen when we mention the *Children's Illustrated Magazine* started last month by Seeley & Co., London. Two full-page designs in colors will be a standing feature.

In another column we have said our say about President Eliot's Harvard report. On the two topics of science preparation and English preparation, useful commentaries (direct and indirect) will be found in the Syracuse *Academy* for February. We refer to the articles, "How to do Laboratory Work in Chemistry and Physics in High Schools," by Mr. James H. Shepard; "Teaching English Literature," by Miss Anna C. Brackett; and "College Requirements in English," by Mr. W. C. Collar. We are very glad to place on our shelves the bound second volume of this magazine—the highest attainment in practical pedagogic journalism yet made in this country.

Some sickening examples of the way in which Jared Sparks tampered with the text of Washington's private letters are given by Mr. William Henry Smith in the February (or Washington) number of the *Magazine of American History*. He afterwards prints with literal faithfulness several of the letters thus mutilated, and fourteen which Mr. Sparks omitted altogether. They all bear date of 1758, and are addressed to Col. Bouquet. The originals are in the British Museum.

Ought imaginative works to be illustrated; and, if yes, by their authors when capable? This is the burden of a symposium or conversation on book illustration devised by the editor for the January *Portfolio* (Macmillan). We cannot think Mr. Hamerton more successful than commonly happens in such dramatic characterizations. Nevertheless what the poet, scientist, artist, and critic (Mr. Hamerton himself, by confession) have to say is very instructive. In the critic's estimation, Rossetti did wisely to refrain from illustrating his own compositions, whereas "Thackeray's illustrations have a great interest, but it is only psychological. His books, with all their satire, are kindlier in their views of human nature than his drawings," which are very defective. Ruskin "is an artist when he writes, a student when he draws. In writing he unhesitatingly sacrifices accuracy to effect, and that is quite characteristic of an artist." In drawing, just the reverse. "Victor Hugo's drawings are violent," "a savage utterance, partly made in fun, like the thumping on the piano of some vigorous but uncultivated amateur." There is in them "a sort of grim humor and a real turn for the grotesque." The *Portfolio* opens the new year well, offering a fine etching after Millais's portrait of the painter Hook, and one not less admirable by Mlle. Poynot after Henner's "Une Créole."

L'Art for January 1 (Macmillan) is, as usual, largely given up to notices of illustrated holiday publications, with samples of the plates. Its sole article is on the late Gustave Guillaumet, from whose drawings many pleasing and effective selections are made. The etching is after A. Brouillet's "Une Leçon clinique à la Salpétrière."

A portrait of Whittier at the age of eighty that is true to feature and to character without being senile—such is the life-size lithographic print issued by Houghton, Mifflin & Co. So remote from the still genial face is the feeling of weakness or decay, that one could fancy the firm lip just closed from repeating some stern poet-prophet message, like

> "The bolts which shattered Shinar's tower
> Hang, smoking, for a fiercer fall!"

The Maimonides Library of this city, whose collection is now close upon 30,000 volumes, makes an appeal for contributions of every sort of document illustrating the history of the Jews in America.

No. 26 of the Harvard Library, "Bibliographical Contributions," catalogues the Carlyle collection of books relating to Cromwell and Frederick II., bequeathed by their former owner to this depository. Mr. William Coolidge Lane is the compiler.

Mr. Ford's 'Bibliotheca Hamiltoniana' has been seconded by Mr. Hamilton Bullock Tompkins with a 'Bibliotheca Jeffersoniana,' published by the same firm (Messrs. Putnam) in uniform size and typography, and also in a limited edition. It is a thoroughly well executed piece of work, and much to be prized. The most interesting of the three hundred odd entries is, of course, bibliographically speaking, the 'Notes on Virginia,' of which from twenty to thirty issues and editions are recorded, one being in French and another in German. On the whole, the number of French translations is smaller than might have been expected. There is one of the 'Manual' and one of the first inaugural address, besides Conseil's 'Mélanges Politiques et Philosophiques.' Three Italian translations are mentioned. Only the more important messages have been taken note of by Mr. Tompkins. A complete set, he tells us, has not existed since the burning of the Capitol in 1814.

Mr. S. S. Rider, in his Providence *Book Notes* for February 4, supplies a title overlooked by Mr. Tompkins, viz., Sears's 'American Politician,' 1842, containing a memoir of Jefferson, his inaugural and first message. In the same number it is demonstrated that no woman was ever hanged for witchcraft in Rhode Island, nor were there any proceedings under the statute imposing the penalty of death for that offence.

A writer in a recent number of the *Kölnische Zeitung* gives an interesting account of the newspaper museum at Aix-la-Chapelle, founded by Oscar von Forckenbeck. It now contains files or specimens of over 17,000 different papers, nearly half of the newspaper press of the world, and is receiving daily additions from every part of the globe. Dr. Wilhelm Joest, the author of a work on the German press in other than European countries, has recently sent to it his collection of 1,200 papers, making it more complete in this department than in that of papers published in Germany. The great curiosity of the Museum, framed and hung upon the wall, is No. 46 of the *Texas Democrat*, published at Houston March 11, 1864, and printed on wall paper.

The January number of *Petermann's Mitteilungen* opens with an account by Graf Pfeil of a recent journey through Useguha on the east coast of Africa. Though chiefly devoted to descriptions of the soil and geological observations, it contains some interesting notices of the natives and their customs. A detailed description is also given of a wooden musical instrument, very similar to our xylophone, together with the notes of a melody ordinarily played upon it. This paper is accompanied by a map, as is also Dr. Lange's notice of two river systems in southern Brazil.

Dr. Guido F. Verbeck of Tokio, Japan, the American missionary whom the Mikado's Government placed at the head of their educational system immediately after the civil war of 1868-69, has published his 'Conspectus of the Japanese Verb in all its Conjugations.' In this excellent aid to the mastery of the Japanese language, notwithstanding its brevity and compactness, in ninety-five pages, this scholar has

presented to the eye the substance of many native grammars and dictionaries.

The *Nation* of August 18, 1887, contained an account of the excavations which had been conducted on the site of the ancient Greek city of Sicyon by the American School of Classical Studies at Athens. These excavations were resumed in the autumn, and work there has only recently ceased for the winter. The orchestra and its entrances have been cleared of the layer of earth which covered them. The new finds have not been numerous, but are of considerable importance. The chief is the head of a statue of Parian marble, of good Greek workmanship, about life-size. It was broken into three pieces, but the face is uninjured, with the exception of the nose and one brow slightly marred. It is pronounced to be a Dionysus with extreme feminine traits. A torso was found to which this head may prove to have belonged. Another head was brought out from some retreat by a peasant, and removed to Athens by the Government. A large head of mediocre workmanship was also found in the excavations. These are valuable as the only known specimens of Sicyon art.

Dr. Sigmund Fraenkel, a pupil of Prof. Theodor Nöldeke, has done valuable service for Semitic lexicography by separating from the Arabic lexicon the words of Aramean origin ('Die Aramäischen Fremdwörter in Arabischen,' Leyden: E. J. Brill), and he has in turn discussed the origin of these words, quite a number of which are derived from Persian and Greek. From its arrangement, as well as from its material, the work has an interest for other than lexicographical students. Dr. Fraenkel has disposed the words treated into groups, like house, food, clothing, and ornaments; animals, agriculture, minerals, names of wines and their receptacles; seamanship, military, writing, artisanship, and trade; Christian religion, statesmanship, etc. The student of history can see at a glance how valuable such a work may become for him, enabling him to separate the indigenous from the foreign both in church and state, in literature, and in the family.

We have received two parts, going as far as *fromm*, of the fourth improved edition of F. Kluge's 'Etymologisches Wörterbuch der Deutschen Sprache' (Strassburg: Trübner). We gave a full notice of the first edition in January, 1884. Since then the book has been criticised for its brevity and conciseness, but the author is to be congratulated on not having yielded to the temptation of enlarging it. It is a matter of surprise to us that this work has not been translated into English.

The new edition of 'La France Protestante,' the great biographical and bibliographical dictionary of the French Protestants, has reached the sixth volume, the first half of which, completing the letter F, has just been published. The most noteworthy articles are those on the Estiennes and Farel. It also contains a much fuller list of "forçats pour la foi" than the first editors were able to print.

M. Eugène Réveillaud, the author of a history of Canada and the French Canadians, has discovered in the archives of the department of Seine-et-Oise a manuscript 'Histoire Chronologique de la Nouvelle France,' from 1504 to 1632. The author, a Récollet father, Sixte Le Tac, relates with much vivacity the attempts of the Jesuits to become sole masters of Canada. M. Réveillaud is about to publish the work with notes and documents. The subscription price is announced at ten francs, to be raised to twenty after publication.

In anticipation of the celebration of the centenary of the French Revolution, the Minister of Public Instruction has ordered the collection of material for a 'Histoire Impartiale de la Révolution.' According to a circular recently issued, this is to be grouped under these general heads: "État des personnes (Clergé, Noblesse, Tiers-État); État des terres, Administration (Administration générale, Finances, Justice, État militaire et maritime, Instruction, Beaux Arts); Agriculture (Industrie, Commerce)."

An eminent American instructor writes us as follows: "During the past fortnight, I paid about 30 per cent. duty on one package of books, while duty must have been charged on pamphlets of 40 or 50 pages in two other packages, unless the duty charged was excessive. Some of these were new publications which I desired for immediate use in my professional work, in teaching and in research, and I was more troubled by the delay in the Custom-house than by the 'duty.'"

—The February *Century* is a most excellent number. The Seward-Lincoln correspondence, which has been widely noticed, is a genuine surprise. There could not be more conclusive evidence of the little estimation in which Lincoln was held, when he took office, by the head of his party in the East. The act itself, the scarcely veiled suggestion that Lincoln should resign his functions into the hands of his Secretary of State, is sufficiently remarkable; but the policy Seward foreshadowed, with its two foreign wars, shows how far the would-be prime minister was from having a true sense of the country's situation, and it is a dreadful blow to Seward's reputation for statesmanship that he harbored at all such impossible ideas. He did not understand Lincoln's Fabian mind, which waited until all sides had been heard and all projects discussed before he came to the decision; but this lack of acquaintance with the President's character was excusable, while his own failure to penetrate the internal situation, and his wildness of aim in thinking to fight Spain and France, with Virginia on the point of secession, is a marvel of error. The Chicago Convention had builded better than it knew in placing Lincoln at the head of the ticket. The second article of greatest interest is the Landor correspondence with Miss Boyle, which is of value rather because letters of this kind are rare in our literature than intrinsically. Mr. Lowell's critical introduction is only too brief, and, interesting as is his portraiture of Landor in his old age, one wishes he had had more to say, especially of Landor's poems. Mr. Lowell seems to be thinking of him almost entirely as a prose author. The Russian papers of Mr. Kennan continue to be admirable, and in this instalment the jealously closed secret of the Petropavlovsk fortress has enough light shed on it to make one hope that the fate of the Bastille will yet overtake it. Other articles upon the history of stage-setting, ranch-life on the plains, Paris, and especially the comprehensive contribution of Gen. Sherman on the general military science of the war, are well worth more extended notice than we can give them. The weakness of the number is in its poetry, and of such a performance as Mr. Maurice Thompson's, which is a kind of Nat Willis rendering of Walt Whitman, it is difficult to say whether there is more decomposition of sense or of poetic art in it. It almost rivals Will Carlton's great effort in the Christmas *Harper's*.

—The latest publication of the Shelley Society, a type-facsimile of the 'Epipsychidion,' 1821, contains an admirable preface by Rev. Stopford Brooke, which may be profitably brought into connection with Arnold's recent essay, in which he endeavors to sensualize Shelley in all his relations to women as a man of an "entirely human inflammability." This is a gross view and grossly put, and it is especially unjust to confuse Shelley's idealizing temperament with sensuality in such a case as his attraction towards Emilia Viviani, who is the figure of the 'Epipsychidion.' This poem is the most difficult of his works, because it contains his theory of love, and is, moreover, a poetic and obscure allegory of his own search for ideal beauty, which he symbolizes by its highest imaginative form—woman. Mr. Brooke does not discuss this theory; but he states it fully and freely. Speaking previously of Shelley's Platonism, he says:

"Hence arose a theory of personal human love which traverses the code of social morals, and that theory Shelley held. It was that to bind ourselves down to one object of love alone was not wise, because then we rendered ourselves incapable of seeing and realizing those different aspects of the ideal Beauty which we could find in other minds, in other personalities. . . . Whether Mary liked that theory, whether it has any rightness in it at all, how far Shelley practised it or refrained from putting it into practice, is not the question now. . . . This is a theory capable of being used to promote licentiousness by those who have the sensual idea of love and beauty. By Shelley, who abhorred sensuality, . . . it could not be used in that manner. But he saw no reason whatever why he should not, while he was faithful to his marriage tie, give deep affection to other women, and find represented in them other phases of the absolute beauty, which phases he was bound to feel and gain through them."

—This represents Shelley, on the philosophic side of his mind, very well, and in writing 'Epipsychidion' that was the side he was expressing. The element of reality in it, so far as Emilia was concerned, is very slight. He used her charm for him, which sprang from her pathetic situation and personal beauty, as Raphael might have seen some models and dreamed a Madonna. In other words, his mood was not one of "inflammability," but of idealization. He was amorous, but so, certainly, was Milton; and to confound warmth of temperament with the soulless pleasure of sensuality is a wrong to our nature. Those who have read Mr. Arnold's essay, which seems to us one to be much regretted, cannot find a better illustration of the way in which Shelley thought and felt about love, and made it a mystical element in his poetry and an ideal worship in his life, than this preface, which contains much sound and temperate criticism of Shelley's modes of expression, both in their weakness and in their surprise. To the essay are added the fragment "On Love" and the beautiful "Una Favola," which is an earlier prose 'Epipsychidion' with Emilia left out.

—The forty-sixth birthday of Sidney Lanier, the Southern poet and musician, was celebrated in Baltimore on February 3 by a company of his personal friends and associates. It is nearly seven years since he died, and his fame appears to be constantly increasing as the ideal of his aspirations is more clearly discerned. He has never been a "popular" poet—perhaps he never will be. To some minds he appears obscure; to some he seems like a poet of another age discoursing on modern themes; to others—and this number is growing—he seems a poet of the future, the herald of better things to come from the pens of those who are inspired by the ideas that animated him. Whatever may be his ultimate position, the celebration in Baltimore shows that his life and writings have already made a strong impression on a large number of gifted and earnest minds. The immediate occasion of the assembly was the presenta-

tion of a likeness of the poet to the Johns Hopkins University. The sculptor, Ephraim Keyser, now at work on the Arthur monument, modelled the bust during Lanier's life, and caused it to be cast in bronze. When a kinsman of the poet, Mr. Charles Lanier of New York, heard of the existence of this work of art, he generously gave it to the University in which Lanier had been a lecturer. A citizen of Baltimore offered the pedestal. To receive the gift, a company of perhaps one hundred and fifty persons assembled in the hall where the poet had read his lectures on the Growth of the Novel, English Literature, and on the Science of Verse. There stood the bust crowned with laurel; on the pedestal hung his flute; at the base was a bed of flowers. Musicians representing the Peabody Orchestra, in which for years Lanier had played the flute, took part in the exercises. One of his musical compositions, adapted to words of Tennyson's, and one of his own poems, which a friend had set to music, were sung. Miss Ward, sister of Lanier's biographer, read selections from his poems. Father Tabb, a Catholic priest who had shared with Lanier the privations of prison life during the civil war, read a sonnet in commemoration of his friend; another sonnet came from Richard E. Burton of Connecticut, and longer poems from Mrs. Turnbull of Baltimore and Joseph Cummings of Tennessee. Just before the hour of the meeting, the mail brought some exquisite lines from Miss Edith M. Thomas, which, like the poems already mentioned, were read aloud. Professor Tolman of Ripon College, once a pupil of Lanier's, contributed a critical estimate of his 'Science of Verse,' and Mr. Burton prepared a list of printed articles and poems, some thirty in number, which have appeared since Lanier's death, many of them by writers of distinction. President Gates of Rutgers College spoke in words of affectionate admiration of the ethical influence of Lanier's character and life. Many interesting letters were received, and three of them, those of Lowell, Richard W. Gilder, and Edmund C. Stedman, were read. Finally, as a choice memento of the hour, a card, designed and given by Mrs. Whitman of Boston, was offered to every one of the company. Upon one side of the card were a wreath of laurels, the name and date, and the words "Aspiro dum exspiro," and on the other side the lines with which Lanier closed his hymn to the Sun, in the first of the "Hymns of the Marshes":

"Ever by day shall my spirit, as one that hath tried thee,
Labor at leisure, in art; till yonder, beside thee
My soul shall float, friend Sun;
The day being done."

—The Wisconsin State Historical Society is well-nigh coeval with the State. It has just held its thirty-fifth annual meeting, and the State lacks some months of being forty years old. The Society has no rival west of the Alleghanies. Its library numbers 60,722 bound volumes, and its pamphlet collection some thousands larger—a total of 123,449. The seventh volume of its catalogue has just been published, and the tenth and eleventh octavos of its historical collections are now in the press. Its volumes of Shaksperiana are 885, those on the War of the Rebellion 1,617, newspaper files 5,240. A class catalogue has been published of works on the Rebellion. The art-gallery contains 149 portraits of men who have figured in State history. The Indian relics and stone tools are numerous, and the magazine of copper implements is nowhere surpassed, or surpassed only in Buda-Pesth. Among the manuscript treasures are autographs of every one of the fifty-six signers of the Declaration of Independence, and something more than a signature in the handwriting of almost all of them. The historical gatherings are garnered up in a wing of the State Capitol which was built a few years ago to contain them. This building was considered to be fire-proof, as well as to afford ample room and verge enough for the accumulations of ages. It now appears, however, that in fifteen years the Society will be crowded, and must say: "The place is too strait for me; give place to me, that I may dwell." For this reason, and still more in order to enshrine such historic jewels as cannot be duplicated where the assurance that they cannot be burned will be doubly sure, the Wisconsin historiophilists are impatient to obtain, through munificence private or public, new and larger quarters in an edifice isolated and incombustible. Their past successes encourage the hope that their will will have its way. Alexander Mitchell, the Milwaukee banker and railroad president, who died last April, was for some time President of the Historical Society. Hence a memorial address concerning him was delivered at the annual meeting. The speaker, Prof. James D. Butler, confined himself to Mr. Mitchell's financial career. Imported from Scotland as a clerk in a so-called insurance company, Mr. Mitchell turned it into a bank, and the only one for thirteen years in a State twice as large as Scotland and growing faster than any of our States has ever grown. He became the foremost banker in the Northwest, and then was for more than twenty years conspicuous among railroad kings. The railroad fragments which, when he took hold of them, were less than 400 miles long, he expanded so as to leave them with a length of more than 5,000 miles. No man has moulded Wisconsin history with a more potent hand.

—In 1879, Dr. Grímur Thomsen of Bessestad, himself a poet, whose lyrics, though not numerous, are of a high order, began to make the necessary collections for a memorial edition of the poetical works of the Icelandic hymnologist, Hallgrímur Pétersson. The task proved no easy one, for not only were some of the editions of the poet's verse, running back through two centuries, very rare, but many productions bearing his name, yet of more or less doubtful authenticity, were in existence, demanding a good deal of careful sifting before the table of contents of the proposed collection could be made out. There were variations, too, of some importance in the printed texts of the religious verse, especially in the issues of an early date, and others in the few manuscripts to be found in the Icelandic libraries. As for the non-religious verse, no real attempt had been made to gather it together, much less to edit it. The long labors of Dr. Thomsen have now resulted in the appearance, a few months since, of the first volume of 'Sálmar og Kvædi eftir Hallgrím Pétursson,' a very handsome specimen of Icelandic typography—the presses of Reykjavík being, in fact, not at all inferior, in the quality of their work, to those of far larger European capitals. An engraved portrait of the poet, in his stiffly fluted Lutheran ruff, forms the frontispiece. The volume comprises the fifty 'Hymns on the Passion' (*Passíu-sálmar*)—the one great poetic classic of the modern literature; the versified paraphrase of the first book of Samuel, and a fragment of the second (Samúels-sálmar); and the 'Spiritual Chain' (*Andleg- Kedja*), or verselets based on the Gospels, which is ascribed by Dr. Thomsen to the pen of Hallgrímur, mainly on internal evidence. The book ends with some pages of notes, among them being a bibliography of the 'Passion Hymns' more complete than any yet compiled. It enumerates thirty-six editions, beginning with the first (issued at Hólar in 1666), or, including the present one, thirty-seven—an average of a new edition every six years. Dr. Thomsen has prefixed an instructive essay on the life and literary activity of the poet, with an incidental account of early Icelandic hymnology. He shows with what astonishing rapidity the German Reformation and post-Reformation hymns reached the remote island and were turned into the vernacular. Their fire and fervor doubtless awoke the slumbering memories of the previous Skaldic ages, for they speedily found not only translators, but imitators, and the whole land burst out in a chorus of hymns, the echoes of which are still heard; sacred verse forming a disproportionately large part of the new literature. No other of the religious bards has reached the eminence of Hallgrímur Péturssson, but many have been remarkable in their way, turning not alone the books of the Bible, but popular collections of sermons, or meditations, or prayers, into series of hymns. The second volume of Dr. Thomsen's edition, now printing, is to contain the remaining hymns of the author, and his secular verse—much of which, singularly enough, is broadly humorous, but showing often a marvellous metrical ingenuity. This will still leave material enough for a supplementary third volume, to contain his *rímur* (tales in verse), and his religious prose (chiefly prayers and meditations).

FROUDE'S WEST INDIES.

The English in the West Indies; or, the Bow of Ulysses. By James Anthony Froude. Charles Scribner's Sons.

THE value of a book will always be determined mainly by the author's purpose in writing it. It may have no value even if the author's purpose is well settled in his own mind, because he may be a bungler in his art. But even if he is not a bungler, his work will be bad if he is overmastered by something quite different from the task he has set out to do and really thinks he is doing. The central idea of Mr. Froude's work on the West Indies is that England ought not to grant home rule to Ireland. This is the beginning, the middle, and the end of it. All that he tells us about the West Indies is scaffolding for an argument on the Irish question. He takes his departure from London with the Gladstonian jargon ringing in his ears. He escapes it until he reaches the islands, although the remembrance of it sadly mars the pleasure of the journey by sea. When he finds himself in West Indian waters, the greatness of Rodney and the contrasted littleness of Gladstone, and indeed of all English Parliamentary orators who have ever lived, with the possible exception of Chatham, who was essentially a man of war, come over him with new force. At Jamaica he gets his first mails from home. Of course they are filled with the everlasting Irish question, and so we have the whole thing over again. We do not intend to follow Mr. Froude's Irish debates. As critics of his West Indian observations, we neither approve nor disapprove his positions regarding home rule, but we present one paragraph from his musings in the island of Jamaica. *Ex uno disce omnes:*

"Mr. Sexton says that if England means to govern Ireland, she must keep as large an army there as she keeps in India. England could govern Ireland in perfect peace without an army at all, if there was no faction in the House of Commons. Either party government will destroy the British empire, or the British nation will make an end of party government on its present lines. There are sounds in the air like the cracking of the ice in the Neva at the in-

coming of spring, as if a nobler spirit was at last awaking in us. In a few more years there may be no more Radicals and no more Conservatives, and the nation will be all in all."

Holding such decided views on the subject of home rule in Ireland, Mr. Froude must necessarily take a very dark view of home rule in the West Indies—if there were any such thing. A simulacrum of it existed for a while in Jamaica, until Governor Eyre put an end to it by shooting and hanging a lot of "niggers." The account which Mr. Froude gives of this deplorable affair, even if no other account were accessible, would convince an impartial reader that the massacre was brutal and unnecessary, the work of a weak-minded man, acting under the influence of the white inhabitants who were under the momentary influence of panic; and that the execution of Gordon, the colored orator and member of the Jamaican Assembly, was a cold-blooded executive murder. Mr. Froude drops a tear over the grave of poor Gordon, while sitting in his (Gordon's) lovely garden; but his sympathies are mainly with poor Eyre, who was dismissed from office after an investigation by the Home Government. Poor Eyre was completely "ruined" by this sad affair, although no man ever shed his brother-in-law's blood more conscientiously (Mr. Froude, in his sentimental moments, always speaks of the West Indian African as our "brother-in-law").

Mr. Froude's book has a political purpose throughout, viz., to put on the brakes and stop the train that is rushing towards "dismemberment of the empire." We must have no such nonsense as home rule in the West Indies. But we defy anybody to tell from reading this volume what is the present government of the English West Indies, or any one of them. The fact is, that those governments are exactly such as Mr. Froude extols and commends as best suited to all the non-English colonies of Great Britain. They are Crown colonies, whose political existence depends upon an earthly providence sitting in Downing Street. The nearest approach to self-government is found in the island of Barbadoes, where there are 4,000 electors to 175,000 inhabitants, the tests of the suffrage being partly those of property and partly educational. Mr. Froude unconsciously testifies to the tranquil and orderly and comparatively prosperous state of Barbadoes. The island is overpopulated (more than 1,000 to the square mile). It is hard to fill so many mouths from the produce of so small a patch, but it would be harder still to find any purely Downing Street colony that is doing so well.

The case being admittedly bad in the islands generally, so bad that Mr. Froude can hardly find words for his indignation over the net result, we are moved to ask, "What is the matter? The islands do not have home rule, and apparently do not want it. They have their earthly providence—their Ulysses always stringing his bow in Downing Street—why do they not get on?" There are two reasons, according to Mr. Froude. One is, that the trustee in Downing Street does not take an interest in his *cestuis que trust*. The other is that the islands were not allowed to have a reciprocity treaty with the United States, whereby the price of sugar might have been raised by its free admission into its greatest market. If England would only gird herself up and do her duty and take an interest—if she would "make an effort," like Mrs. Dombey, or "be a man," like Mr. Chuffey, we should see an improvement very soon. Why do not young Englishmen go to the West Indies and make their fortunes? asks Mr. Froude again and again. Here is land and labor and climate and richness all inviting the ingenuous and sturdy youth of Albion to go and make their homes. Alas, they are deterred by the apprehensions of home rule and negro supremacy! And the enterprising Yankee is deterred by the same fear. Give us the assurance that we shall have none of this, and we shall straightway begin to take an interest and make an effort and be a man. Let Downing Street, or rather let all England, come up and take a solemn oath to wage eternal war against home rule. Nothing short of this will ever restore the Antilles to their former prosperity and Britain to her pristine glory.

The amount of misinformation in Mr. Froude's book concerning things that he saw with his own eyes is extraordinary. He says, for instance (p. 50), that the blacks in the islands are "perfectly happy." "They have no aspirations to make them restless. They have no guilt upon their consciences. They have food for the picking up." A people who have food for the picking up are, of course, in an enviable state, seeing how great a struggle mankind generally have to get a sufficiency. We are considerably surprised, therefore, to read a little further on (p. 109), that if Barbadoes is driven into bankruptcy (by the failure of the American reciprocity treaty), and wages cease, "the negroes will starve and will not take their starvation patiently." Why should they starve when food can be had for the picking up? Why should they work for wages at all in such a land of plenty? The truth is, that the West Indian negro seldom has enough to eat. His wages are only twenty cents a day, and he has to buy food imported from the United States and reaching him with freight charges and heavy import duties added to the American price. Let anybody take a walk along the roads in any of the islands with the special view of seeing how much food he can gather without paying for it. Then let him leave the road and plunge into a tropical jungle with the same view. His foraging will be just as productive as it would be in Westchester County, New York, or in Warwickshire, England. The plantain, the cheapest food of the tropics, is as much an article of commerce as the cabbage is in the United States. Yams are sold in all the market-places, and it is absurd to suppose that the negroes would buy them out of their scanty earnings if they could be had for the picking up.

Mr. Froude recurs again and again to the injustice done to the islands by disallowing the reciprocity treaty with the United States, although every American and every well-informed Englishman knows that the treaty never had the smallest chance on our side of the bargain. The Mexican Reciprocity Treaty, which was far more favorable to us and far less objectionable to our own sugar planters, remains unconfirmed to this day. The West Indian Treaty, if there had been any such thing, would have been shelved with even less ceremony. But Mr. Froude's indignation becomes hottest when he tells his readers (p. 318) that "the commercial treaty which was offered to our islands by the United States has been accepted eagerly by the Spaniards. *Spanish sugar goes free into the American market.*" This will be news to our customs officers. If it were true, it would spare Congress a world of trouble in dealing with the surplus. Who could have told Mr. Froude that the sugar of Cuba is admitted free of duty into the United States, we cannot imagine. Perhaps it was the same deceiver who told him (p. 340) that "St. Domingo, or Española, of which Hayti is the largest division, was the earliest island discovered by Columbus." Other historians say that it was one of the Bahama group, to which Columbus gave the name of San Salvador.

Mr. Froude draws a dark picture of negro self-government in the republic of Hayti. As this is taken almost wholly from the pages of Sir Spencer St. John, it is probably a true picture. But he says nothing about the adjoining republic of St. Domingo, which is doing as well as some white republics and some British Crown colonies that might be named.

There is a chilling suggestion here and there in Mr. Froude's pages that slavery was not so very wrong, and may even have been beneficial to the blacks, since they were slaves in their own country and were only transferred from a barbarous servitude to a civilized one. This is a characteristic inaccuracy, if not a suppression of the truth; the fact being that man-hunting existed in Africa only because there was a market for slaves outside. But for the white slave-trader, the native slave-hunter would not have been. The same thing is still going on in the Sudan. The slaveholder in the Orient may as easily say that he is doing no wrong because his victims were slaves before he got them.

There have been many books written on the West Indies, but none that we have read is so worthless and untrustworthy as Mr. Froude's. In mere descriptive writing it is surpassed by Kingsley's, and, while not devoid of entertaining qualities, it is inferior to the recent one by Mr. Paton. But Mr. Froude does not write to describe tropical scenery and vegetation, or to while away one's leisure hours. He writes to instruct and educate. He has a deep moral purpose. It is to show how the world has degenerated since the days of Charles V.; how inferior the nineteenth century is to the sixteenth; how the Reformation has gone on levelling and grinding us into an indistinguishable mass—all this in a style which may be called Carlylese in the fifth or fiftieth dilution. We quote a sample from p. 306:

"The sixteenth century was the blossoming time of the Old World, and no such men had appeared since as then came to the front, either in Spain, or Italy, or Germany, or France, or England. The actual leaders of the Reformation had been bred in the system which they destroyed. Puritanism and Calvinism produced men of powerful character, but they were limited and incapable of continuance; and now the liberty which they had demanded had become what their instinct had told them from the first must be the final shape of it, a revolution which would tolerate no inequalities of culture or position, which insisted that no man was better than another, which was to bring down the high till all mankind should stand upon a common level—a level not of baseness or badness, but a level of good-humored, smart, vulgar, and vulgarizing mediocrity, with melodrama for tragedy, with farce for comedy, sounding speech for statesmanlike wisdom; and for a creed, when our fathers thought that we had been made a little lower than the angels, the more modest knowledge that we were only a little higher than the apes."

This was the substance of Mr. Froude's contention in an argument with one Don G——, in the island of Cuba. If Don G—— had been a reader of Dickens, he must have sighed with the elder Turveydrop: "I see nothing to succeed us but a race of weavers."

RECENT NOVELS.

Miss Curtis. A Sketch. By Kate Gannett Wells. Boston: Ticknor & Co.

Mahaly Sawyer. By S. E. D. Boston: Cupples & Hurd.

Major Lawrence, F.L.S. By the Hon. Emily Lawless. Henry Holt & Co.

The Fiddler of Lugau. By the author of 'Mlle. Mori.' Thomas Whittaker.

Wandel der Zeiten. Vier Erzählungen vom Verfasser der 'Erinnerungen eines deutschen Offiziers.' Wiesbaden: J. F. Bergmann; New York: B. Westermann & Co.

It is not essential that a sketch should be also a sermon, but, from its beginning, the reader of 'Miss Curtis' is justified in seeking a lesson through its pages, and may fairly feel disappointed, on laying down the volume, at his inability to decide what the lesson is. It breathes the aroma of mission too aggressively for an amusing book, and glitters with too much brightness for a didactic one. Children, and all persons having charge of children, will do well not to read the opening chapters. A child who "explains herself" at all is to be shunned, still more one who "explains herself by saying that she never knew how far down she should settle, and that when she got to the finality of anything there was little of it; though it was just like the sediment in any other process of thinking—right for right's sake." To the same infant phenomenon "all boys, except the visionary one of the future, were . . . as so many girls," including, it may be supposed, her brother, to whom she thus expounds herself: "With girls it is always couldn't because we have not got so much daring in us; and with boys it is wouldn't because they are set in their ways." One is by this time prepared for the boy's avowal "that he would have nothing more to do with girls; they could not be trusted, they were so emotional." These are capital children to discourage in real life, and to keep out of literature, if unconsciousness and simplicity are good things, and if, as Mr. Fiske tells us, the perfection of the race hinges on the length of its childhood. But what can be expected of children whose mother's ambition for them is that they should "feel the sense of universal relationships before they can understand what those words mean," that it may "prevent them from becoming conventional"; there being "nothing so deadening for children as a perception of conventionality"? Young ladies who are anxious to be popular will be helped by learning, on the same mamma's authority, that that which makes a belle is "the power of circumscribed adaptation; she means a girl adapts herself to small people, not to causes."

The lady who figures in the title rôle is a monster of eccentricity. Serving a sponge-cake baby at a children's Christmas party is not an endearing action, and should have been carefully forgotten if ever done. There is too much that is strained in the book for it to be an effectual protest against morbidness, which one half suspects it is intended to be; the characterizations are too vague to make it a story, too detailed to take refuge under the assumed name of "a sketch." The girl who renounces conventionality becomes a slave to un-convention, and does but change her manacles. The settlement of "the proportions of life, between purpose and hobbies, conventions and freedom," seems on the whole no nearer adjustment for the existence of this book. In style, it is in the tone of repressed epigram, made familiar to the reading world by many little novelists of the past decade. One would say that the best thing to have done with the material would have been to take the clever sayings in which the book abounds and make them into a calendar. One of the best of these is Miss Curtis's stern advice to an over-zealous reformer: "Why don't you leave something to be done in eternity? You will advance morality ahead of chemistry; the world will be perfect long before it is destroyed. Better let the sciences keep pace with each other."

Complaint cannot be made of 'Mahaly Sawyer' that it lacks motive. Though thinly disguised as a story, it is a treatise upon behavior towards servants. It is written in a humane and kindly spirit, and contains in its suggestions much gentleness, much good sense, and occasional flashes of shrewdness. As a story it is on a par with the tales of the late T. S. Arthur, and may be ranked in what has been called the pie and piety school.

To turn to 'Major Lawrence, F.L.S.,' from these books is (so far as construction is concerned) like going to a theatre after witnessing performances by amateur actors. 'Major Lawrence' shows the hand of the expert in novel-writing, which is not to say that it is a cleverer book than 'Miss Curtis,' or that it has as wide a range of topic, or that it is written with any motive beyond that of entertainment. But its well-defined form, its clear and ingenious characterizations, its expressive and elastic English make it, particularly during its first half, a highly readable book. It is true that it is laid out on somewhat conventional lines, comfortably familiar to the omnivorous reader of English novels. The imperious high-bred English dame—a delightful character, too; the reticent John Bull hero, oscillating between his native island and his Indian regiment, with a rather fatiguing persistence which suggests a mileage ticket that must be used up; the self-willed hoyden developing into a Griselda; the fastidious, brutal husband; the slangful brother—all are there, very truepennies of faithful attendance on the British novel-writer's pen, as constant institutions as any others of British soil. Comfortable, kindly acquaintance they are; one is quite sure that they will not forget their parts nor disgrace their management.

It must be confessed that there are too many acts in the drama. Even English landscape, though as pictorially and poetically described as herein, palls a little upon too much repetition. Italian villages and Italian hotels lose their distinctiveness when they crowd too thickly. Griselda, like the figure on the Grecian urn, appears destined to be the immortal bride of quietness while the love story stands still so long; and her lover, like him who ever wooed the immortal bride, threatens too, like him, to tease us out of thought as doth eternity. Two protests must be entered—one, in the name of all novel-lovers against the incomplete ending. After witnessing so much pain and struggle, the reader deserves the cakes and ale of an old-fashioned final tableau. The second protest is against the protraction of scenes of dissolution, mental or physical, such as fill page upon page of this book. Emerson's canon of breakfast-table manners holds good for works of fiction, and should abolish extended discourse of leprosy, sciatica, and thunderstroke. If the stage must be cleared, let it be done without needless delay and detail. But when all is said, this novel, spite of certain obvious weaknesses of plot and prolixities of form, will find many pleased readers for its flowing style, its bright epigram, its agreeable incident and charming conversation, and most of all for that all the world loves a lover.

The 'Fiddler of Lugau' is a pleasing little story, tastefully written, as its authorship insures. The scene is laid for the most part in the Saxon town of Lugau during the early years of the century, affording a striking background for skilfully drawn pictures of life in Germany during the Napoleonic wars. The presence of certain Netherlanders in the place, and that of a few Wends, descendants of the builders of the town—a once proud and powerful race, now few, feeble, and despised, and but ill-assimilated with the German life about them—lend variety to the personages, and furnish complications for the story, while the Saxon hatred of Napoleon, lacking completeness only by reason of another hatred of Prussia, the distant tramp of French troops, the suffering and uncertainty of the times, make a grimly effective setting for a tender little tale of love and loyalty, wherein music is the motive spring. The jealousies and revenges, professional and political, which run side by side, the peals of church chimes, and the eloquence of the violin, the alarms of war, and the home life in the families of Lugau, schoolboy tricks and faithful love, make up the story. Spite of the happy ending, it is a pathetic little history, shadowed by war and by the ever-touching tale of sensitive genius meeting no recognition except from a pair of loyal young hearts. All is told with exquisite refinement. The vividness and charm of the local color make one feel the final change of scene to London and a merchant's household to be something of an anti-climax. One would rather have closed the book on the wooded moor that lay round Lugau, spirit-haunted, or at a Saxon fireside with the grandmother knitting in the corner.

General Hartmann's latest volume of tales is characterized by the same grace and smoothness of style which distinguished those formerly published. The characters and incidents are natural, and are agreeably described, as well as agreeable in themselves, and they have a sort of historical value as illustrating four phases of modern German history—1830, 1848, 1864, and the heyday of Bismarck's glory. Great is Allah, and greater is his Prophet! to wit, the Chancellor—this is the burden of the General's song in the fourth tale, which is rather livelier than the others, having apparently been written for the stage, since the narrative portions are nothing but stage directions. The first of the stories has the same landscape and atmosphere as Mr. Shorthouse's 'Violin' and 'Schoolmaster Mark,' but, singularly enough, the English romancer surpasses the German on the latter's own ground, not only as regards the interest of the story, but in viewing his characters through that dreamy, poetic haze which seems to arise from the soil of Germany alone. Nowhere else is romance able entirely to divest itself of the hard and graceless facts of life or history, while here such dematerialization seems almost involuntary. General Hartmann's tales are quite free from the morbid or artificial sentiment which defaced some of Auerbach's efforts in this direction, but they cannot, we should think, prove very interesting, even in Germany, and must certainly be found dull in proportion to the distance therefrom.

SIR FREDERICK POLLOCK'S REMINISCENCES.

Personal Remembrances of Sir Frederick Pollock. 2 vols. Macmillan & Co. 1887.

The long and glorious career of the English aristocracy is principally due to a cause which is very well illustrated in the history of the Pollock family. The grandfather of Sir Frederick, the author of these memoirs, was a saddler. Although at one time well off, he died poor, partly perhaps in consequence of his having trusted the Prince of Wales (George IV.) to the extent of £3,000. A portion of this debt was eventually paid by the nation, but the saddler had become so much impoverished that he was unable to keep his son at Cambridge, and it was owing to the generosity of Tavel, his tutor at

Trinity College, that the young man completed his course. This son became Chief Baron of the Court of Exchequer; his son, the present writer, held a number of dignified and lucrative positions under the crown; and his son, of the same name, is now Professor of Jurisprudence at Oxford. They all have made contributions to general as well as professional literature. Another of the saddler's sons, Sir George Pollock, became Field-Marshal, and other members of the family have occupied distinguished positions in her Majesty's service. It is in this way that the ruling class in England have perpetuated their power. They have constantly renewed their vigor by contact with the people, and welcomed to their ranks men of whatever birth, provided they were of proved ability.

So far as appears from these volumes, the fact that a man is of a new family does not affect in the slightest degree his position in London society. Sir Frederick appears to have known everybody worth knowing, and to have gone everywhere he wanted to. When a youth, he danced with the Marquis of Huntly, who had danced with Marie Antoinette, and in his old age he pays a hearty compliment to the wife of the present American Minister to the Court of St. James's. The number of distinguished persons that he speaks of dining with, passes all computation. Through the influence of his father he was early introduced to the excellent society of the northern circuit, and he quickly extended his acquaintance to the notables of science, literature, and the drama. He seems to have been equally intimate with Faraday and Tyndall and Babbage, with Carlyle and Tennyson, with Dickens and Macready and Delaunay. In fact, we believe that somewhere in these pages the name of almost every Englishman of any considerable distinction in recent times is mentioned as that of an acquaintance, and of a large number of them some anecdote, generally humorous, is preserved.

"Remembrances," in the sense of "Recollections," is a rather singular usage even on the part of a sometime Queen's Remembrancer. But some quaintness of expression may be allowed to a functionary who actually requires the rendering of feudal services, and presides with gravity while the Solicitor of the City of London counts out horse-shoes and nails, in respect of a forge which formerly existed near St. Clement Danes in the Strand, and chops representative faggots with an axe and a bill-hook, in respect of certain land in Shropshire. A far more serious matter, and, considering the literary habits of the author, a discreditable breach of good manners, is his flinging his memoirs at the public without introduction, preface, or index. He seems to have, in the first place, written down the story of his youthful experiences out of his "remembrance"; then to have sandwiched in a number of letters without offering any explanation of them; and finally to have fallen back on his diary and printed it without revision. For example: The reader is left to find out that letters signed "Fred. Pollock" are not from the author but from his father, while the author is to be found under the initials "W. F. P." One is continually reflecting that Sir Frederick is not making the most of his opportunities, and that so accomplished a man of the world ought to have furnished better appointments to our entertainment. Because of these offences, we shall refrain from paying the author several compliments that have occurred to us, and proceed without remorse to transfer some of his best stories to these columns. Considering the time that we had wasted on account of the omission of an index, we intended to begin with a striking remark of Talleyrand's concerning ennui and loss of time; but, owing to this omission, we cannot find it. The following is probably the best of all the stories of Lord Dudley's absence of mind:

"He was dining with King William and Queen Adelaide, and was sitting next the Queen. Some dish was handed round, to which Lord Dudley helped himself, and, finding it much to his liking, and being a great judge of good eating, he thought it his duty to tell his neighbor of it. So, forgetting where he was, and all the etiquette of the palace, he turned to the Queen and said, 'You really ought to take some of this; it is most excellent.' The Queen only smiled and thanked him. A minute afterwards the same thought came again into Lord Dudley's head, and again he strongly urged the Queen to have some, with the same result. After another short interval, for the third time he pressed the capital merits of the dish upon the Queen's notice, who then replied, 'I am glad you like it, Lord Dudley. It must be very good, for this is the third time you have told me of it.' Then he, remembering that, but forgetting everything else, exclaimed, loud enough to be heard by all the table, 'Damn the woman, so it is!'"

This may be contrasted with the story of Dugald Stewart's memory. He was once asked what was the earliest thing he could remember, and said it was being left alone by his nurse in his cradle, and resolving to tell of her as soon as he could speak. Of this character must have been the memories of the parties mentioned in the anecdote of Lady Acton, whom Pollock met in 1868, and who remembered talking at Naples to an officer who had been in the service of Louis XIV. (ob. 1715).

The account of the desperate and illegal efforts made by Mrs. Carlyle to relieve her husband of jury-duty, of his frantic protestations, and of his success in bringing around the obstinate juror "with a huge flat head and evidently no sense in it, cheeks flowing down far and wide," who had starved out juries before, and had the firmest mind in England, is too long to quote, but will appeal to many of our readers. Other sufferers will appreciate the caustic wit of Justice Maule, who, being asked by a friend what sort of instructions he should give to his architect, said: "Don't let him know what you really want, or you will be sure not to get it." A very pointed speech of Mrs. Grote's is recorded. She went to see Louis Napoleon in Paris about 1849, "when he, remembering some former misunderstanding between them, chose to be very cool and distant in his reception of her, and only asked her, 'Do you stay long in Paris?' when she had her revenge by answering, 'No; do you?'"

For after-dinner use there is nothing better than the story of the conversation with Sir John Bayley at a Northern Circuit dinner in 1842, where, among other great wines, was a White Hermitage, of which Bayley said:

"'This reminds me of a wine I once got in travelling. I was with another man, going out of Lyons, when the carriage broke down, and, while they were setting it to rights, we went into a little inn by the roadside, where they brought us some White Hermitage. It was so good that we did not leave the house until we had drunk it all.' I asked how long that was. 'About three weeks,' he said. I was lost in admiration at the philosophy of this way of travelling."

For those who wish to be instructed as well as entertained, we will quote an anecdote told by Kinglake, which contains the substance of volumes upon the political history of France. During an election under the Second Empire, Montalembert desired his tenants to go and vote as he wished against the Government. "They came back without having voted. He asked: 'Pourquoi n'avez-vous pas voté?' 'Mais, Monsieur le Comte, il y avaient des gendarmes.' 'Qu'est-ce qu'ils ont fait?' 'Rien, Monsieur le Comte.' 'Qu'est-ce qu'ils ont dit?' 'Rien, Monsieur le Comte.' 'Mais, pourquoi donc . . .?' 'Ils y étaient, Monsieur le Comte.'"

There is not much that is substantial in the book, but it is very pleasant reading. It is evident enough that the author is a genial and popular man, many-sided in his tastes and accomplishments—he translated Dante, among other things—and he has had a full share of the good things of this life, all of which he has known how to appreciate. His feeling remarks upon the great Guildhall dinners remind us of the epicure who confided to a friend that he liked good things to eat—and a great many of them—and to have them last a long time. But, after all, the dinner is the central event of the day in modern life, and though one may share Hawthorne's perplexity as to the occupations of Englishmen in a dinnerless hereafter, it is the feast of reason and flow of soul that sublimate such occasions.

The Master of the Gunnery. A Memorial of Frederick William Gunn. By his Pupils. New York: The Gunn Memorial Association (H. W. B. Howard, Secretary, 27 Park Place). 1887.

THIS beautiful quarto volume, richly and gracefully illustrated, is, as the title indicates, the memorial of a school and of its master. In this case the master was the school, just as a great preacher is the church. Mr. Gunn's personality was so strong, uncompromising (though tender), and vital that he became a very part of his pupils, and his taking-off was felt by each as a family, even a parental, bereavement. Nothing could exceed the good taste of this memorial, which supplements the monument placed at the teacher's grave. Seven of the "Gunnery's" alumni—W. H. Gibson, George A. Hickox, U. S. Senator O. H. Platt, Ehrich K. Rossiter, Clarence Deming, James P. Platt, and H. W. B. Howard—have coöperated to write the chapters which form a very complete picture of the man and of the scene of his labors. The literary quality of these several contributions is high and well sustained, with little repetition. Mr. Gibson, the delightful artist of rural nature, furnishes the introduction which Mr. Beecher's sudden death prevented him from writing—not as a pupil, of course, but as a patron of the school, and a warm friend of its head, by correspondence of temperament and of opinion. Mr. Gibson, however, in his 'Pastoral Days,' had already published charming reminiscences of his school life, and his chief part in the present enterprise has been the designs which give it a rare embellishment.

The admirable chapter on "Old Times in Judea," the historical background from which Mr. Gunn emerges, is topographically close of kin to the setting of Judd's 'Margaret,' and not less so in respect to manners and customs—the prevailing intemperance, the ridiculous militia, the clerical opposition to reform. Parson Hayes dispensed pulpit anathemas on heretics and unlicensed abolition apostles in Washington, Conn., and followed up an anti-slavery address by the gentle Quakeress, Abby Kelley, from Massachusetts, with a sermon whose text, meant to rebuke a woman's speaking in public, accused her of fornication and adultery. He brought, too, all his influence and that of his church to bear on Mr. Gunn as an abolitionist, excommunicating him religiously and socially, and hindering his endeavor to establish a school in the neighborhood. Indeed, this memorial is a genuine and valuable chapter of New England anti-slavery history.

Mr. Gunn's attitude towards intemperance

was as pronounced as towards slavery and the pro-slavery religion of the day. He never lowered his standards for the sake of promoting his worldly fortune, and one of the most characteristic and touching passages in this volume occurs in a letter to his future wife, written while he was keeping school in Pennsylvania, and he seemed likely to have to face the question which Prudence Crandall met so nobly in his native State, whether he would deny instruction to any child on account of its color. In these matters, as time went on, his Connecticut townsmen came round to his side, or learned to differ from him and respect him. Like many another "fanatical" and "visionary" and "infidel" abolitionist, he gave them object lessons in practical charity and public spirit. Like Tolstoi, "he obtained permission to plough, fertilize, and sow a worn-out meadow owned by a widow or man too poor to cultivate it, afterwards taking great satisfaction in the sight of the new crop of fresh green herbage which he had produced." He came to be relied upon to settle disputes in town meeting. He gave a powerful lift to the village library, and fostered the social life of a large territory by introducing lecturers and by founding a successful dramatic institution for public objects. His school gave distinction to the place. He taught manliness, purity, and honor rather than a high degree of learning, in ways suggested by his knowledge of human nature, sympathy with boy nature in particular, and eccentric humor. He had no method to transmit or to be formulated for imitation. One feels, from the loving testimony here gathered together, and from his own "Words" preserved in the appendix, that he was a compeer of Evarts, Benjamin Silliman, and Chief-Justice Waite, his classmates at Yale, though his sphere was confined to a little corner of the Nutmeg State.

Olden-Time Music: A Compilation from Newspapers and Books. By Henry M. Brooks. Boston: Ticknor & Co. 12mo, pp. xx, 283.

THE bulk of the material is the apparent excuse for taking this volume out of the somewhat more handy "Olden-Time Series," to which it belongs by every characteristic. It sets out with an account of music in England before the Puritans came over, and it determines the hither limit of the "olden time" in this country by the year 1830, "although a few matters of a later date are incidentally mentioned." Mr. Brooks's method is unfavorable to a general view or distinct impression, yet much information is conveyed in a desultory manner. His reviewer can hardly be more connected. We read on page 33:

"An examination of the earliest 'inventories' in the Probate Office of Essex County [Mass.] fails to find record of any musical instruments appraised in the estates settled there. While every pot, skillet, gridiron, article of wearing apparel, old chair and table, bed, bolster and pillow, silver spoon, pewter dish, bushel of corn—indeed, articles of the most trifling nature—are carefully enumerated, no lutes, citterns, spinets, harpsichords, flutes, or viols are mentioned. This would seem to show that the early settlers did not possess these instruments, or that at least they must have been rarely seen here."

The first church-organ in Salem, purchased in 1743, was the fifth set up in New England; King's Chapel, Boston, having had the first. Dr. Flagg, a Boston dentist, going abroad in 1797, advertised that, if supported, he would "contract in Europe for the construction of a number of organs, calculated to play all tunes usually sung in places of worship, with interludes to each psalm, without the assistance of an organist." A Broadwood piano of 1791 is preserved at the rooms of the Essex Institute in Salem, and is pictured on page 141. Its contracted keyboard suggests an interesting comparison between the precocity of Mozart and Josef Hofmann as infant performers in public.

Mr. Brooks furnishes a large variety of concert programmes; and when Signor Pucci comes on the scene in 1815, the printer makes diabolic work of his foreign titles, as is the custom even to this day. Thus: "French Air—*a Gevudire Mama*," and "Song—*Alosanfan, dul' la Patri* (*Marseilles Hymn*)." In Salem, in 1816, there was a Jews'-Harp Club, which on February 2 was entreated to be punctual in attendance at a rehearsal of Handel's Hallelujah Chorus. The pedal harp was played by Master P. Lewis at an "extraordinary concert" in Boylston Hall, Boston, April 8, 1819, "after seven weeks' practice on that difficult Instrument." We recall no other mention of it in these pages, but as the only index is, oddly enough, one of proper names, our memory must pass for what it is worth. In the same city in 1790, a concert was given "for the benefit of Oliver Barron, one of the unhappy men who were cast away on Grand Manan; by which accident he had the misfortune to freeze his feet to such a degree as to be under the necessity of having them cut off, which has rendered him unable to support himself."

The great instrument-makers, Elias Hook with his organs and Jonas Chickering with his pianos; the first American composer, "William Billings, a native of Boston, in New England," and a genuine "original"; Henry K. Oliver, author of the hymn known as "Federal Street"; and a great number of minor personages, are directly or incidentally the subject of Mr. Brooks's discourse or of his newspaper clippings. He also reproduces some of the older music and some forgotten odes and ballads, and gives several curious delineations of spinets, harpsichords, and pianos, facsimiles of pictorial advertisements, a portrait silhouette, etc.

Christianity, Islam and the Negro Race. By Edward W. Blyden, LL.D., late Minister Plenipotentiary of the Republic of Liberia at the Court of St. James's. London: W. B. Whittingham & Co. 1887.

THE most striking thing to be noted in connection with this book is the personality of its author. Born in the island of St. Thomas, of the purest negro parentage, he went to Liberia in his seventeenth year, and there obtained his education and has spent the larger part of his life. In 1862 he was elected to a professorship in the newly founded College of Liberia, and became President of that institution in 1881. For two years he was the republic's Secretary of State, and in 1877 was appointed Minister to England. He has travelled extensively in Africa, spent some time in Syria acquiring Arabic, and has frequently visited the United States. He has been an acquaintance and correspondent of Lord Brougham, of Dean Stanley and Mr. Gladstone, and of Charles Sumner. When we add that, besides his knowledge of the classics, of Hebrew, Arabic, and several African dialects, he quotes familiarly from German, French, Italian, and Spanish authors, it may be believed that, as has been said of him, he is the most scholarly man of his race now living. And that he is not deficient in the rarer qualities of thorough and patient study, some of the papers in the book before us give abundant testimony. They show broad reading, minute investigation, a surprising mental alertness. As a speaker, according to those who have heard him in this country, he has an unusually persuasive eloquence.

It would be strange if such a man could have escaped entirely the limitations of his inheritance, and the judicious reader of his pages will not be surprised to find occasional displays of narrow prejudice. One such is seen in his rather laughable displeasure at the custom of writing negro with a small "n." He says of one of the remaining survivors of the original American abolitionists, that he "shows his own conception of the status and functions of the Negro by never using a capital letter in writing the word that describes the race" (p. 113, note). Thus to stick in the bark of a mere question of usage seems particularly ridiculous in view of the fact that Dr. Blyden repeatedly writes "whites" and "white man" with a small "w." In some more important matters, he shows a lack of good mental balance. We will instance his ideas on the proper education of negroes, as propounded in his inaugural address as President of the College of Liberia. He seriously contends for the wisdom of cutting off the great mass of Liberian youth from all knowledge of history, of science, of literature, or philosophy, since the Middle Ages. "We are still held in bondage by our indiscriminate and injudicious use of a foreign literature" (p. 89). "The instruments of culture which we shall employ in the College will be chiefly the Classics and Mathematics. By Classics I mean the Greek and Latin languages and their literature. In those languages there is not, as far as I know, a sentence, a word, or a syllable disparaging to the Negro. He may get nourishment from them without taking in any race-poison. They will perform no sinister work upon his consciousness, and give no unholy bias to his inclinations" (p. 97). These extracts will indicate the author's fanciful idea that the thing which keeps the negro degraded is the knowledge that his ancestors were slaves. He squarely says: "There is nothing that we need to know for the work of building up this country, in its moral, political, and religious character, which we may not learn from the ancients. There is nothing in the domain of literature, philosophy, or religion for which we need to be dependent upon the moderns." To speak of only one of the surprising parts of this educational programme, we cannot help asking if Dr. Blyden means to get on without the idea of personal rights, so peculiarly modern. What does he say to his students, when they come upon the Greek and Roman conception of slavery as the natural and inevitable lot of some classes in society? Or is it simply negro slavery that he is afraid to have mentioned in their hearing?

The two main contentions of the articles and addresses here collected by Dr. Blyden are, first, that the spread of Islam in western Africa has been almost an unmixed good to the tribes brought under its sway, and, second, that Christian missions to Africa, as at present conducted, will continue to be failures until they are put into the hands of natives. Liberia, he thinks, is to become the great source of evangelizing influences, and its future position as the leading African power and civilizer is to be assured, he believes, by the emigration of hundreds of thousands of negroes from the United States to the home of their fathers. As a speculation, this seems to us hardly worth discussing; but we must seriously question some of Dr. Blyden's statements of fact on this subject. He positively asserts that there are "thousands and tens of thousands" of the colored population of the United States who, "in various parts of the country, are asking for aid to reach the land of their fathers." In an

address delivered before the Colonization Society, in 1880, he said that "there are thousands of Negroes, in comfortable circumstances here, who are yet yearning after the land of their fathers." But if "in comfortable circumstances," why not go at once at their own expense? Why "ask for aid"? The truth is, that there is a woful want of definiteness and absence of proof in all these broad statements. If they were true, it is incredible that nothing should have been heard of them in the press of this country. We have been warned of a great many imminent negro "exoduses" to various parts of the world, but never of a single one to Liberia. Dr. Blyden may be entirely correct, but we cannot be expected to believe it without a scrap of evidence. In the absence of that, we must rather think that his vague assertions rest wholly upon equally vague assurances of sympathy for his project, given him, here and there, as a result of his impassioned appeals. If there is anything more than this back of what he says, it was inexcusable in him not to have declared it; not to have given a single name of man or locality, nor a single application for transportation to Liberia, nor a single reference to persons who could substantiate his allegations. He admits that no considerable emigration is to be looked for without Government aid. That he should think this obtainable marks him as a highly sanguine spirit; that he should think that if it were obtained, "the emigration might be so excessive as to imperil the vital interests of the colony," that "the ambitious and turbulent" could be excluded and "thousands of industrious, hard-working farmers and mechanics" induced to go, seems to us a proof almost of temporary mental aberration.

What Dr. Blyden has to say about the relative achievements and prospects of Mohammedanism and Christianity in Africa is, of course, entitled to great respect from his position and opportunities. He cannot, however, blame the advocates of Christian missions if they argue from his exaggerating and enthusiastic habit of speech, as exemplified elsewhere, that he is more forensic than judicial in his discussions of these points. But it cannot well be doubted that he strongly reinforces the testimony going to show that, in west Africa at least, Islam has worked for civilization and moral improvement. A Christian himself, his profound conviction that the methods of Christian missions in Africa need radically to be changed, ought to receive at least a patient hearing from the authorities whom he addresses.

Ireland. By the Hon. Emily Lawless. [The Story of the Nations.] G. P. Putnam's Sons. 1888.

It was not without considerable misgivings that we opened this book. Miss Lawless's conception of the Irish character in 'Hurrish,' and her close connection with one of the families most opposed to the Irish people on the land question, did not appear to us to qualify her for the task she had undertaken. A careful examination of the book proves that we were mistaken. It is an honest piece of work. The author does not accord sufficient merit to the supremacy in some respects of the early Christian art of the country, or realize the iniquity of the means by which Pitt's Union was accomplished, or give any key to the present troubles. We cannot agree with her that the struggle "has been almost wholly an agrarian one," or that we have no precedents to guide us in discounting the possible effects of home rule. There are a few unimportant slips as to dates and statements; but on the whole we have seldom met a work of the kind more conscientiously written, or which we could more unhesitatingly recommend. Many of the maps and illustrations are admirable. We must, however, enter our protest against the insertion of so many old engravings, which have been doing duty hither and thither for the past forty years, and to the distressing inequality in the scale of the portraits; nor is the selection of subjects for portraiture altogether happy.

Introductory Steps in Science, for the use of schools. By Paul Bert. Translated by Marc F. Vallette, LL.D., revised and enlarged by John Mickleborough, Ph.D. Appletons. 1887. 8vo, xiv, 363 pp., illustrated.

In the *Nation* of February 4, 1886, was noticed the version by Madame Bert of her husband's classical little manual for young children. The present work, by its title-page, purports to be an original translation, but the internal evidence would indicate that Madame Bert's language has been adopted almost bodily. It has been modified here and there, usually for the worse as regards style (although the original was literal and somewhat rough), and in the direction of inaccuracy as regards statement. The additions for the most part are such as tend to take away the elementary and harmonious character of the original, by inserting data more suitable for older students or remarks which are sometimes ludicrously pedantic.

The substitution of American animals and illustrations for those more familiar to European children which are given by Bert, would be an improvement if done with judgment; and larger cuts are to be preferred to those of the original. But the zoölogical part has evidently been revised by a person having little qualification for such a task; the cuts err on the side of excess, and, having been prepared for other works and merely utilized here, are not as well suited to the purpose as one might wish. By their insertion the book has been made larger and more costly, but, on the whole, we should prefer for our own use Madame Bert's original version with all its faults.

BOOKS OF THE WEEK.

Barrows, W. The Indian's Side of the Indian Question. Boston: D. Lothrop Co. $1.
Bonar, J. Letters of David Ricardo to Thomas Robert Malthus. 1810-1820. Macmillan & Co. $2.75.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 16, 1888.

The Week.

WHY the Extradition Treaty with Great Britain has been rejected in the Senate—for postponement until next December amounts to rejection—nobody seems to know exactly. The Committee on Foreign Relations reported unanimously in its favor a year ago, and voted solidly for its confirmation on Wednesday week; but it was laid over, owing, the *Tribune* frankly admits, to "the determined opposition of the Republican Senators." The explanation of this "determined opposition" is probably to be found in the further remark that "the Democratic Senators who voted for confirmation seemed to lose sight of the claim for protection and sympathy which political offenders of Irish nationality have upon this country." As the fourth article of the treaty exempts crimes of a "political character," and as the interpretation of this phrase would lie with the courts of the country from which the surrender was demanded, it is hard to say what it was the Democrats lost sight of. The truth is, that no political offenders except the dynamiters would have anything to fear from the treaty, as they would come in under the clause touching "malicious injury to property whereby the life of any person shall have been endangered." That there was some sort of relation established between them and the Republicans during the Blaine campaign, there is unhappily no reason to doubt. They were all enthusiastic supporters of the Republican candidate, and the worst of them were received and spoken of by Blaine in the most kindly terms. "Should auld acquaintance be forgot?" was, therefore, very likely a question which some of the Republican Senators were compelled to ask themselves. In the meantime the rejection of the treaty permits the continuance of that great disgrace to the American name—the steady growth of the American colony of bank defaulters in Canada.

The talk about Gen. Sheridan as a possible Republican nominee for President was at first regarded as a joke, but some of the politicians appear disposed to take it seriously. It is hardly likely, however, that anything will come of it, for the reason that discussion must demonstrate the weakness of such a nomination. The selection of Sheridan, indeed, would be regarded by the country as a confession on the part of the Republicans that they stood no chance of carrying the election on an appeal to the sober sense of the nation, but hoped they might succeed in carrying voters off their feet by a wave of enthusiasm. But the time for such an experiment to stand any chance of success long since passed. A generation has come on the stage which has grown up—a large proportion of which, indeed, has been born—since the civil war ended, and to which the civil war is only a matter of history, precisely like the Mexican war or the war of 1812. "Sheridan and Shenandoah would be all the platform we should want," says a Connecticut politician who takes kindly to this candidacy; but he forgets that the voters of November, 1888, who have been born since the campaign of 1864 in the Shenandoah—that is, the voters twenty-one, twenty-two, twenty-three, and twenty-four years old — will exceed in numbers the voters who have passed their fifty-second year—that is, the survivors of the men who were twenty-five years old when the war broke out. Gen. Sheridan has never shown any qualification for a civil office, and the time long since passed when the country would elect an unfit man to the Presidency simply because he was once a good soldier.

Gov. Hill's boom, which was never very robust, is suffering visibly from that revelation about a piano, billiard-table, and other articles of luxury which he has bought for the Executive Mansion, not only with the State's money, but with a portion of that money which was authorized for an entirely different purpose. It appears now that Gov. Cornell had a billiard-table, but that he paid for it from his own pocket, and that when Gov. Cleveland succeeded to the office he bought the same table of his predecessor and paid $300 for it, from his own pocket also. All this makes the showing for Gov. Hill, as the greatest living exponent of Jeffersonian simplicity and pure, old-fashioned Democracy, peculiarly embarrassing. If he had not made such frequent professions of superiority in these regards, he might have escaped without much criticism. There seems to be no adequate remedy for the harm he has done to his boom, save to buy the piano and billiard-table from the State, and promise publicly when he is through his service as Governor to present them in Labor's name to the Anti-Poverty Society.

Nearly a quarter of a century has elapsed since Lincoln's death, and he seems to have belonged so entirely to an earlier generation that it is rather surprising to reflect that, if he had survived till now, he would not have passed the period of possible activity. If he had lived, he would be just entering his eightieth year. Justice Bradley of the United States Supreme Court is within a month of being seventy-five. Senator Payne of Ohio was seventy-seven last November, and Senator Morrill of Vermont will be seventy-eight in April. Gladstone will be seventy-nine next December. There was a melancholy tone about the speeches at the dinner of the Republican Club in this city on Saturday evening in honor of Lincoln's birthday, as though the orators felt the absurdity of considering the Republicanism of 1888 as a lineal successor to that of a quarter of a century ago. Devotion to the bloody shirt and sneers at the Mugwumps were the chief characteristics of the speeches, and there was not from first to last a progressive note. One of the Western Senators vigorously condemned the position recently taken by Mr. J. S. Clarkson, editor of the *Iowa State Register*, and Iowa member of the Republican National Committee, in declaring that the party must give up the bloody shirt, remarking that "now and then some demoralized leader sends out his note of warning that the people are growing sore of this issue, and that the battle of 1888 must be fought out upon the economic issue solely." Another Republican Senator "pitched into" the President for his record in the matter of pension vetoes, quite forgetful of the fact that the veto of the Dependent Pension Bill was heartily applauded by a large number of the most prominent Republican newspapers of the country, and that the Democrats carried this pivotal State last fall by 17,000 votes after a canvass in which the Republicans made Mr. Cleveland's pension policy an issue.

Amid the flood of explanations as to the real causes for the separation of George and McGlynn, it is not difficult to see that the fundamental cause is the falling off in money supplies. The McGlynn wing, led by Mr. Barnes, the Secretary of the United Labor party, is in favor of running a Presidential candidate this year. Barnes stated his programme at a conference of the party's leaders recently. It was to have a Labor candidate for the Presidency, and confine the campaign in his behalf to the States of New York, New Jersey, Connecticut, and Indiana. When this plan was unfolded, somebody present "gave away" the whole scheme by remarking: "The Butler business over again." That is undoubtedly the scheme, and the world would not be astonished if the hand of the Blaine thimbleriggers were to be found upon the wire which is working it. George has refused flatly to have anything to do with it, but McGlynn and Barnes, foreseeing an end very shortly to the contributions at the Anti-Poverty meetings, are looking about for means of subsistence. A campaign fund, contributed in the interest of the "Butler business over again," would pay Barnes's salary for this year at least, and would keep McGlynn also from want. But as a Republican investment, what a losing business it would be! Its grand total of votes would fall below Butler's immortal 3,499.

The correspondence between President Corbin and Mr. John W. Hayes, "Secretary General Executive Board," follows the lines set by Gen. Hoxie and Martin Irons in the Southwestern strike two years ago. Mr. Hayes wants to know whether Mr. Corbin will not arrange for a meeting to settle the difficulty between the Reading Railroad Company and its "employees," meaning those persons who have left the company's service and are no longer in its employ. That was just what

Martin Irons demanded. He and his deluded followers cherished a fiction that they were still in the company's employ, although not at the moment on its pay-rolls, and although they were doing everything in their power to prevent the running of its trains. Mr. Corbin replies as Gen. Hoxie did, that there is no difficulty between the company and its employees, and therefore nothing to confer about, but he adds that he is willing to discuss the question of wages at any time with anybody in the company's employ, and that this rule will be followed with any coal-miners who may return to unoccupied places, but that he cannot undertake to pay higher wages than his competitors pay. This is an inexpugnable position. It is possible, though not probable, that the companies in the Wyoming Valley may agree to pay an advance, in which case the Reading Company would do the same, but without such concurrence on the part of the competing companies the upshot of an advance by the Reading Company would be to extinguish their property in the course of the next few years as completely as though it were swallowed by an earthquake.

Congressman Ford of Michigan the other day showed the House of Representatives how to reduce the surplus by more than three millions, presenting for that purpose a petition of 140 furniture manufacturers, asking for the repeal of the duties on burlaps, on silvered mirrors, on coal, and on sponges, and the reduction of the duties on unsilvered French plate glass to 30 per cent., the present duty ranging from 101 to 152 per cent., according to sizes. "Notwithstanding this excessive protection," say the petitioners, "it has been demonstrated that it was impracticable to manufacture glass suitable for mirrors in this country, and every looking-glass plate used by furniture manufacturers to-day is imported." Nevertheless, they are willing to pay a duty of 30 per cent. in case anybody should desire at some future time to try his hand at the trade. As to burlaps used for packing furniture for transportation, they say that there was imported last year $3,756,795.40 worth, paying a tax of $1,176,706.42, and that "this article never was and cannot be profitably made in this country, owing to climate and other influences, and there is no industry in the United States protected by this tax." We have a faint recollection of the existence of a manufactory of burlaps in the State of Maine during the war period. Perhaps it has been extinguished ere now by some tax on its raw materials, but if it is still alive, we apprehend that a pretty vigorous fight will be made against the repeal of the duty, in which case we should advise the furniture makers to buy it up and put it and themselves out of misery. The petition concludes by saying: "The collection of these taxes does not benefit any industry in this country, but is a grievous burden to furniture manufacturers, and if our petition is granted it will divert from the national Treasury $3,573,802.54 annually, and will save this amount and many millions more to the people."

The Bangor *Daily Commercial* of February 9 protests vigorously against a repeal of the duty on lumber, and reads a lecture to the Republican Congressmen who are believed to favor such repeal. "There are," it says, "as many Republicans as there are Democrats who advocate free lumber. A large number of the Republican Representatives favor free lumber, and but for this it would not be possible to pass such an act by the House. The Senate has a Republican majority, and should lumber be placed upon the free list, the Republicans as well as the Democrats in Congress will be responsible for the act." The reason why the duty should not be repealed, says the *Commercial*, is that the Canadian lumbermen are not so heavily taxed as our lumbermen, and can therefore afford to sell lumber at lower rates. "*After a radical reduction of the tariff*," it continues, "making it possible for our lumbermen to conduct their operations at as low a cost as do the Canadians, it will be early enough for the placing of lumber upon the free list." It sees no objection, however, to putting coal on the free list, and seems to favor that measure in the interest of our manufacturing establishments. What a vicious circle the high-tariff argument travels in! You must not lower the duty on any one thing unless you lower it on all things, but you must not lower it on all things because you will ruin American industry if you do.

The *Commercial Bulletin* publishes an analysis of the bill of the Undervaluations Committee of the Senate, showing it to be about the most mediæval and discreditable contrivance ever conceived to cripple and restrict our intercourse with foreign nations. The object of the bill is to prevent consignments of goods to this country, and to throw trade back to the conditions of a quarter of a century ago. It is an advantage to the people of the United States to have goods in bonded warehouse ready for consumption, just as it is an advantage to have commercial travellers seeking customers and selling by sample. It is proposed, also, in this bill to restore the duties on coverings and on charges from the place of manufacture to the place of export. This is really an increase of the tariff, and, as the *Bulletin* shows, is in violation of that clause of the Constitution which requires that all bills for raising revenue shall originate in the House—this, too, at a time when we are trying to reduce the surplus. It is proposed, also, to make it presumptive evidence of fraud if the appraisers advance the valuation of an invoice 5 per cent. In order to add to the cumbrousness of the present system, and put one more obstacle in the way of the importer, it is provided that there shall be three appraisements instead of two in every case where either the Government or the merchant shall be dissatisfied. The present system provides for an appraisement, with the right of appeal from the local appraiser to the Board of General Appraisers. The pending bill provides for an appraisement and an appeal to one general appraiser, and from him to a board of three general appraisers, and the phraseology in which this complicated system is sought to be defined is so tortuous and involved that endless litigation must grow out of it. If such a bill should happen to pass Congress, we trust that the President will veto it in behalf of modern civilization and in the interest of commerce, which his message has done so much to promote and popularize.

Had the *Tribune's* Washington detective examined the record respecting compensation to United States district attorneys under section 827 of the Revised Statutes, he would have seen that Secretary Manning, in his annual report for 1885, page xlii., on the "Collection of Duties," clearly exhibited all the facts thereunto belonging. The early practice was to look upon suits by importers against collectors to recover money illegally exacted on imports as private suits, in which the Collector must look out for the defence, inasmuch as his estate would be levied on to satisfy a judgment. But when, in 1863, the law said no such personal liability should attach, if the Collector levied the duty by order of the Treasury, and the Treasury must pay the judgment, the law also gave to district attorneys an extra fee for defending the suits, to be fixed by the court. Mr. Manning told Congress that, in the three years just prior to 1877, those fees to the United States District Attorney in New York were $40,499, and all the work done by salaried Government officers. On June 4, 1877, Secretary Sherman ordered that the allowance to any district attorney in one year should not be paid by the Treasury in excess of $4,000. Secretary Fairchild does seem to have revoked Secretary Sherman's order, whose effect was to reduce the fee which, if certified by the court as proper, the statute says the District Attorney "*shall receive*"; but it is not to be supposed that Secretary Fairchild intended to restore the old annual fees of $12,000 or $20,000 a year. The subject demands the attention of Congress, as Mr. Manning urged. Fees and perquisites of that character are all wrong. The District Attorney's office should be properly equipped, and each person in it paid a fair annual salary. The fee-perquisite arrangement always leads to scandals.

The Ballot Reform Bill, prepared by a committee of the Commonwealth Club, and submitted for revision and approval to the committees of several other local organizations and clubs, has now been put in final shape for presentation to the Legislature, and sent to Albany. Every effort has been made to provide for a simple and effective application of the principles of the proposed reform to our system of voting, and the public-spirited gentlemen who have devoted so much time and thought to the work are confident that they have succeeded in their purpose. There has been no trace of partisanship in their labors, and there should be none in the consideration of the question by the Legislature. The ad-

vocates of the change are unanimously of the belief that it would be most unwise to have the first election under the new method take place in a Presidential year, for obvious reasons, and a section has been added to this bill, providing that, if it become a law, it shall not take effect till January 1, 1889.

Massachusetts now falls into line with a ballot-reform bill, which has been presented by Mr. Hayes, a member of the House from Lynn, and is under consideration in committee. Its provisions are much like those of the bills before the New York Legislature. They place the expense of printing and distributing the ballots upon the State, and follow the methods of printing and voting which the New York bills have adopted, mainly from the English laws. The names of all candidates for all national, State, and county offices are to be printed upon one ticket, and all those for municipal offices on another; the voter is to check with a cross the names of those for whom he wishes to vote. This will require one very long ticket, but they are accustomed to that in Massachusetts. We could not follow that plan in this city without having our ballot-boxes enlarged to the size of barrels, for if we were to have all the names of all the candidates of all our local organizations for all offices printed upon one ballot, its length would be portentous. The resulting delay and confusion in voting such a ballot would be very great.

The working of the new High-License Law in Pennsylvania, which is now going into operation, will be an interesting and instructive study. In many respects it is the most stringent measure of the kind which has been enacted in any State. Its most restrictive provision is that requiring each applicant for a license to have two reputable freeholders of his ward or township go on his bond for $2,000 each, and such bondsmen must be owners of unencumbered real estate worth at least $2,000, and must not be engaged in the manufacture of liquors. No man can be bondsman for more than one applicant. The chief effect of this requirement has been, of course, to prevent the brewers from taking out large numbers of licenses in liquor-dealers' names. The result is that in Philadelphia, where under the old law there were about 6,000 liquor-saloons, there have been only 3,423 applications filed for licenses, and at least 1,000 of these will either be withdrawn or abandoned because the bondsmen cannot qualify under the law. Philadelphia is likely to start on her high-license experiment, therefore, with her saloons reduced from 6,000 to about 2,500, according to official estimates. In the cities of Pittsburgh and Allegheny, which are both in the same county, there have been only 1,350 applications for licenses, against 3,000 under the old law; and so on through the State.

The experience which Michigan is having with high-tax and local-option laws working together is very instructive. The State has had a tax law for several years, and at the last session of the Legislature its rates were considerably advanced, so that at present it levies upon all manufacturers of intoxicating and spirituous liquors, and upon all dealers doing both a wholesale and retail trade in the same, a tax of $800 a year; upon wholesale dealers in such liquors, $500, and upon retail dealers in the same, $500; upon manufacturers of malt or brewed liquors only, $65, and upon all dealers in malt or brewed liquor only, $300. In addition to these amendments of the law, the same Legislature passed a local-option law which gives to any county the power by majority vote to decide whether or not liquor shall be sold within its limits. In order to ascertain the latest official information about the success of these laws, we wrote recently to the Governor of the State, and obtained the following response:

"Our old tax law has been measurably successful. It has driven the saloon out of the rural districts and reduced the number in the cities and villages. In 1878 the tax reported to the Auditor-General was $373,416.25, and the number of dealers, 4,203. In 1886 the amount of tax was $1,186,366.95, and the number of dealers 4,759. Previous to the passage of the act there were many more saloons, but we cannot readily state the number. Ten counties have voted on the question of local option, in all of which the decision has been against the traffic, generally by good majorities. Ten more will soon vote, with probably the same result."

It will be seen that the tax-law statistics given by the Governor are those for the year 1886, but the tax at that time was $500 and $300 where in the amended law it is $500 and $800. The latest figures on local option give fourteen counties which have decided in favor of prohibition. As to the number of saloons existing before the tax law was passed, we are able to give them without the Governor's aid. After twenty years of prohibition, Michigan had in 1874, 6,444 saloons, or 1 for every 207 inhabitants. The tax law was passed in 1875, and in 1876, one year after it went into effect, the number of saloons had been reduced to 4,867, a decrease of 1,577. In 1877, a further reduction was made to 3,996. In 1882, six years after the law went into effect, the number had fallen to 3,461, or 1 to every 536 of population, a decrease of nearly 50 per cent. If the ratio of 1874 had been maintained, the State would have had in 1882 8,966 saloons, and would have to-day at least 10,000, instead of 4,203. It will be seen that the number for 1886, in spite of an increase of more than half a million in population, is 2,241 less than it was in 1874, when the State was under a prohibitory law.

The official report of the Chief of State Police to the Rhode Island Legislature, setting forth the failure of prohibition, contains some instructive reading. The reports to the Chief from his subordinates in various parts of the State are classified according to the information which they give, and in the class of those who "report no complaints, and assign reasons therefor," appears the following from the Town Sergeant of Glocester: "I arrested one man a year ago for keeping a common nuisance, and I lost the case, as the best men in the town, even to the President of the Council, testified against me. For the lack of support, no arrests or seizures have been made by me, as the majority of the town is in favor of liquor." Commenting upon this frank avowal, the Providence *Journal* says it "pithily states the real cause for the failure of our prohibitory legislation," and that the general truth which is meant to be conveyed by it "is undoubtedly applicable to the State as a whole," and adds: "While, of course, it is not true that a majority of our people are 'in favor of liquor,' it is certainly true that a majority are not giving the law any support, or the enforcing officers any encouragement to do their duty. They are not giving it because they do not believe, after the experience they have had, that prohibition is a proper or practical method of liquor regulation. That being the case, no amount of amendment or addition can make the Prohibitory Law a success." This is the lesson which has been taught over and over again—that prohibition laws cannot be enforced except where public sentiment in their favor predominates.

Prince Bismarck's Military Bill has been passed without a dissentient voice. Under it he will, as he himself has said, have about a million of men for service in case of war on the French frontier, a million on the Russian frontier, and a million in reserve. Neither he nor anybody else has given the slightest intimation as to the period when the necessity for these precautions will pass away. It will certainly not be in his lifetime. As long as the French refuse to resign themselves to the loss of Alsace and Lorraine, and the Russians maintain that they have rights which are still unrecognized in Bulgaria, Germany and Austria will probably have to remain armed as at present, and in both countries the military art will continue to make the tremendous drafts on the national stock of talent, both scientific and administrative, which it is now making. This is really almost a greater misfortune for the community than the mere material loss inflicted by the withdrawal of large masses of men from peaceful industry or the expenditure on the material of war. Bismarck truly said in his speech that no other nation had such a supply of military officers as Germany—that is, such a supply of men of training, capacity, and character for the conduct of armies. But this simply means that in no other country is there so large a body of the ablest administrators, and most ingenious contrivers, and most careful observers, and most industrious and diligent brain-workers, devoting themselves to perfecting the means of destroying life and property at short notice. This is the kernel, in fact, of the whole European situation. This system of great armaments is as yet only about twenty years old. It is still too soon to judge what its final effect on European society and politics will be, but it will certainly be something very novel, and very unlike what people looked for when the steam engine first began to excite the imagination of social philosophers.

"THE FLORENCE MESSAGE."

Now that the "Florence Message" from Mr. Blaine has been accepted by the bulk of the party as his definitive retirement from the Presidential arena, the process of construing it in the light of subsequent events, which all Mr. Blaine's utterances have to undergo, has already begun and is progressing rapidly, with very entertaining results. In the first place, most people are much impressed, and his friends are naturally a little dismayed, by the account he gives of the state of things which will be witnessed after his departure. The whole of his letter, barring one short paragraph, is taken up with an account of the bright future which awaits the party after it has lost his services as a candidate. This, of course, makes it appear that those who thought him absolutely necessary to its success made a terrible mistake, and that it could have very well done without him all along.

Another very curious passage in the Message is that in which he asserts that "one thing only is necessary to assure success—complete harmony and cordial coöperation on the part of all Republicans." This has been by no means the understanding of the matter on which the party managers have acted of late years. There is nothing they have more carefully guarded against than "harmony," for whenever the Mugwumps showed any sign of willingness to come back, they have been warned off, and any party candidates they have supported have been sedulously "knifed." The managers have, indeed, ever since 1884, held and preached that "the one thing necessary to assure success" was not "harmony," but Blaine, and that nobody could be a good Republican, no matter how much he liked harmony or coöperation, if he did not like Blaine. This modification of the creed by the Master's hand, naturally, therefore, excites surprise as well as sorrow.

Other views of the letter are varied and interesting. Mr. Depew, while lost in admiration of Mr. Blaine, and liking the Paris Message for its "picturesque peculiarity," maintains that the Florence Message "must be interpreted by the facts and circumstances which have preceded it." As, however, these "facts and circumstances" are only known to a favored few, the work of Blaine hermeneutics must necessarily be confined to a small order of hierophants. We do not suppose there are over one dozen men in the country qualified by training and natural powers to interpret the Master correctly, and of course they are kept very busy. Senator Hawley thinks that though the Message means declination, nevertheless Mr. Blaine may be nominated in spite of it. Mr. Warner Miller was "profoundly stirred" by the Message, and believed the withdrawal to be sincere, but could not be induced to say that it would prevent Mr. Blaine's nomination. Ex-Judge Noah Davis was much moved by it, as "the letter of a patriot and statesman," and thought the Democrats, too, would regret it, because, if they cannot have Cleveland, they must, the ex-Judge thinks, want Blaine in the Presidency. Mr. Jesse Seligman was "enthusiastic" over it, because it increased his admiration for Blaine, and made him want him for President more than ever, and declared that he was needed in Wall Street to revive business. There was "almost grief" at the Produce and Cotton Exchanges, the *Tribune* says, over the Message, which, we suppose, resembles grief as the mist resembles the rain. Police Commissioner "Steve" French felt quite certain that the Message was sincere, but appeared entirely reconciled to the situation. Commissioner "Johnny" McClave took the same view, was afflicted by the withdrawal, but was certain it was "final." Mr. Edward Mitchell mourned over it too, but saw that it would lead to "unity." Ex-Attorney-General Leslie W. Russell also thought the Message "final," as did Gen. John A. Foster, but hoped "the Convention would override his (Mr. Blaine's) wishes as they did Garfield's," whose nomination, it would appear, was made in spite of his kicks and screams. "Tom" Platt was also profoundly afflicted by the news, but was convinced that Mr. Blaine must now be considered out of the race. The *Tribune* also discovered great disappointment among the temperance people. Albert Griffin of the National Republican Saloon Committee did the "voicing of this sentiment of regret."

We might greatly multiply these citations from the leading Blaine organ. They all go to show that while the sorrow in the party over the Message is deep and universal, it is also for the most part sorrow without hope. Almost everybody who is consulted, after the first burst of grief is over, expresses his firm belief that a man like Blaine could never be induced to change his mind, that he is as much out of the race as if he were dead, and that the party must now go to work with aching heart to fill up the void. It is proper to remark, however, that a Washington correspondent telegraphs "that the subject is not closed, and that the letter is to receive its fuller explanation in some additional statements which will not be made public for some days." We have little doubt this is true. No matter what statement Mr. Blaine makes, an additional statement is sure to come in a few days, but in this case it will not affect the situation. The curtain has fallen, and it is only a very small circle of admirers whom Mr. Blaine made conspicuous, and who will never be conspicuous again, who wish to have it raised again. The lights may be kept burning till the house empties, and the house may empty slowly, but the play is over.

SOUTHERN HOMICIDE.

THE editor of the Knoxville (Tenn.) *Daily Journal*, of whose manful fight for his life at the church door on Sunday we gave some account a fortnight ago, is apparently dissatisfied with our comments on that tragic occurrence, for he has sent us a much-marked copy of his paper containing an answer to our criticisms. What he objects to is in the main the inferences we drew or appeared to draw from the fight, as to the condition of Southern sentiment on the subject of homicidal encounters and the carrying of concealed weapons. He says we are "disposed to magnify every violation of law in the Southern States and hold it up as an evidence of a general demoralization of Southern society." This is very far indeed from the truth. On the contrary, we have for many years, while commenting on Southern readiness to shed blood about trifles, endeavored to guard against the inference that the homicidal tendency was evidence of "general demoralization." In fact, one of the most surprising things about it, we have always thought and said, was that it existed in the midst of a civilization in other respects so high. For instance, in the present case of the editor of the *Journal*, we should not in this part of the world expect a man who carried a loaded pistol in his pocket on Sunday, and was expert in its use, to go to church at all. But at Knoxville the editor, although he knew that some desperate fellows were on his track, instead of having them arrested and bound over to keep the peace, went armed and ready for them to his place of worship, and was able, by his energy and activity, to kill one and wound another at the door of the sacred edifice, though himself wounded severely. There is an incongruity about this sort of thing which strikes the Northern mind as very odd. One finds it difficult to realize that men who are so constantly armed, so ready to use their weapons in private quarrels and fight for life in the public streets, wear black broadcloth and buy their meat at the butcher's. One rather expects to see them wearing an arsenal in their belts, and a brilliant red jacket and beautiful white petticoats like an Albanian or Montenegrin.

The Knoxville *Journal*, curiously enough, thinks it answers our complaints about Southern customs in this matter of homicide and deadly weapons, by pointing out that there are many crimes committed at the North; that a farmer was recently waylaid, murdered, and robbed in Ohio; that "not long ago a woman was found murdered in New Jersey," and that "only last week a man killed his own mother in the city of Brooklyn with an axe." All this shows a curious inability to comprehend what the Northern charge against the South is. Nobody maintains that ordinary crime, murders, robberies, and the like, are not as common at the North as at the South, and, indeed, much more common. What we charge is, that encounters with deadly weapons between more or less respectable men, in the public streets, are disgracefully frequent at the South, though much less so than a few years ago; that men of good character and standing, instead of appealing to the police, respond with hideous readiness to the invitations of bullies and rowdies to engage in single combat with them in the public highways, and discredit American civilization by butchering each other like Zulus or red Indians.

If the Knoxville *Journal* could give us some examples in this part of the country of furious encounters with knives and pistols

between prominent lawyers, or doctors, or merchants; if it could show that when a litigant assaulted a judge for deciding against him, the judge had to commit suicide to escape the shame of refusing to fight a duel with the blackguard, or to shoot him from behind a fence, as happened two or three years ago in Kentucky; or that a deacon or elder, when he had a falling out with a man, made no scruple of warning him to go armed, in order that he might be attacked on equal terms, as now and then happens at the South; or, in fact, that murder readily occurs to decent men in good social standing at the North as a remedy for trifling social wrongs, then indeed it would have us on the hip.

We admit there has been a great improvement at the South in this matter within the last seven years. A prominent man in South Carolina has lately had the courage to bring a suit for libel, instead of sending a challenge. Similar things have occurred in other parts of the South, and they show great progress. But that there is still considerable room for improvement the Knoxville editor's way of meeting his assailants shows, as does also an article which, curiously enough, he prints in his paper immediately before the one in which he answers us. This article comments on "the shooting of Editor Ellis of the Birmingham *Hornet* last Saturday," and it endeavors to show that Editor Ellis had but little to complain of, because he "abused everybody who crossed his path. His strong point was vituperation, and whoever incurred the displeasure of the editor was made the object upon which filth was emptied by wholesale." Now, we have many such editors in these parts, but nobody thinks of murdering them. Doubtless some of them richly deserve to die, but members of a civilized community, if rightly constituted, refuse to inflict capital punishment on any man, in their own quarrel, without a proper trial by a legal tribunal. One of the inconveniences to which a man has to submit when he becomes a member of such a community, in return for countless benefits, is daily contact with many people who, he is satisfied, are not fit to live. But any one who cannot put up with this inconvenience is really a savage, no matter what kind of clothes he wears.

FROUDE AND MARX.

Mr. Froude's book on the West Indies, which we reviewed last week, and which is really a political pamphlet embellished with picturesque descriptions of travel, brings out very strikingly the close agreement of the Socialist and Carlylese philosophers on one point. Mr. Froude, and all his school of political thinkers, are disgusted with representative governments and deliberative assemblies. They would abolish them everywhere, except possibly in England. The orators by whom these assemblies are swayed they consider little short of a nuisance. They would have all races, beginning with the blacks, ruled by able administrators, regulating everything out of their own head, and, if possible, feeling more or less pity and contempt for those over whom they reign. The possible exceptions to this rule are Englishmen and Americans, though about the Americans we are not so sure. But all other men are summoned, with more or less energy, to provide themselves with masters, if they wish to escape both temporal ruin and eternal damnation. They must give up jabbering and consulting, and learn to obey. They must throw their orators into the sea, and put good admirals and generals in their places. What is wanted in the West Indies, for instance, is not parliamentary institutions, but a batch of austere and determined governors who would "make the niggers mind," or "stand round," as an old Southern overseer would say. The Irish in these matters are much in the same boat as the blacks. If they knew what was good for them, they would be clamoring now, not for home rule, but for a peculiarly stern viceroy who would govern them in the Anglo-Indian fashion. The governors, of course, would see that they were industrious, that they did not talk too much, that they did not waste their money, and that they took as nearly an English view of life as they were capable of.

The Socialists would organize society in very nearly the same way. We do not believe they are as hostile to talk as Mr. Froude, and they care much less than he does about political arrangements. But they agree with him thoroughly as to the unfitness of most men to manage their own business. They are even more opposed to home rule than he is, for they would not let anybody rule his own home. They would, if they could, provide administrators who would take charge of all the "instruments of production"—that is, the land, mines, houses, machinery, and railroads—and then tell us all what kind of business to engage in, in what manner we should carry it on, where and how the product should be sold or disposed of, and how the money or other consideration received for it, should be spent. In fact, we think it would on the whole be worse to be a "nigger" or an Irishman under Karl Marx than under Mr. Froude. There would be even more government, and the governors would not be nearly such gentlemanly men as Mr. Froude's.

It will be seen from all this that, widely as the two schools differ in the view they take of human society, they agree in making tremendous demands on the exceedingly small stock of administrative talent with which Providence has thought fit to endow the human race. If Mr. Froude had his way, and, after getting rid of the parliaments and the talkers, were to undertake to equip every community with a really competent ruler, it is not too much to say that he would need in the British Empire alone fully 1,000 men of the first order of ability. They would all, too, in order to avoid the danger of frequent changes, have to be in perfect physical condition, and very careful about their diet and clothing, and very pure in heart. In fact, Washington after Yorktown, or the Duke of Wellington after Waterloo, is about the sort of man who would pass a Carlylese examining board for a gubernatorial place. On the question how these governors are to be found Mr. Froude is silent, from which we must infer that the process is an easy one, and that the scarcity of Washingtons and Wellingtons in the early part of the century was due simply to inadequate search. With our present advertising facilities, they would doubtless be forthcoming in great numbers. We should only have to put a "want" into the *Herald* or the *World*, and they would appear in swarms with best recommendations from their last places, and no objections to the country.

One is puzzled in the same way in reading Karl Marx. A child can see that after the capitalists were all hanged or banished, and the instruments of production seized upon, the "job" would still have to be "bossed" by somebody. In fact, we should then need fully as many bosses as there are now capitalists, and, as the stimulus of private interest would be wanting, they would have all to be men of the highest capacity and character—that is, they must be in administrative talent equal to our best railroad presidents, in morals to the best of our bishops and other clergymen, and in sympathy and tender-heartedness to the best mothers of large families in the country. To get an adequate idea of the kind of work that would devolve on them, one must imagine one's self bound on getting up every morning to see that the inhabitants of one large New York block attended diligently to their business during the day, gave every man his due, were properly provided with food, clothing, theatre and car-tickets, that their milk was pure, and that their water ran on the upper stories, and the plumbing was in good order.

Neither Marx nor any other Socialistic writer, any more than Mr. Froude, gives us the slightest hint where this kind of talent can be found in the needful quantity. We presume that they, too, would rely on advertising among the "wants" in a morning paper. That the responses would be numerous is of course certain; but how would the selection be made, and who would watch the inspectors after they had taken office, to see that they got up in time in the morning, kept their accounts properly, and had no private stores of dainties and no favorites among the workers?

We must do Marx and his fellows the justice to say that they do not hint that they themselves would be good men for the place. With Mr. Froude, on the other hand, there is no such modesty. No reader can lay down his book without feeling that he knows at least one man who could promptly pacify Ireland or regenerate the West Indies, and who could, if called on in time, even save the British Empire from Gladstone and the orators.

COERCION IN JAPAN.

Japan has not yet exhausted her resources of surprise. At the end of 1885 she crowned the series of revolutions begun in 1868 by apparently eliminating the Asiatic features of her Government. The triple premiership common to China, Corea, and Nippon was abolished, several courses of official inter-

mediaries between the throne and the people were removed, 8,000 unnecessary office-holders were discharged, and her ministers of state were appointed by and made responsible to the Mikado. Young men educated in Europe or America were made the chief executive servants and closest counsellors of the Emperor, who became more than ever an actual ruler. Ito, born in 1840, for a while at school in England, and somewhat noted as a speech-maker in the United States in 1871, became "Minister President of State." All this was in the direction of healthy reform, and in the spirit of the revolution of 1868, as embodied in the oath of the Mikado to form a government based on public opinion.

The closing days of 1887, however, have seen a different and disappointing state of affairs. On the 26th of December, a flash of lightning, followed by a roar of thunder out of a blue sky, an imperial rescript dated December 25 was published. It laid a ban on all secret societies and assemblies, and authorized the police to put a stop, without recourse, to open-air meetings. With the sanction of the Minister of Home Affairs, they were to warn away, deport, or imprison all suspected persons living within eight miles of the palace. To the Cabinet were given full powers to "proclaim districts imperilled by popular excitement," and practically to put the whole body of the people therein under martial law. The interpretation was not long wanting to the text, for within a few days after its issue several hundred persons — children, boys, and men—and these mostly from the province of Tosa, were summarily removed from Tokio or cast into prison for not instantly obeying the police. The suspects are to be under surveillance for a period of from two to five years. This means that even their private letters will be opened, and their lives made a burden. It means also that the able men suspected will be politically disabled until after 1890. Ostensibly, the cause of this high-handed act, shameful even in a despotism like that of Japan, is the discovery of a plot to murder Count Ito, the Minister President of State. As simple fact, it followed on the appearance in the capital of a deputation of overtaxed people who came to petition for redress.

To a close observer of Japanese affairs the edge of surprise is taken off by a study of certain recent events which seemed as surely prognostic of some sudden political change as the subsidence of water in a well forebodes an earthquake. That we may appreciate these, it is only necessary to know the ruling principle and secret springs of Japanese politics. The Mikado is still a fetish, and whichever party holds his person is the Government, and the only legitimate expression of "the will of heaven." Who ever opposes this body-guard in power is a *chō-téki* (imperial enemy, traitor). In all Japanese history, no noble, knight, gentleman, or commoner ever attempts to seize the throne; the ambitious man aims only to get possession of the Son of Heaven. This done, and his former keepers beheaded, a new government is formed. In 1868, in Kioto, a few clever leaders of the Satsuma, Choshiu, and Tosa clans were able to do this, and to upset the established order of two and a half centuries, even the Tokugawa shogunate in Yedo, and ultimately to abolish the whole feudal system. In the flush of their triumph, they made the boy Mikado take an oath before gods and men to form a government based on public opinion. They were Liberals then, but revolutions move faster than the men who start them. Busy for years in crushing three great rebellions got up by "chō-téki," who wanted the Emperor to have new counsellors, disappointed in their foreign diplomacy, sobered by their tremendous responsibilities, these once hot-headed Liberals reverted to an ultra-conservative type, even while the opinion of the reading classes moved towards democratic ideas. Only after they had filled the prisons of Japan with editors and men of learning, and when the public pressure was becoming dangerous on all sides, did the Mikado's keepers yield. In 1881 they reaffirmed the imperial promise that a parliament should be assembled, and named the date, 1890.

Almost to a man the joyful Liberals believed that this would be on the British model. Hence they kept silence even when the office-holders converted themselves into noblemen, with fat salaries and allowances, and profusely distributed decorations to themselves and their foreign favorites. This they did because they saw that material must be supplied for the upper as well as the lower house of the Parliament to be. Patiently, too, they bore both the restrictive measures and the grinding taxation, even while companies of political favorites were annually junketing through Europe at a cost of many tens of thousands of dollars. All this time the Government, consisting by a large majority of Satsuma and Choshiu men, became more closely centralized. The Tosa people, being as a rule men of the Liberal party, were left out of office.

Ito, visiting Europe, became fascinated with Bismarck and the Prussian methods of doing things. On his return a marked German influence was noticed. Germans were employed as teachers and advisers at court, and it soon became evident to the liberal Japanese patriots that the Prussian system, with ministers responsible to the sovereign, instead of the British method, which makes the ministers responsible to Parliament, would be chosen as the model for Japan in 1890.

To the Liberals, hoping for real representative institutions, this was rank treachery; Ito and his sympathizers had turned even the imperial oath into perjury. To root despotism still deeper, and make militarism still stronger, under the outward guise of Germanism and civilization, was a blow to their hopes for which the thoughtful men of Japan were but ill prepared. It is not, therefore, strange that plots against the life of the Mikado's ministers were rife; or that, on the other hand, the official espionage became more elaborate, the centralizing measures more stringent, and iron-handed despotism more openly avowed. Japan's Government for centuries has been that of "despotism tempered by assassination." Ito, who had seen most of his predecessors in high office made the assassin's target or the actual victims of his sword, was ever on the alert, knowing well that if "a vote of censure" were moved upon him, it would be in the usual form of assassination. If "his Majesty's Opposition" were successful, he and his colleagues would be beheaded. In the lack of a congress, parliament, or free press, this is the Asiatic method of asking for the resignation of obnoxious Cabinet officers.

No doubt plots were really made against the lives of the men who have forced the last imperial rescript, and by exile and semi-imprisonment of their rivals and enemies purged away the objectionable elements which might arise in the kind of parliament they want in 1890. Having turned Tokio into a camp, they yet find it necessary to do considerable beheading among the troops, who are at intervals suspected of aiding plotters. Only a few weeks ago the blood-pit was well moistened. Having crippled the once brilliant scheme of national education by spending from the imperial treasury less than a million dollars a year in this direction, and seventeen millions, or nearly one-fourth of the whole revenue, on the army and navy, they have also pushed forward a railroad system notoriously unnecessary, in order to have military roads, and by means of them to concentrate troops quickly at any point. As a final stroke, preparatory to this last characteristically Asiatic move, they succeeded in corrupting the foreign press. The chief newspaper at Yokohama has for years been under subsidy from Tokio, in the form of a large subscription, paid for out of the imperial treasury. Until a few days before the fateful Christmas Day of 1887, however, the other journal was pouring out its usual steady stream of criticism, to the exasperation of the Cabinet. It exposed, sometimes with harshness, but always ably, the shams of "statesmen" who were bidding for the sympathies of civilization. Suddenly, as readers of this long critical sheet noticed, its tone became as genial as a tropical zephyr. The secret was soon out. Its proprietor had earned leisure and coveted opportunities of travel by accepting a handsome salary from the Japanese Government simply to stay away. It now justifies and excuses even this Coercion Act. Accordingly, the comments of both these papers on the rescript, with its arrest, exile, or imprisonment of from 500 to 900 persons — acts which quite equal the worst in Russia—are the laughing-stock of both foreigners and natives. With the native press muzzled and the alien press corrupted, with a large army and fine navy at their back, and reverting, as they have done, to the vices of feudalism, the ministers now in power are masters of the situation.

The prospect of Japanese absolutism becoming a constitutional monarchy, or her people having any real share in the functions of government during this century, are now exceedingly remote. No doubt the advisers of the Emperor have the right to protect them-

selves, knowing their dangers. Still, so long as such methods are even supposed necessary, it is an idle dream for Japanese to imagine that Western governments will yield their extra-territorialty claims, or allow their citizens to come under such risks. The best friends of Japan can but hope that the recent measures are the result of overstrained nerves, and will by their authors be allowed to fall into "innocuous desuetude." If, however, such acts are repeated, the world will not be deceived as to the real character of Japan's much-boasted "civilization."

VOLAPÜK.—II.

UNIVERSITY OF MISSISSIPPI, January.

THE grammar of this new language is very brief. But if Volapük has come to stay sure enough, the syntax will assuredly have to be enlarged, because a fuller treatment will be demanded. A few points may be referred to here. As to the cases, there are four, as in German; but the question arises: How are different nations to be made to harmonize their varying conceptions of case relations? Schleyer says (p. 17) that his language "has neither an ablative, nor an instrumental or prepositional, local, causative, or negative (as the Lapland, Latin, Russian, and Sanscrit). For these cases the appropriate prepositions (usually with the nominative) are employed." He rejects these cases as unnecessary, but retains his German cases. If "Volapükists" can use prepositions to express *with*, *from*, *by*, why not do the same for *of* and *to*? How are we all to be brought to think *of* and *to* in the same places? Those who speak English will naturally consider their transitive verbs as followed by the accusative, and will append *i* to the nouns. "Notify the man," "Thank the man," "Ask the man." In these places we should undoubtedly use *mani* in writing Volapük. But in "Ask the man," a Frenchman would, of course, write *mane*, *e* doing in Volapük what *à* did for him in French. In "Thank the man" both the French and the Germans would write *mane*. The Volapük Almanach has several examples of mercantile letters (*Handelsbriefe*). One of them begins: "Wir haben die Ehre, Ihnen anzuzeigen," and for *Ihnen*, *oles* is given—*i. e.*, *ol* = you (du); *ole* = dat. sing. *to you;* and *oles* = dat. plural. In another letter we find "und danken Ihnen," and again *Ihnen* is *oles*. What would make a London or New York correspondent write anything but *olis* in these sentences?

The greatest curiosity will naturally be felt in regard to the verb, and just here is where this new language is in greatest danger of coming to grief. What sorts of renderings are given to such a multitude of forms? and in what state do we find the syntax of the verb? In answer to the first question we reply, knock off about a quarter of a million forms, by remembering that the "aoristic" formation in *i* just duplicates the other forms, and in translating add "constantly" to represent it. *E. g.*, in the verb *to love*, half the forms denote constant affection, while 250,000 forms are reserved for inconstant lovers. One very peculiar form of affection must be noted: "to love (or be loved) *multilaterally*." (Seret, p. 44, and p. 51). In fact, "multilateral" English is the only kind we can think of at all suited to such a vast system of inflection. "For to (shall love)," "for (to shall have loved)," are translations given to two of the supines (p. 45). "To love (just loving on)" renders an imperative-infinitive. "Be a loving one!" affords an example of an imperative-participle. If such imperatives seem at all shadowy, there is a "substantial imperative" given on p. 44. "Love govern!" translates its present tense. "Love must have governed!" is the perfect. For a future and future perfect imperative we have "I shall have to love constantly," and "I shall have had to love constantly." "A loving that had been" is an instance of a pluperfect infinitive. "Up to be loved!" shows us a passive imperative-infinitive. To show us what his "Jussiv" is capable of, and at the same time to afford a conspicuous example of the conciseness of Volapük, Schleyer gives the following: "pujelobsöz! wir *sollen* solche sein, die werden geschützt worden sein! (1 wort statt 9!)." "We *shall* be such as shall have been protected" is a form of imperative hardly adapted for a world-language in which no uncertainty or confusion of thought is to enter. And even this, no doubt, admits of improvement. If an Englishman is set upon by a foreign mob, with no mode of communication except Volapük, and if the above startling command has failed to cow his assailants, he has only to insert one letter to assure them that Britannia *always* protects her children. If he shouts "puijeloböz!" (I *shall* be such as shall have been *constantly* protected), with as much emphasis on *i* as can be given in a language that always accents the last syllable of its words, he will probably find that "abroad" will recognize his rights.

Let us see what Schleyer does with his moods. He forms his subjunctive by appending an unaccented *-la* to the verb and personal ending. His common rendering for it is *möchte*. Seret gives *might* with the following examples to illustrate its use: "That you might show: that she might lock: if it might happen: you might have halved." Spielmann translates this *-la* form *ich würde* schreiben, *du würdest* schreiben, etc. An interrogative subjunctive is provided for, and Seret gives "if you had not been animated" for *möchten sie nicht beseelt haben?* Schleyer adds the examples, *möchte man dabei sein werden? möchte es ein solches sein, welches das Papier gerötet hatte?* for which the English translator gives no equivalent. If our notion of the proper range of subjunctive constructions is by this time a trifle hazy, we have these additional examples of the interrogative construction: "Do I encourage? Did they rob? If you had answered?"; this last as the rendering for *hättet Ihr geantwortet?* Seret is not "all too" happy in his translations of the German subjunctive, strong as he may be in Volapük.

The treatment of the subjunctive will further illustrate one of the great difficulties in the way of a universal language, the difficulty, namely, of getting different peoples to look at the same thing in the same way. Seret's handling of the subjunctive we have already seen. Sprague's only account of it is its use after *if*, and the same is true of Dornbusch's translation of Kerckhoffs's abridged grammar, in which we find the added statement: "It is rarely used in Volapük." But surely we are not prepared to restrict ourselves in the use of conditional sentences implying that the real state of the case is just the reverse of the way the conditional sentence puts it—for the books seem to limit the subjunctive after *if* to "suppositions contrary to fact." If Volapük has come to stay, the subjunctive is bound to be used freely. Again: Schleyer tells us (p. 17) that his language prefers direct discourse to indirect, because of the greater clearness of the direct form, and—note this—"in order to avoid the too frequent use of the *-la* of the subjunctive," showing that *he* evidently had in mind other uses of the subjunctive than its use in "unreal" conditionals. And then on p. 47 we see him drop as naturally as possible into this very construction, in rendering into Volapük "Your friend is said to have come" (dein Freund *soll* gekommen sein: *sagon, das* flen olik *ekömom*-la).

As a note under the "Konjunktiv," Schleyer provides for a "Konditionalis," with the affix *-öv*: binolöv, *du würdest sein*. For this Spielmann would give binol-*la*, which, as we have seen, Schleyer would translate *du möchtest sein*. The world will assuredly demand something more satisfactory than this in its universal language. As further specimens of Seret's fine perception of the niceties of language, we note that on page 42 he translates the optative in the *singular* by *may I love*, *mayest thou love*, etc. When he reaches the plural of the same tense (present), it becomes "that we may love, that you may love," etc. Following this is a "N. B." telling us to mark the difference between *mägom* löfön, *he may love*, löfömös, *may he love!* and löfom-la, *that he might love*. On page 53 we have the optative "sanomös, he may cure! (not: he might cure)!" while on page 51 the opt. pass. pälöfomös is rendered *that he might be loved*, though it is only fair to say that the *might* in the last sentence is the rendering for the *ä*, the sign of the imperfect.

In any language the chapter on conditional sentences is always of interest to a scholar. In Volapük it is (as yet) a short one. The word for *if* is *if*, and Seret says the use of *if* is the same in both languages, and gives the example: "If November comes, we get snow." The English does not aid us to decide whether this refers to the future, or whether it is a general statement made in the present tense. The rendering shows it to be future, and classical exactness is shown in the use of the future perfect in the protasis: *if ukömom novul, ogetobs nifi*. The reader will remember that *o* is the future vowel, and *u* the future perfect vowel. Following this is another example: "If you come, I'll give thee my book." And to our surprise we find the present tense in both clauses. On p. 38 in Seret we find this paragraph: "*Would*, in conditional sentences, is expressed by the imperfect and the pluperfect tenses of the subjunctive mood (-la). To express it in the present, the perfect, and the future tenses (as, for example, I would be one that loves, that has loved, shall love, shall have loved, is loved),such is done by adding -öv (*v* of vilön) to the person of the verb. Ex. If one heard me (listened to me), I would be one that made the whole of mankind happy; if obi lilonöv, *bin*oböv be*läb*öl menadi lölik (7 Volapüka for 15 or 16 English words)." Such teachings in regard to subjunctives and conditionals as we gather from the two books, remind us of an answer given by a college student on an examination: "Lucid is when a thing is turbid with light." Evidently there is some work still to be done by philologists in the realm of Volapük syntax.

In the matter of sounds, any universal language has great difficulties to contend with. Schleyer rejected both *th* sounds, but retains the French u (ü). But did he not know that it is almost more than English mouths can accomplish to frame to pronounce this ü? We have heard his language called Vola*puck*, Vola*peek*, and Vola*puke* (u as *you*); we doubt if we have ever heard it pronounced in a way that would satisfy Schleyer. And the trouble is that distinctions of meaning are based upon giving this sound correctly. In his pronouns Schleyer has *ut*, *üt*, and *it* for *that* (demon. pron.), *that very* (*ebender* ὅσπερ) and *self*. Does he think he can get the English-speaking world to call *it*, *eet?* or *if*, *eef?* *Fut* and *füt* are both given in Seret's vocabulary as = *foot*, without any hint as to a difference. In Schleyer we find *fut* as a part of the body and *füt* as a measure. It is perfectly true

that if he had rejected sounds impossible or difficult to the various peoples, he would probably have been reduced to an exceedingly slim alphabet. As it is, with one of twenty-seven letters, he discards both the *th* sounds, several of our *a* sounds (*at*, *all*), the *oi* sound (boil), and *w*. Only a few words have *r*, so that flol=flower, lapin=rapine, flen=friend, blod=brother, plek=prayer, blek =break, blef=brevity, etc. Of the four sounds seen in the gradation *azure*, *ashore*, *age*, and *hatch*, Volapük recognizes only two, j=sh and c=j. The four-fold gradation is easy enough for us, who find no difficulty in distinguishing *Jews* from *choose*, and *joke* from *choke*. But a German is very apt to call himself a *cherman*. As Schleyer thus omits some of our most familiar ounds, and retains others that are a stumbling-block to us, other nations will find the same thing true for their language. To meet such difficulties Schleyer has a larger world-alphabet of thirty-seven letters for the purpose of "interpreting sounds and accents peculiar with some people or language."

When we come to the description of the sounds of Volapük, we are impressed once more with the impossibility of learning sounds out of books. Schleyer says, pronounce *e* as in German *es* and English *fell*. Seret gives *a* in *sale* as its equivalent, and this is undoubtedly right. Schleyer says, pronounce *i* as in German *ihm* and English *lip!* For *o* he gives German *Lob* and English *lock* as examples of the same sound; *u* is illustrated by *nur* and *pull*. We once heard a Scotchwoman ask a man if he wanted his *fool* (full) name painted on his trunk. Probably Schleyer had heard *pull* rhymed with *pool*. He tells us *ä* is not to be sounded like *e*. But Seret says the sound of *ä* is given in *any*, and Schleyer says *e* is sounded like *e* in *fell*. Nor is the matter made less confusing by his saying that *e* in German *es* represents the sound of *e* in Volapük. In what part of Germany is *es* pronounced to rhyme with our word *ace?* Again, since the largest percentage of his vocabulary is based on the English, the millions of people who speak English cannot but feel tempted to pronounce fät *fate* when they find that it *means* "fate." But as the pronouns *ät* and *et* mean different things, and as in the verb ä is the vowel for one tense (imperfect) and e for another (future), it is necessary to get these sounds accurately. We are glad to see that Schleyer requires his own people to make some difficult sounds. How are Germans going to distinguish cid, *chisel*, and cit, *cheat?* or fed, *treaty*, and fet, *fertility?* or leg, *genuineness*, and lek, *echo?* One other point we will mention as showing what the chance is of getting sounds from books. Schleyer gives Volapük *v* as equivalent to English *v*, and to German *w* in *webe*. Seret actually gives Volapük *v* as equivalent to *w* in wish! But in the following words, *sval* (swallow), Schwalbe, *svan* (swan), *svid* (sweet), *svim* (swim), *svin* (swine), and *svip* (sweep), the temptation is very strong to do as he says, and pronounce *v* like *w*.

The claim that in Volapük each letter has only one sound is not strictly correct. On page 16 Schleyer makes a distinction between -òs and -ós. We are to pronounce the first with long o (*ohs*), and the second about as o in toss (as toss would be pronounced in German). The "polite" pronoun "you," when it refers to one person, is given by the ending -òns—*i. e.*, *ohns;* but when it refers to more than one, the same ending is -óns, with the short sound as given above. This useless encumbrance, we may add, was done away with by the Munich Congress. *S* has the two sounds we are all accustomed to. For *c* only the sound of our *j* is given; but it is evidently intended to include the *ch* sound (*church*). As *cem*, *cif*, *cop*, and *cüt* mean *chamber*, *chief*, *chop* (hew), and *cheat*, and evidently came from the English, it can hardly be that we are expected to change the sound from *ch* to *j*. In *cog*, *joke*, we have the same initial sound in both languages. But as Schleyer has no *cok* in his vocabulary, it looks very much as if his German pronunciation of final *g* overcame him, and as if he wrote *cog*, but felt *cok*.

One point more. Among the various defects of existing languages that Volapük, according to Schleyer, either avoids entirely or seeks to reduce to a minimum, is an excessive number of meanings for words. He instances *Anstand*, *coup*, *bill*. This is evidently a good point to make. When a schoolboy comes upon *bellum*, his mind is at peace; he is pretty safe in translating it *war*. But when he falls foul of *ratio*, he is most likely at a standstill. A world language, in aiming at simplicity here, has a serious difficulty to encounter in avoiding undue inflation of its vocabulary. If each word is to have only one meaning, the number of words will be swelled enormously; and this huge vocabulary would be rendered additionally difficult from the fact that the same forces that in other languages have given different uses to the same word, would come into play here too, and the world-language would probably find itself "toting double," carrying at the same time a long list of words and a variety of meanings for many of them.

If any of this criticism seems unfair, as directed more against Seret's presentation of Volapük than against the language itself, it must be remembered that Seret's book is the authorized exponent of Volapük for the millions of people who speak English. It is "the second (greatly revised) edition, translated and published with the consent of the inventor," and Seret is a "certified teacher of the universal language." His book contains the standard lexicon of Volapük, and is on this account essential to a student of the new language. But though Schleyer has been extremely unfortunate in his accepted translator, Volapük is itself responsible for most of the defects we have pointed out. It seems astounding that Schleyer should have sought to impose upon the world his vast verbal system. In its very principle it militates against the manifest trend of the Aryan languages, which is to substitute analysis for synthesis in verb-formation. It is perfectly true that only a very small percentage of these more than half a million forms are needed for practical use, or likely to be practically used. But they are there, and Schleyer counts his verb one of the glories of his invention. And we have not touched upon some important points in which we feel sure Volapük is in danger. In the attempt to squeeze varying idioms into this one mould, we think the mould is going to crack. At the same time we freely concede a great deal that admiring Volapükists claim for the language. One can learn to express himself in it with great rapidity. We have received a letter in Volapük written after two days' study; and any one who has travelled in a country with whose language he was only very slightly acquainted knows how slim a stock of words suffices for actual needs; so that Volapük may prove to be of great assistance, when its study shall have become widespread. We think that Schleyer has made an excellent beginning, and that his language may be made the starting-point of a very useful medium of communication. But the difficulties are not all solved yet, as we have perhaps succeeded in showing. As for Schleyer himself, with his vast learning, his prodigious talent for work, and his great poverty, we feel that he is a man deserving of our sincere respect and sympathy. We are not only anxious to see his language improved, but we respond with a hearty Amen! to the words with which, speaking of the inventor of Volapük, he concludes his preface to the seventh edition of his 'Mittlere Grammatik':

"Dar 'imel bésere sein ardenlòs!"

ADDISON HOGE.

THE CROFTERS' REVOLT.

LONDON, January 26, 1888.

"ANARCHY IN THE LEWES," "Civil War in the Hebrides," "Raising the Standard of Revolt in the Lewes," are sensational headings which have been appearing lately in the London papers. I wonder how many Americans know what and where the Lewes is. Until last summer it was to me barely a name. In England it is known to a few sportsmen, and to as few enterprising tourists sent there by Mr. Black's descriptions in the 'Princess of Thule.' Those of the Western Islands to which Dr. Johnson went on his famous journey are much more accessible than they were in his day; throughout the summer there are daily excursions to Iona, Staffa, and Mull, and to Skye. Steamers even run from the mainland to the Outer Hebrides so entirely for the benefit of sportsmen and tourists that their last consideration is the convenience of natives. But the number of travellers who go so far through Hebridean seas is small compared to that of the crowds who, during the season, daily overrun Iona and "do" the Cuchullins in Skye.

Lewes is the furthest north of the Outer Hebrides. As a rule, the papers, like the general public, ignore it. The late disturbances have forced it into prominence. The crofters and cottars marched upon one of the great deer forests of the island and drove the deer towards the sea. They destroyed the fences of a large sheep farm and scattered the sheep. Constables and marines were despatched from the mainland to put down the rebellion. The ringleaders were captured, brought to Edinburgh, and, to the surprise of everybody, acquitted. The agitation spread to other districts of Lewes, to Ross-shire, to Skye. As a reason for their lawlessness, the people declare starvation is staring them in the face. Naturally interest has been aroused in their condition. That it has not been exaggerated by them even the *Times* and the *Scotsman* admit. Destitution reigns throughout the Lewes, and calls for immediate and radical relief.

An official inquiry has been made into the matter. Commissioners have gone from district to district, from cottage to cottage. They have questioned the people and examined their land. The report of their visit published in the *Scotsman* and the *Times*, like that of the Royal Commissioners of 1883, is cruel beyond belief. An entire population on the verge of starvation; men, women, and children living under the same roof and often in the same room with their cattle; whole families sleeping in one bed, with but one blanket to cover them; children with no clothing but old meal bags; hundreds and more crowded together on the barrenest tracks of land; little patches of cultivated ground squeezed in between the great bare boulders lying on the hillsides—these are the things that were seen in the Lewes. The people are without food, or will be in a few weeks; without money or credit; without hope, save in Providence. The story told of Lewes is true as well of all the Western Islands, of the greater part of the Highlands. I was in the Lewes last summer, and in Harris and Mull and Skye, and many of the smaller islands; I travelled through Argyllshire and Inverness

on the mainland. I did not keep to the tourist routes, but went over roads and to places seldom visited by strangers. I never imagined that in a country supposed to be civilized there could be such human misery, such human degradation. I have seen for myself peasants in France and Italy, slaves at home. The life of the negro in the Southern States was one of luxury compared to that of the Western Islanders. The poor, half-starved *contadini* on the plain of Lombardy have not less to eat than the crofters and cottars of the Highlands. The shepherd on the Roman Campagna may be as rudely sheltered and as badly off for fuel; but with him it is summer, not winter, nine months of the year. The sun rarely shines in the Hebrides even in midsummer; scarce a day passes without rain.

The worst of it is that destitution is no new thing in the islands. One hundred years ago it moved Pennant to pity. Even Dr. Johnson, whose sympathies were all with the laird, was struck by it. A few years earlier the "extreme poverty, idleness, and distress of the people" had made such an impression upon a Mr. John Knox that he became one of the chief promoters of the British Fishery Company, whose object was to bring a new industry into the Islands and Western Highlands, and thus save the people from complete beggary. Forty years ago the *Scotsman* issued a series of letters from its reporter in the Hebrides, which, in the main, were much the same as the reports it has just published. There was at least one brief interval of prosperity, but while it greatly increased the rental of landlords, it left the small tenants or crofters no better off than they were before. Again and again the people would have died of hunger but for the charity of the outside world. Almost every year petitions come from their far northern home for the meal without which they cannot live through the long wet winter. For the last 150 years life in the Highlands has been one long bitter struggle, not of clan against clan, but of an entire people against hunger and want.

When the causes for the present destitution are sought, landlords are ready with their explanation: the Highlands are over-populated; the fisheries for the last two seasons have been failures; the soil is naturally sterile. The people, on the other hand, declare that only certain districts are over-populated. This is true; you can walk for miles through the Highlands and Islands and see nothing but moorland. Since the beginning of the century the Highlands have been made into a desert for deer and grouse. Men and women and children have been driven from many hills and glens to make way for game; from others, to make way for sheep. They have been crowded together on the shores of certain lochs and of the sea, and then blamed for dividing and subdividing their crofts. It is principally against this injustice they are now rebelling. If the men of the Lewes are accused of lawlessness, it must be remembered that they first tried to improve their condition by peaceable means. They sent a deputation to Lady Mathieson, their landlord, and petitioned her for more land. Her answer was one which finds favor among Scotch and Irish landlords: the land was hers, they had nothing to do with it. In the Highlands human beings are of less value than beasts and birds. Occasionally, when their misery is at its worst, their landlord gives them meal or blankets or seed, and abroad is praised for his charity. He spends thousands on building roads and harbors that add to his own comfort, and his philanthropy is extolled far and wide. But if the crofter's miserable cottage and patch of ground interfered with the same landlord's sport, the crofter was evicted, no matter how faithfully he had paid his rent, how carefully he and his father before him had worked his tiny farm. For years the crofter might pay road taxes, and not even a path was made to his township so long as there was question only of his and his fellow-crofters' convenience. Fishermen might land their boats as best they could; if their wants alone had been considered, the Islands would still be without a pier or a harbor. Until within the last few years everything has been done for the landlords, absolutely nothing for the people.

As for the alleged sterility of the soil, so high an authority as the Duke of Argyll has said that the soil of the Highlands is not naturally barren. The large farms and the laird's cultivated fields prove that he is right. As a rule, the poorest land has fallen to the share of the crofters, and crofts are so small that they have long since been overworked. Of course, there is always a chance of bad seasons. But with more and better land the crofters' harvest every year would not be starvation. It is the same with the fisheries. There are artificial as well as natural reasons for their failure. The fishermen are without boats for deep-sea fishing, without piers and harbors. Only the other day a practical example of their needs was given, when the forces sent to quell the disturbances in a fishing township of the Lewes were obliged to land ten miles off, for want of a harbor.

Through long years of oppression and misery the people have preserved their independence of spirit and natural shrewdness. To-day their landlords tell them their only hope is in emigration. The people's answer is, that until the land at home is cultivated, there is no reason for them to go into a strange country. When the Highlands are fully populated, then it will be time to think of emigration for their sons and daughters. The fact is, the late agitation in the Highlands is but an outcome of the same land war which is raging in Ireland, Wales, and England. The Crofters' Bill of 1886, with its many concessions to the crofters, the visit of the Royal Commissioners, with its enormous reduction of rents and cancelling of arrears, show which side is armed with justice. The Irish have never been so pitilessly rack-rented as the Highland crofters. For years the latter have been burdened with excessive rents and heavy taxes; they have had no fixity of tenure, no chance of redress; they have been the slaves of their landlord and his factor. They have seen their land laid waste and their kinsmen banished. The past oppression is the true explanation of the present sufferings. Charity may tide over the immediate need of the crofters, but until every clause of the Bill of 1886 is enforced, and new and more comprehensive bills are passed; until landlords cease to be slave-drivers, and Highlanders are, for the first time in history, free men—there will be heard the same cry of destitution in the Lewes and throughout the Highlands. N. N.

CARDUCCI AND DANTE.

ALASSIO, January 25, 1888.

LAST year the Italian Government decided to found, in the University of Rome, a professorship of Dante exegesis, in addition to those which had existed for many hundred years in some of the provincial universities. The debates in Parliament showed that the idea of the founders was a political one, and that while this chair was intended to be the highest official literary position in Italy, it was at the same time to be a permanent protest against the claims of the Papacy to temporal power. With the immediate and unanimous applause of the whole country the appointment was given to Giosuè Carducci, not only because his anti-papal feelings were well known, but because—*pace* Mr. Howells—he is the greatest poet of modern Italy, and at the same time (strange as it may seem) the greatest literary critic. At Bologna, where for many years Carducci has filled the chair of Italian Literature, and where he is the centre of a circle of poets and literary men who have great influence in Italy, strong objections were made to his departure, not only by the University, but also by the inhabitants and the municipal government. For a long time he seemed to hesitate, partly attracted by the position itself and the residence in the capital, partly kept back by the entreaties of his friends; but chiefly because the ideas which he had received after thirty years' study of Dante were different from those of the founders of the chair. He believed that Dante should be treated from the point of view of art, and not from that of contemporary politics. He therefore finally refused it. But the same reasons did not hold when it was decided to put the professorship for a while into commission, and ask four leading Dante scholars to give short courses during the present year. While the others accepted, the Senator Francesco Perez not only refused, but wrote a very foolish letter to justify his refusal, on the ground that, as the author of 'La Beatrice Svelata,' he should have been offered the post originally.

The first lecture of the course was given by Carducci on the 8th of January—"The Work of Dante." As might have been expected, occasion was taken to make a political demonstration, for Carducci was well known as a Republican by conviction (although he does not always carry his doctrines into his poems) and as a free-thinker. In the present delicate relations between the State and the Church almost anything may warrant a demonstration in the eyes of ultra patriots; and even the blindest could see that Dante was a determined opponent of the temporal power of the Popes. Ardent patriots in this century, from Balbo to Mazzini, twisting the meaning of Dante's words, had made his name the watchword in the struggle for Italian unity, although they might as well have chosen Sordello. The real claim of Petrarch, the great seer into the future, was forgotten. To such an extent was this carried that a great critic was able to write:

"Dante had a strange destiny. He was a Monarchist, and has been made out a Republican; he was a Catholic, and has been made out a Protestant; he was a Virgilian, and has been made out a Romanticist; he wanted the German Empire, and has done more than any one else to found the Italian nationality. The Italians treated him as he treated Virgil: they have taken him as a guide, and have constrained him to march in front of them."

This was, perhaps, allowable during the period of struggle, but it is time to restore Dante to the pure atmosphere of art. So Carducci thought when he felt obliged to refuse a professorship founded for political reasons, and so he found himself obliged to say in a strong passage of his discourse.

He had explained his views with regard to Dante in some essays published as long ago as 1874, and his state of feeling may be seen from one of his best sonnets in his latest volume, the spirit of which may perhaps be given even in an unrhymed version:

"Dante, whence comes it that my vows and voice,
Adoring thy proud lineaments, I raise;
That o'er thy verse, which made thee lean and wan,
The sun may set, the new dawn find me still?

For me Lucia prays not, nor prepares
For me Matilda fair the saving bath;
And Beatricë with her sacred love
In vain ascends to God from star to star.
I hate thy Holy Empire; with my sword
I should have thrust the crown from off the head
Of thy good Frederick in Olona's vale.
O'er Church and Empire, both now ruins sad,
Thy song soars up, and high in heaven resounds—
Though Jove may die, the poet's hymn remains."

Carducci thus began his discourse:

"From the rock where a few ruins on the surface of the soil show us the site of Canossa, from this white, bare, and lonely rock, enlivened neither by shades of groves, nor songs of birds, nor murmur of falling water, if we look about to mountain and valley, we perceive on one side a spur of the Apennines, the rock of Bismantua which Dante once climbed; on the other, in the pleasant Emilia, between Enza and Parma, the waste of Selva Piana, where the most beautiful *canzoni* of Petrarch were written; far off on another side Reggio, happy sojourn in youth of Ariosto; and, lower down towards the Po, Guastalla, the courtesy of whose princes lightened the sadness of Tasso. We cannot help thinking that it was not without some sort of fate that these memories of the poetic glory of Italy were collected around the rock and on the plain where the rupture between the Church and the Empire seemed to have the air of a fatal drama, the rupture from which came the liberty of the communes, that force of the Italian people which flowered in the arts and in poetry. . . . Papacy and Empire, their discord and their power, were passing away when Dante was born—Dante who does not pass away."

Carducci then goes on to relate in detail the characteristics of the period in which Dante lived; the expiring efforts of the Empire; the struggle of the Papacy under Boniface VIII. to become imperial, and the subsequent captivity of Avignon; the decline of chivalric poetry, French, Provençal, and German; the appearance of the two great Catholic theologians, St. Thomas Aquinas and St. Bonaventura, and of new saints like St. Francis of Assisi; the building of churches in Florence and elsewhere dedicated to the Virgin; the popular movements in Florence, and the rise of Italian tyrannies.

Here the lecturer, speaking of these memories of the victory of the popular party, of the spirits excited by liberty, of the pride of the citizens of the Free Towns desirous to vie with the knights, compares the state of Italy with that of Europe after 1815 in the era of Romanticism. There were the same disappointed hopes, the same reaction against the brutal reign of force and against carnal and material philosophic theories. There was a revival of spiritual religion, of the arts, especially of painting, and of poetry, particularly of the "dolce stilo nuovo," of which Dante was the greatest exemplar.

When the romanticism of Dante had finished with the 'Vita Nuova,' he became the first lay philosopher of the Italian people in the 'Convito,' "the importance of which for the history of culture is, that a layman dared bring philosophy from the religious schools and introduce it into civil life; the value for the history of thought, both of the poet and of Italy, lying in the fact that Dante brought into science his own conscience and a civic enthusiasm, and to impersonal scholastics, a dead thing, gave his eloquence, sometimes magnificent and solemn like his thought, at others ingenuous and sincere like his passion." Although the philosophy of the 'Convito' is in general theological, yet with Dante, as with the Greeks, philosophy is the loving use of wisdom; he, however, like the Romans, preferring the practical part—the moral and historical lessons:

"Depending from the 'Convito' are the treatises on Vulgar Eloquence and Monarchy, in which moral philosophy, applied to language, becomes poetics according to the theories of the Middle Ages; and according to these, as well as to the theories of the Greeks, when applied to affairs of state becomes politics."

Man has two loves, one temporal and one spiritual; for complete happiness in both he needs two guides and leaders—the State, or, according to Dante's idea, the Empire, and the Church. The Empire, he thought, had been established and recognized by God, inasmuch as Christ had not only humiliated himself to be born of Humanity, but had subjected himself to the census of Augustus, and submitted to death by the judgment of Pontius Pilate. This same theory of a dual government, temporal and spiritual, may be seen running through the 'Divina Commedia.' It is impossible to deny the grandeur of this ideal conception of the peace of the world in an alliance of Christian states under the presidency of the Emperor; but it is difficult to see in it more than the vision of a great poet dwelling longingly on the ideals of the past, as Homer did on those of heroic Greece.

"In any case, there is no need to seek in the monarchical maxims of Dante a beginning of Italian unity, except so far as it might be comprised in the unity of Christendom. The love of country and the national idea flame out in the poet's deep feeling of the glories and miseries of Italy, in his feeling of the Empire as a Roman Institution, as the Italian law and constitution. . . . The 'Monarchia' is the final scholastic expression of mediæval political classicism; and to seek there for what is now called the pagan or atheist state would be an injustice to Dante, according to his ideas. But let us boast—and that is no small thing—let us sincerely and surely boast, that Dante is our master and father in the preservation of the Roman tradition for the renewal of Italy, that he was the purest and most tremendous judge and witness for centuries of the bad government of Churchmen, and of the moral necessity for a change. This he did as poet. For Dante was above all things a very great poet—a great poet because he was a great man, and a great man because he had a great and heroic conscience."

All that the poet had previously written or thought or done was summed up in the 'Divina Commedia,' which was composed between the death of Beatrice and that of Henry VII. It is a representation of the last vision of the 'Vita Nuova,' the working of the moral and allegorical system of the 'Convito,' the glorification of the 'Vulgar Eloquence,' and the consecration of the 'Monarchy.' In the verses of the *dolce stilo nuovo*, Dante addressed himself to those faithful in love; in the 'Convito' to the lords of Italy; in the Latin treatises to clerks and doctors; in the 'Commedia' the poet sings to the whole people, and to all peoples.

"Its chief characters are three—Dante, Virgil, and Beatrice. The action is the present active moral and intellectual world, reflected and realized with unmeasured power of fancy on the stage of the future life, where thought has no limits except those that a creative poet with a harmonious mind chooses to set. Beatrice proceeds from the 'Vita Nuova' and from knightly and mystic poetry; but in the vision at the summit of Purgatory the cult of woman becomes apotheosis, and Beatrice transfigured is the supreme representation of the civilization of the Middle Ages. Virgil proceeds from the classic doctrine of the 'Convito'; he is no longer the magician of the Middle Ages, nor even the poet of the schools—he has become the representative of ancient civilization. Between antiquity and the Middle Ages, between Virgil and Beatrice, Dante is man, mankind, who passes with all his passions—who loves and hates, errs and falls, repents and rises, and, purged and regenerated, is worthy of mounting to the perfection of being."

So close is Carducci's argument, so powerful his style, that it would be impossible to represent the rest of his analysis of the great poem except in a careful translation. One of the concluding passages of the lecture, with reference to the inherited character of the poet, deserves to be cited:

"The lineaments of Dante's face bear witness to his Etruscan type, that type which still obstinately endures throughout all Tuscany, mixing with the Roman type and overpowering it. He boasted himself to be of Roman blood; and his representing his family as an old Florentine one, without titles of nobility, coming from great landed proprietors, and, up to a certain point, without names derived from a foreign tongue, makes it credible that there should be a continuous descent of country people in cities and regions less affected by Germanic intermixture. But Germanic blood happened to run in his veins from that lady who came to Cacciaguida from the Allighieri of Ferrara, of an ancient noble family in a city renewed by Longobard stocks, and which gave to her descendants a name of German origin. Thus to the artistic working out of the Christian vision Allighieri brought the character of mystery from beyond the tombs, from a sacerdotal race which seemed to have lived through tombs and in tombs, the Etruscan race; his straightforwardness and tenacity to life from a great civil race, the Roman, whose poetry was its *jus;* his audacious freshness and frankness from a new warrior's race, the German."

Correspondence.

INTERCOLLEGIATE SPORTS.

To the Editor of The Nation:

Sir: Beyond question, the friends and patrons of Harvard University most heartily endorse your comments upon President Eliot's report, especially your condemnation of intercollegiate athletic contests, and your expressed hope that the government of that institution will, without delay, take the lead in discontinuing them. Harvard can afford to do this, and, whatever other colleges may do, she will gain in students, in scholarship and usefulness.

Apropos of this. The other evening there happened to be present together here several persons, some of them old Harvard graduates, who were discussing the present status and tendency of Harvard student life, and its influence upon the future usefulness of her alumni. Much feeling was exhibited and surprise expressed at the timidity or supineness shown in dealing with this acknowledged and serious evil, which compels parents who have knowledge on this subject, and take an intelligent interest in the welfare of their sons, to choose some of the smaller colleges for their education, much as they would prefer Harvard on account of the better facilities and the more liberal and rational system of elective studies obtaining there.

H S.

Washington, D. C., February 13, 1888.

A SMALLER BLAIR EDUCATIONAL ACT WANTED.

To the Editor of The Nation:

Sir: Will you let me call your attention and that of your readers to a state of affairs which demands the action of Congress, and in the meantime the notice of the charitably disposed? It presents a legitimate field of action for a "small educational bill" for a small section of the South on the part of the general Government, and one concerning which there seems to the writer no reasonable objection that can be offered.

The Navy-yard at Pensacola, Florida, now virtually closed, is situated upon a tract of land known as the Naval Reservation, belonging to the general Government, and including in its entire limits an area of over 4,000 acres. There is living upon this tract a population of nearly 1,500 souls, tenants at the will of the Government, with few exceptions wretchedly poor, and with over 400 children, of the proper

age for school, about equally divided between whites and blacks. For these children no school facilities exist. The parents are too poor to afford any teachers, the State of Florida has no jurisdiction over the districts (the inhabitants not being legally citizens of the State), and the Navy Department has no funds that can be used for this purpose. The larger majority of the younger married people have grown up without school advantages, and are deplorably ignorant and helpless. The people are attached to their homes, and will not willingly move, and their occupations as pilots, fishermen, and occasional laborers at the Navy-yard and elsewhere afford them no more than a bare existence.

The Bureau of Education has no funds at its disposal for any such purpose, and there seems no relief possible unless Congress acts. A bill is to be introduced for the purpose of making a provision of facilities for elementary education; and in the meantime a school-room can be temporarily arranged at the Navy-yard, if donations can be given for the pay of teachers and provision of books. Any donations sent to Surgeon J. W. Ross, U. S. N., at the Navy-yard, Pensacola, Fla., will be properly applied for this purpose. C. H. S.

WASHINGTON, D. C., February 9, 1888.

THE BACK-TRACK IN EDUCATION.

TO THE EDITOR OF THE NATION:

SIR: The world does move backward sometimes and in some places, and here we have a specimen in the shutting of the doors of Adelbert College to women. Women had enjoyed the privileges of the institution for some fifteen years. They had proved themselves equal in all respects to the men, and, if we may judge from the number of honors they have taken, their scholarship has been of a much higher average. They must have enjoyed better health than the men, as their absences from college exercises have averaged rather less than half as many as those of the men, it is said. There have been no flirtations, no giddiness, no nonsense of any sort on their part. The women have been of the highest character, from excellent families, who went to college because they desired to study and to know. They had come to be well treated by their fellow-students, and it is thought that it would never have been otherwise had not the Faculty, by their obvious hostility to the women, set the men against them for a time in 1884, so that their situation was made very uncomfortable for a year or so. But this had passed away, and everything was going well with them.

The President of the College through whose agency the women had been first admitted, and who had been their firm friend, resigned in 1886, and the trustees had accomplished nothing in eighteen months towards filling his place. They claimed that the presence of women in the college made it impossible for them to secure any fit man for the presidency. No doubt this did embarrass them. They had two embarrassments, in fact, either of which might well have appalled very able and brave men. It had been repeatedly given out in the newspapers, and in private conversation by the trustees, that the trustees were determined that the new President must be a distinguished political economist who would teach the *doctrine of high protection to American industry*. That was embarrassment number 1. The new President must also be a *man who would turn out the women*—embarrassment number 2.

One would think it would be hard to find a capable man who would unite these two qualifications. But they found their man at last in the person of a Presbyterian clergyman of the city of thirty years' standing. Neither the trustees nor the President had condescended to offer any argument in favor of turning out the women. In 1884, when the Faculty memorialized the trustees in favor of this measure, the trustees appointed an able committee who scoured the whole country for facts, opinions, and testimonies on the subject. The result was a strong report and a strong vote in favor of continuing the privileges of the College to women. Not an argument was then urged from any quarter for turning out women which would receive a moment's consideration from any intelligent man. The only things which looked like arguments were, that there were some passages in Greek and Roman writers which the professors felt embarrassed in reading before women, and that there was danger that so many women would come that the men would be scared away, and Adelbert would become a woman's college. But it did not require even such arguments to enable the changed Board of Trustees and their new President to go ahead with their scheme.

Cleveland has upwards of two millions of dollars invested in higher education in Adelbert College and Case School of Applied Science. But no woman may longer receive any benefit from these endowments, though there are less than a hundred men in the two schools. A LOOKER-ON.

CLEVELAND, O., February 4, 1888.

CASES IN POINT.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent "C. C. N." (Feb. 2, 1888, p. 93) calls for "instances where the observing faculty of Darwin brought him false information." Well, "C. C. N." himself claims that Mr. Darwin's observation of the effect that classical education had on his observing and reasoning faculties brought him false information.

"C. C. N." asks, "Who is that naturalist, philosopher, or scientist, who, having been trained in early life by means of a scientific or optional system of education, developed in after life a better working mind than Mr. Darwin's?" In the same number of the *Nation* in which this inquiry is made appears a lengthy estimate of the life and work of Prof. Asa Gray, who, while perhaps not possessing a "better working mind than Mr. Darwin," is yet a sufficiently good example of non-classical education to satisfy those who do not believe that a classical training is positively necessary in order that a person may become a close observer, a correct reasoner, and a clear and forcible writer.

Respectfully, E. G. S.

ALBANY, February 13, 1888.

REDEEM THE GREENBACKS.

TO THE EDITOR OF THE NATION:

SIR: Of the many methods proposed for disposing of the Treasury surplus, none seem to me so entirely satisfactory for present purposes as would be the final redemption and cancellation of the unsecured paper currency of the country. The withdrawal of the Government notes would at this time create no contraction of the currency, as every dollar redeemed would be replaced by a coin dollar otherwise lying idle in the Government vaults. If it be objected that the people prefer the convenience of the paper currency, answer can be made that instead of issuing the actual coin in redemption of the greenbacks, silver certificates could be used. The redemption of the greenback currency would be one step towards the simplifying of our monetary system, which is now unnecessarily complicated; and, with these notes out of the way, the Government credit would be much stronger in the event of its again becoming a borrower.

As the *Nation* has not, I think, advocated this course, I presume there are objections to it which I believe its readers would be glad to learn.—Very respectfully, "PENMAN."

PHILADELPHIA, January 30, 1888.

[Secretary Manning recommended this disposition of the Treasury surplus in one of his annual reports. One hundred millions of gold is held as a reserve against $350,000,000 of greenbacks. Consequently there would not be a coin dollar for every greenback dollar redeemed. But in course of time there would be a specie certificate, gold or silver, in circulation for every greenback returned, or, at all events, as many as the business of the country should call for.—ED. NATION]

WAGES VS. PRICES.

TO THE EDITOR OF THE NATION:

SIR: In to-day's Philadelphia *Press* I find the following extract from the St. Louis *Globe-Democrat*:

"A statement of the relative wages paid in a woollen mill employing 221 hands in Providence, R. I., and a mill of the same kind and size in Bradford, England, shows over 100 per cent. in favor of the American operatives. It is by such figures as these that the arguments of the free-traders in this country are easily and conclusively refuted."

Is it necessary to say that the mere comparison of wages in the United States with wages paid in Great Britain and other countries, without a knowledge of the purchasing power of such wages, but lead astray those interested in the comparison? As Great Britain obtains beef, bread, cotton, etc., from this country, and yet retails the same at less cost to her working people than the working people in this country can obtain them, why not give the prices paid for them in London, Boston, New York, Philadelphia, etc., and thus enable the great body of voters to intelligently decide for themselves whether their interests lie in an exorbitant tariff tax or a safe and fair inducement for the employment of capital in manufactures, etc., and not be led astray by the cry of pauper labor in Europe?—Respectfully yours,

WAGES.

BETHLEHEM, PA., February 10, 1888.

POST-REVOLUTIONARY MOVEMENT OF SLAVES SOUTHWARD.

TO THE EDITOR OF THE NATION:

SIR: In your paper of January 26, p. 75, in criticising a letter from Washington on the condition of our negro population, which appeared in the *Frankfurter Zeitung* of December 24, 1887, some of your statements are incorrect. The correspondent writes "that the civil war was a struggle between the sons of slave-owners and the planters to whom their fathers had sold their dark commodities." In commenting on the above and following passage, you wrote:

"This is a corollary to the misleading statement that 'in 1790 the negroes were distributed throughout the country, and were almost exclusively slaves,' but that 'during the first quarter of the century the inhabitants of the Northern States gradually sold their slaves to the South, where climate and the nature of the agricultural products increased the value of negro labor'—all of which sounds as if this countryman of Von Holst had drawn his facts from the pro-slavery pamphlets of Buchanan's Administration. The results of his observation, however, are better than those of his reading."

After quite a thorough study of this question

a few years ago, I came to the conclusion that there had been such a trade in negroes, and that it was known to exist by the people at the North during the period of gradual emancipation. For example, in the Philadelphia *Union* of August 7, 1818, I found the following:

"SLAVE TRADE.—The brig *Bliss*, Captain French, with 39 human beings on board doomed to abject and ignominious slavery, left Perth Amboy on Saturday morning at daylight. It is understood that they will be landed above New Orleans, near Baton Rouge, at a plantation belonging. . . . The citizens of Perth Amboy and New Brunswick ought not to have permitted this shocking trade in their vicinity."

In *Niles' Register*, February 8, 1817:

"Some inhuman speculator at New York has disburthened the prison of that city of 70 or 80 negroes by procuring their imprisonment to be commuted for transportation. . . . The corporation has very properly ordered the vessel containing this gang of thieves to proceed without the limits of the city."—*New Orleans Paper.*

In Court of Errors of New Jersey, 2 Halsted Reports, case of Gibbons vs. Morse, November Term, 1821—testimony of Richard Adams: ". . . that Wm. Stone was engaged in purchasing negroes that season; . . . saw near 50 negroes on board vessel at South Amboy . . . Van Ort also purchasing blacks; . . . they were with the negroes that were destined for New Orleans; that John C. Marsh also was engaged in buying negroes, . . . there were two or three cargoes of negroes sent off that season."

It was charged in the case of the *Mary Ann*, 8th Wheaton, p. 380, Supreme Court of the United States, that the vessel had 36 negroes on board from New York and Perth Amboy for New Orleans. This case was decided on the pleadings.

The following extract is from a letter of a member of the New Jersey Legislature to a clergyman in Baltimore, printed in the Baltimore *American* of November 11, 1818:

"NEW BRUNSWICK, Nov. 7th, 1818.

"DEAR SIR: I am here on my way home from attending the Legislature, which have passed a bill to stop the inhuman traffic in colored persons from this State. There were 14 or 15 of these unhappy blacks at South Amboy which the villains could not get off by water in time to escape the new law, but, having notice of it, they took them in waggons across the State towards Pennsylvania with a view to get them to Maryland."

But even more convincing than these concrete cases are the expressions of the Legislatures of the different States. In 1786, in Vermont, there was passed an act entitled "an act to prevent the sale and transportation of negroes and mulattoes out of this State." The seventh section of the Rhode Island act of 1798 is: "Courts may allow unfaithful slaves to be transported to any part of the United States." New York in 1788, 1802, 1808, 1817, and 1819, and New Jersey in 1798, 1812, 1818-'19, 1820, passed laws against the sale of negroes out of their boundaries. If these laws had not been violated, there would have been no necessity for changing them.

Proof that quite a number of negroes were exported from the North is also found in the United States census reports. Take New York:

In 1790 total colored population was	25,978
In 1800 " " "	31,320
In 1810 " " "	40,350
In 1820 " " "	39,367
In 1830 " " "	44,945

Why was there an actual decrease of 2½ per cent. for the decade 1810-1820, when for the ten years preceding there had been an increase of 35 per cent.? That the New York negroes did not go to the other Northern States is evident from the following table:

In 1790 total colored pop'n in Northern States...	66,957
In 1800 " " " "	82,248
In 1810 " " " "	101,268
In 1820 " " " "	109,795
In 1830 " " " "	109,773

Free negroes were prohibited from entering the Southern States. They could not have gone to Hayti, Liberia, or Upper Canada, for these colonizing enterprises were not at that time in operation. The Western States had but a handful of negroes, and these probably came from Virginia. To the South, then, several thousand negroes must have gone as slaves.

LEIGH BONSAL.

BALTIMORE, February 3, 1888.

[The evidence adduced by our correspondent is interesting, but it seems to relieve the people of the North as a whole of the charge intimated by the correspondent of the Frankfort *Gazette*. It shows, what might have been expected, that gradual emancipation offered a great temptation to speculators to profit by the higher market in the adjoining slave section; but also that this traffic, made easy near tide-water, had to be carried on surreptitiously and under the ban of public opinion, and was restrained up to the last moment by successive statutes in token of the good faith of the emancipation acts. As for the United States census statistics concerning the blacks under our slaveholding régime, we regard them as worthless in a discussion of this kind.—ED. NATION.]

DONNELLY ANTICIPATED.

TO THE EDITOR OF THE NATION:

SIR: As the announcement is made that Mr. Donnelly's long-expected book is soon to appear, we shall doubtless very soon see the sprouting of a plentiful crop of decipherers; indeed, the rage for elucidating mysteries that do not exist, and for finding literary mare's-nests, may threaten the popularity of Buddhism and Browningitism. As a promising subject on which the novice in deciphering might try his eyes, let me recommend 'A Tale of a Tub,' in which Swift, foreseeing the possibility of Donnellys in the future, has actually given this clue to them. I wonder that the passage has not been quoted before:

"Night being the universal mother of things, wise philosophers hold all writings to be fruitful in proportion that they are dark; and, therefore, the true illuminated (that is to say, the darkest of all) have met with such numberless commentators, whose scholastic midwifery has delivered them of meanings that the authors themselves never conceived, and yet may very justly be allowed the lawful parents of them; the words of such writers being like seed, which, however scattered at random, when they light upon a fruitful ground, will multiply far beyond either the hopes or imagination of the sower.

"And, therefore, in order to promote so useful a work, I will here take leave to glance a few innuendoes that may be of great assistance to those sublime spirits who shall be appointed to labor in a universal comment upon this wonderful discourse. And, first, I have couched a very profound mystery in the number of 0's multiplied by seven and divided by nine. Also, if a devout brother of the rosy cross will pray fervently for sixty-three mornings, with a lively faith, and then transpose certain letters and syllables, according to prescription, in the second and fifth section, they will certainly reveal into a full receipt of the *opus magnum*. Lastly, whoever will be at the pains to calculate the whole number of each letter in this treatise, and sum up the difference exactly between the several numbers, assigning the true natural cause for every such difference, the discoveries in the product will plentifully reward his labor." (A Tale of a Tub, section x.)

Swift discloses so much of the secret that an adept decipherer like Mr. Donnelly will not condescend to so simple a puzzle; but it is to be hoped that some of his callow disciples will work it out. Then by easy stages they can pass up to higher achievements, such as proving that Galileo wrote the 'Divine Comedy,' or Darwin 'In Memoriam.'

WILLIAM R. THAYER.

CAMBRIDGE, MASS., February 6, 1888.

DR. SPARKS AND THE WASHINGTON LETTERS.

TO THE EDITOR OF THE NATION:

SIR: Your last issue (p. 117) refers to an article by Mr. W. H. Smith in the *Magazine of American History*. In this article he gives examples, to borrow your words, of "the sickening way in which Jared Sparks tampered with Washington's private letters." These examples are drawn from the correspondence of Washington with Col. Bouquet, which forms one of the numerous volumes of the Bouquet and Haldimand collection of manuscripts in the British Museum. Some years ago I had the whole of this volume carefully copied, and gave the copy to the Massachusetts Historical Society, in whose library it now is. I had previously collated the letters with the letters purporting to be the same, published by Dr. Sparks. Great differences appeared, but it seemed to me evident that they were not in general due to changes made by the editor. The letters in the British Museum are in Washington's own handwriting. Dr. Sparks could never have seen them. It was not till long after the publication of his 'Writings of Washington' that the Bouquet and Haldimand papers, hitherto unknown, were discovered and purchased for the British Museum by its agent, the late Henry Stevens of Vermont. Dr. Sparks must have printed the letters, not from the autographs, but from drafts entered by a secretary in Washington's letter books.

Dr. Sparks says in his preface: "It was Washington's custom in all his letters of importance first to write drafts, which he transcribed. In making the transcripts he sometimes deviated from the drafts, omitting, inserting, and altering parts of sentences; nor did he always correct the drafts so as to make them accord with the letters as sent to his correspondents. These imperfect drafts were laid aside and from time to time copied by an amanuensis into the letter-books. . . . For the reasons here mentioned, it is probable that the printed text may not in every particular be the same as in the originals—that is, the corrected copies which were sent to his correspondents." He adds that this is especially true of Washington's earlier private letters, including those written during the French war. In this category are the letters to Bouquet.

It is true that the above does not explain all the variations from the original which may be found in Dr. Sparks's edition of the 'Writings of Washington.' He was the most scrupulous of men, but, as an editor, he fell into serious errors of judgment, due largely to the fact that when his work was in preparation the functions of the editor of historical documents were ill-defined, and notions of his duties were entertained widely different from those which happily prevail now. Dr. Sparks, too, had views of his own touching his duties and responsibilities. He once told me that in publishing Washington's letters he felt himself bound to correct their errors and put them into the form in which the writer himself would have wished that they should appear before the public. He was convinced that he ought to suppress anything that was ungrammatical, undignified, or

in any way ill suited for publicity. So, for example, when Washington wrote "Old Put," he made him write "Gen. Putnam." Nobody will now deny that these changes were most unfortunate, but nobody who knew Dr. Sparks will doubt for a moment that, mistaken as they are, they were made in the most conscientious good faith. FRANCIS PARKMAN.

BOSTON, February 11.

Notes.

'TAXATION IN AMERICAN STATES AND CITIES' is the title of a work to appear next month from the press of T. Y. Crowell & Co. The author is Prof. Richard T. Ely of Johns Hopkins, a member of the Maryland Tax Commission.

'Harvard Reminiscences,' by the Rev. Andrew P. Peabody; 'On Society, Literature, and Politics,' essays by the late E. P. Whipple; and 'The World's Verdict,' a novel by Mark Hopkins, jr., will be published directly by Ticknor & Co., Boston.

G. P. Putnam's Sons announce 'The History of the Town of Fairfield, Conn.,' by Elizabeth H. Schenck; 'The Story of the City of New York,' by Charles Burr Todd; 'The Story of the Thirteen States,' by Helen Ainslie Smith; 'The Story of Holland,' by J. E. Thorold Rogers; 'Charles Sumner and his Work,' by his former private secretary, A. B. Johnson; 'Hints from a Lawyer; or, Legal Advice to Men and Women,' by Edgar A. Spencer; 'A Hard-Won Victory,' by Grace Denio Litchfield; and 'Lajla,' a story from the Norse, translated by Ingerid Markhus.

'Judith,' an Old English epic fragment, edited by Prof. Albert S. Cook; and Schiller's Ballads, edited by Prof. Henry Johnson, with variants and notes, the text based on Goedeke's, will be published by D. C. Heath & Co., Boston.

Ginn & Co. issue immediately 'An Epitome of Anatomy, Physiology, and Hygiene,' including the effects of alcohol and tobacco, by H. H. Culver; and 'The Modern Distributive Process: Studies of Competition and its Limits, of the Nature and Amount of Profits, and of the Determination of Wages in the Industrial Society of To-day,' by John B. Clark and Franklin H. Giddings.

J. B. Lippincott Co. have in press 'Stanley's Expedition for the Relief of Emin Pasha,' compiled from his letters by M. Wauters; 'Half-Hours with the Best Foreign Authors,' in four volumes, by Charles Morris; 'The Merchant of Venice,' being the seventh volume in Horace Howard Furness's Variorum Edition of Shakspere; a 'Cyclopædia of Diseases of Children, and their Treatment, Medical and Surgical,' by Dr. J. M. Keating; 'Pleasant Waters,' a story of Southern life and character, by Graham Clayton; and 'Over the Divide, and Other Verses,' by Marion Manville.

A. C. McClurg & Co., Chicago, have in press for early publication 'Witnesses to Christ; a Contribution to Christian Apologetics,' by William Clark, M.A., Professor of Philosophy in Trinity College, Toronto.

Houghton, Mifflin & Co. announce the next issue in their series of "American Statesmen" to be Mr. Roosevelt's volume on Gouverneur Morris. They have also in preparation a 'Life of Amos A. Lawrence,' by his son, the Rev. William Lawrence; and 'Reincarnation,' by E. D. Walker, who treats in a popular way the doctrine of metempsychosis.

'Black Ice,' by Judge Tourgée, will shortly be issued by Fords, Howard & Hulbert.

There are, either in the press or in the course of preparation, a number of important works on Africa by English, French, and German authors. Among the latter are the following to be published by Brockhaus: 'In the Interior of Africa, or Explorations of the Kassai during the Years 1883-85,' by Wissmann, Wolf, Von François and Mueller; 'The Exploration of the Tschuapa and Lulongo,' by Kurt von François, in which are related his journeys with the Rev. Mr. Grenfell; and 'The Sudan under Egyptian Rule,' with an Appendix containing letters of Emin Pasha and Lupton Bey to Wilhelm Junker during the years 1883-85. This last, edited by Dr. Richard Buchta, forms a supplement to 'Emin Pasha's Letters,' also to be published by Brockhaus, and to which we have already referred in these columns.

The February list of Wilhelm Friedrich, Leipzig, includes 'El Dorado,' by F. A. Junker von Langegg, a history of gold-seeking in northern South America in the sixteenth and seventeenth centuries; 'Tunis und seine Umgebungen,' by Schrenck-Notzing and Dr. Kleist; 'Die Andessprachen in ihrem Zusammenhange mit dem semitischen Sprachstamme,' by Prof. Rudolf Falb; the second volume of Schweitzer's 'Geschichte der Skandinavischen Litteratur;' a metrical version of the complete works of the Russian poet Nekrasoff; 'Goethe's Werther in Frankreich,' by Ferdinand Gross; 'Psychologische Studien zur Sprachgeschichte,' by Dr. Kurt Bruchmann, in intimate relation to which is Dr. Rudolf Kleinpaul's 'Sprache ohne Worte'; 'Die Spartanische Verfassung bei Xenophon,' by Dr. Bruno Fleischanderl; 'Das Verhältniss des Neugriechischen zu den Romanischen Sprachen,' by Hans Müller; and 'Hellenisch, die allgemeine Gelehrtensprache der Zukunft,' by Dr. August Boltz—a recommendation of Greek as a savants' world-language.

Volapük is making steady progress, though not so great as some of its more ardent promoters would lead us to believe. At the annual meeting of the French association for its propagation, the secretary stated that in his opinion the number of disciples should not be reckoned at more than 40,000, which is about the number of dictionaries sold. It has been placed as high as 200,000. Some French, German, and Italian business houses put at the head of their letters "Spodobs Volapüko" (we correspond in Volapük), but none of the great houses have yet done this. The language has now 13 journals and 172 societies, an increase of 67 during the year, while public courses of instruction are given in such widely separated places as Tiflis in the Caucasus and Salt Lake City, as well as in the universities of Munich and New Orleans. An Arabic grammar and a Japanese dictionary in Volapük are about to be published. Out of 181 students who applied for examination in December, 116 took the diploma *Spodal* (*correspondant volapükiste*). An *Annuaire Général* of Volapükists will be published as soon as 20,000 addresses have been received, the number now being nearly 15,000. The President's address closed with the announcement that a great international congress was to be held in Paris in 1889, and that a Volapükaleür, or Bureau of Information, had already been opened in the Boulevard Montmartre.

A French version of Mrs. Burnett's 'Little Lord Fauntleroy,' called 'Le Petit Lord,' by Eudoxie Dupuis, has recently been published in Paris with Mr. Birch's original illustrations. As the French law makes no distinction of persons, allowing copyright to a foreigner as to a native, it would be well for all writers of juvenile books to secure themselves in France.

The eclectic translation of Hugo's poems has been followed in Bohn's Library by the 'Dramatic Works of Victor Hugo,' translated by Frederick L. Slous and Mrs. Newton Crosland (London: Bell; New York: Scribner & Welford). Of Hugo's many plays but three appear in this volume, "Hernani" and "Ruy Blas," translated by Mrs. Crosland, and "Le Roi s'amuse," by Mr. Slous. Hugo's prefaces are also rendered into English. Perhaps these three plays are best adapted to make the French dramatist's merits plain to English readers. "Ruy Blas" (with the excision of the fourth act and of the character of *Don César*) still holds our stage; Mr. Lawrence Barrett not long ago attempted an ill-advised revival of the old Macready version of "Hernani"; and Mr. Booth is often seen and to great advantage in the "Fool's Revenge," which Tom Taylor adroitly carpentered out of "Le Roi s'amuse." The mastery of stagecraft displayed in "Ruy Blas" and "Hernani" is easily visible through the translation; and the clumsiness of the conduct of the intrigue in "Le Roi s'amuse" is as plainly apparent. The lofty language, the marvellous vocabulary, the lyric elevation, the perfervid picturesqueness of speech, which, in French, may almost veil the psychologic feebleness of the characters, cannot possibly be reproduced in English. The task is hopeless, and no one can be blamed for failure. A comparison of the blank verse of Mrs. Crosland and Mr. Slous with the original Alexandrines shows that the translators have done their work carefully and conscientiously.

We have received the first volume of the edition of Shakspere to which Mr. Irving has lent his name ('The Works of William Shakespeare, edited by Henry Irving and Frank A. Marshall, with Notes and Introductions to each Play by F. A. Marshall and other Shakespearian Scholars, and numerous Illustrations by Gordon Browne.' New York: Scribner & Welford, 1888). Mr. Irving's part seems to consist only of a brief essay upon Shakspere as a playwright, which does no more than affirm that he was one and honored his own profession. The introduction to each play is short, but sufficient, and contains a sketch of its literary and stage history and an estimate of its character, slightly but firmly done. At the end of each play is a body of verbal notes, explanatory and illustrative, and copious enough for all readers. To this is added a list of the words used only once in the play, and of the few emendations adopted or proposed. The volume is well printed, and bold type is used for the catchwords of the notes and elsewhere, to the convenience of the student. The illustrations are poor. The editorial work is well grounded and its spirit admirable. The plays in this volume are "Love's Labor Lost," "Two Gentlemen of Verona," "The Comedy of Errors," "Romeo and Juliet," and "Henry VI., Pt. I."

The reprint of Sir Henry Thompson's essay in the *Nineteenth Century* for May, 1885, on 'Diet in Relation to Age and Activity,' which was commended in No. 1111 of the *Nation*, has been issued anew from the tenth English edition by Cupples & Hurd, Boston. We hope its circulation may yet be increased ten-fold for the public good.

We were glad to speak of Dr. Jerome Walker's 'Anatomy, Physiology, and Hygiene' for schools as almost faultless. The same author has prepared 'Health Lessons: A Primary Book' (D. Appleton & Co.), to which similar praise may be given. It is for the entertainment and instruction of young children in a method that is novel, and with an execution that is admirable. The motive is, temperance is health, but there is no preaching, and the

doctrine is imperceptibly absorbed by the little readers along with the elementary physiology and the pleasant talks about children's dolls and their daily doings.

The venerable Dr. John S. Butler, late Superintendent of the Connecticut Retreat for the Insane, has just published (Putnams) a little essay on the 'Curability of Insanity' that appeals quite as strongly to laymen as to physicians. Inasmuch as in 1844 there were not 2,700 inmates of lunatic asylums in the United States, and as in less than forty years afterwards there were nearly 52,000 such patients, while it is estimated that more than one person in 550 is so afflicted, or that the total number is 92,000, the importance of the subject may be appreciated. The essence of Dr. Butler's teaching is that individualized treatment is as necessary in insanity as in any other disease, and that its exercise is limited, as all personal effort must be, by the number that can be personally reached. Dr. Butler firmly believes that strictly recent insanity is in many cases radically curable, and to that end he combines many moral elements with those agencies that are more commonly known as medical, prominent among them being the higher form of home-life so utterly unattainable in the vast institutions where the inmates are herded in crowds. There are ten hospitals in this country where the insane patients range from 1,000 to 1,800. We cannot follow here Dr. Butler, writing from fifty years' knowledge of his subject, but we commend him to all who will give an hour to learning about their unfortunate fellow-men. One remark, however, must be quoted, for to many it will awaken a new train of thought: "In many of the insane the power of observation is active, and the understanding has a considerable range of exercise, while the affections exist as warmly and the sensibility is as acute as in a state of perfect mental health." And this applies to the chronic and incurable cases as well as to those approaching restoration.

The *Curio* puts out a double number for January and February, which has an interesting New York paper, by John Preston Beecher, on Poe, illustrated by cuts of all the houses in which Poe is known to have lived in this city. He frequently changed his lodgings, and so we have five cuts of the humble domestic architecture of 1845. The sketch is unfavorable to Poe, and goes to show that Griswold told the substantial truth of the matter in his much-maligned memoir. Mr. Beecher adds a few anecdotes to the further discredit of Poe, but it is the part of charity to refrain from quoting them, especially as he has them by hearsay, though only at one remove. Among the other contents we note the pedigree of the Appleton family.

Madame de Pompadour is handsomely dealt with as a bibliophile and as an artist and art patron by M. Gustave Pawlowski in *Le Livre* for January. He both uses and supplements the biography by the brothers Goncourt (of which a magnificent illustrated edition was brought out by Firmin Didot during the holidays), and the 'Femmes Bibliophiles' of Quentin-Bauchart — surpassing the latter in particular by a tolerably minute analysis of the 8,000 volumes which formed the library of the royal favorite. He recalls to her credit her founding of the École Militaire and of the Sèvres factory, the protection she gave to the savants and men of letters before the Revolution. She was passionately fond of the theatre; being "musicien exquise, cantatrice adorable, danseuse ravissante, artiste dramatique," herself. She did not waste fine bindings on the novels in her collection, which were commonly merely stitched or simply bound in calf or in vellum. She practised engraving in *eau-forte*. La Tour's charming pastel of her in the Louvre, never satisfactorily engraved, is here reproduced in photogravure, in a blue monochrome. The accessories of the portrait illustrate the side of her character dwelt on by M. Pawlowski.

A third *livraison* was added last year to the 'Bibliographie des travaux historiques et archéologiques publiés par les Sociétés savantes de la France,' by Robert de Lasteyrie and Eugène Lefèvre-Pontalis, issued under the auspices of the Minister of Public Instruction. Arranged in an alphabet of the departments of France, this part reaches into the letter G (Garonne, Haute). The 552 quarto pages so far published, therefore, can scarcely embrace more than one-fifth of the probable volume of the completed work, for the publications of the learned societies of Paris (which amount to about 22 per cent. of the total number of French academies) still remain to be included in the work under the Department of the Seine. The titles of the articles recorded to the end of part 3 number 17,375. The fourth part, which is promised to appear soon, will include the Department of Hérault, and will complete the first volume. In the eyes of the American bibliographer there is a sad waste of space in this work, in that the name of any publication of a society is repeated for each volume that has been printed. This useless repetition is especially noticeable in cases where for several pages in succession there are no entries of contents under any of the volumes of a series, but for each volume the title is reprinted in three or four lines of type, the only difference between the entries being in the number of the volume, the date, and the pagination, which differentiation could have been readily and clearly expressed in from one-half to one line of type. This waste of labor and expense could have been better utilized in preparing and printing temporary indexes (to accompany each part) to the thousands of valuable historical and biographical references contained in the work, which now are practically not available because of the peculiar arrangement of the book, nor will they be until the completed work is followed by an exhaustive general index. Each part is furnished by Hachette & Cie., Paris, at a price of four francs.

The Greek Government is considering the plans for two new museums in Athens—one a museum of casts, to serve as an annex to the Central Museum, on the Patissia Road, the other a second museum on the Acropolis. The first of these, if well carried out, will be invaluable to students in Athens as a means of comparing the sculptures there with the Greek works scattered among the various European collections. The second is rendered necessary by the large number of fragments discovered recently on the Acropolis, with which the present museum is now overcrowded. We understand that only objects of secondary importance are to be placed in the new building; but we are decidedly of the opinion that it would be wiser to clear the Acropolis entirely of modern structures, centralizing the objects discovered there in a department of the Central Museum which could be devoted exclusively to them.

Among the fragments recently discovered in the excavations at the eastern end of the Acropolis is a marble head, which is said to bear a striking resemblance to the head of the Apollo in the western pediment of the temple of Zeus at Olympia. Those who believe the sculptures of that temple to have been the work of Athenian artists regard this discovery as important evidence in their favor. In the northwestern part of Athens, near the road leading to the Academy, six graves were recently discovered while workmen were laying gaspipes. These seem to be of the Roman epoch, but are apparently richer in contents than the majority of graves of that epoch in Athens, as the slight description received speaks of various small objects in gold and glass, ten lekythoi, a terracotta figure, etc.

The little harbor of Zea, which will be remembered as one of the stations for ships of war at the Piræus, is to be dredged and surrounded by a wall or embankment. In its present condition this harbor is of little or no service, as its entrance is so shallow and rocky that only small boats can pass through; yet it is one of the most interesting and instructive bits in the whole peninsula of the Piræus, partly because of its picturesque shape and position (it being an almost perfectly round bowl with steep sides and a narrow opening which looks directly down the Saronic gulf), but principally because around its sides are still to be seen the old stone ways, slanting down under the water, on which the ships of war were drawn up and housed. Whatever good may come of the new work, the wall is certain to spoil the character of the spot, and its builders will hardly be able to resist the temptation which the great stone blocks, already cut and at hand, offer them.

—A popular little treatise on 'Weather' (Appletons) has lately been prepared by the Hon. Ralph Abercromby, in which the intelligent reader will find much of interest and information concerning a subject that, like a few others, is always with us. Mr. Abercromby has for some years made the weather of Great Britain a special study, and has recently extended his experience by making a meteorological tour around the world. As a fruit of this preparation, he gives us a book that is to be commended for its simple, deliberate style, freedom from technicality and unnecessary theorizing, rational description, classification, and explanation of atmospheric phenomena, and rich store of illustration from the weather maps of many parts of the world. Great Britain naturally has the larger share of the book, but the weather of our own country is also described and illustrated in good proportion, entirely sufficient to warrant a careful reading of the whole on this side of the Atlantic. On the other hand, the less satisfactory parts of the book are the occasional lapses into an irrational classification, as of anti-cyclones; the presentation of certain insufficient explanations, as of cyclones; and on the whole an old-fashioned conservatism, characteristic of nearly all British meteorologists, as evinced in a timid treatment of several well-founded theoretical explanations, which might have a more careful consideration in a work that "endeavors to explain the general principles involved" in the science of the weather. Still, the book is a good one, and will find much more of welcome than of criticism. It would do an immense amount of good if it were read by all members of those two not insignificant fractions of the community—the ignorantly pious who pray for rain in a time of drought, and the ignorantly credulous who follow the predictions of the various Wigginses of the country; for the chief teaching of the book is that weather is governed by natural, and in great part discoverable, forces, like everything else.

—The first number of the Cornell University *Studies in Classical Philology* is Professor Hale's pamphlet on the "*Cum*-constructions; their History and Functions. Part I. Critical." In this essay Professor Hale belabors the

Hoffmannian doctrine of absolute and relative time with the same doughtiness and downrightness, the same familiarity of illustration and fervor of diction, and (candor compels us to say) unnecessary expenditure of words, that characterized his previous onslaught on the Sequence of Tenses. This absolute and relative theory has been sedulously propagated in this country by certain popular Latin grammars, and although the doctrine has not won universal acceptance, and in fact has been vigorously objected to by Professor Fischer in his elaborate article on *cum* in 'Harpers' Latin Dictionary,' still Professor Hale has felt himself called on to do battle against it, and rid the grammatical territory of it for ever. Certainly, whatever grain of truth the theory may have in it, the nomenclature is extremely unfortunate. If *cum* with the subjunctive had been called the circumstantial *cum* or the characteristic *cum*, and the old *cum* causal had been sent to the right-about, one might have seen analogies in the circumstantial participle, which runs parallel with the subjunctive *cum*-constructions, and in the relative of characteristic with its potential subjunctive, and one might have said with Coleridge, "Like most Germans [Hoffmann] is not altogether wrong, and like them also is never altogether right." But "absolute" and "relative"—why, there is no such thing as absolute time; and to call absolute time that form of relative expression which insists so often on correlation (*tum . . . cum*), ought to have been a trial of faith to any one except those American grammarians whose standard of excellence is the immediate incorporation of the latest German theory. But there is no novelty about "absolute" and "relative" now, and Professor Hale has been at the pains of hunting these spectres up hill and down dale—Hoffmann's original statement, Lübbert's historical justification of Hoffmann, and Hoffmann's indignant rejection of Lübbert's justification of him—until one becomes somewhat weary of "das Seiende" and "das Nichtseiende," and "the transmutation of an aorist" into "a subjectively posited present completeness." However, that is not Professor Hale's fault, but the fault of the Germans, and the essay ends happily. *Conclusum est contra Hoffmannianos*, and for all this "scholastic metaphysic" we are to have in Professor Hale's next paper the constructive part, and it takes no prophet to tell that we are to be delivered from the bondage of those two fiends Absolute and Relative by the same heavenly maid, Parataxis, to whom we owe our riddance of the iron yoke of the Sequence of Tenses.

—Of more interest to the general reader is the second number of the same series, "Analogy, and the Scope of its Application in Language," by Benjamin Ide Wheeler, in which the Professor of Comparative Philology in Cornell has undertaken to present "a coherent classification of the generally recognized products of the action of analogy on language." Professor Wheeler, being a neogrammarian, claims for his school the development of the method; for while the method itself is as old as grammar, while συνεκδρομή and assimilation are not of yesterday, "the doctrines of analogy arose as the complement to the doctrine of the strict order in phonetic development"; and what sober-minded people, who do not object to the use of analogy in moderation, have considered to be the danger of the resort to analogical stimulant whenever phonology resists the digestive process—this is considered by Professor Wheeler not a danger, but a duty. "The investigator of the history of forms must to-day make free use of analogy just in proportion as he deals strictly with the laws of sound." The neogrammatical engine is built of iron and gutta-percha. The more rigid the iron, the more elastic the gutta-percha. To our thinking, "free use" is an ill-chosen expression, unless "free use" means (what it does not always mean) "right use." That Professor Wheeler's array of illustrations is interesting, is even fascinating, every one will admit; and the cautions that he gives will, perhaps, serve to put young scholars on their guard, as the examples that he gives will certainly put them on their mettle. Of analogy in syntax little is said, for the subject has attracted fewer workers, and it is curious that Professor Wheeler's colleague, Professor Hale, does not seem to allow the same play to the influence of analogy that might have been expected from his neighborhood.

—Next May the Royal University of Bologna (Università degli Studii, as its title is in all the old documents) will celebrate its Eighth Centenary. It has some claims to being the oldest University in Europe, for it is said to have been originally established by the Emperor Theodosius the younger in 425. But its present legal existence dates from the end of the eleventh century, when it began to become well known for its excellent law schools, although the great Irnerius did not flourish until the middle of the twelfth century. The date is, perhaps, not exact, but it is approximate, and has been probably chosen to add additional lustre to the Exposition and the other fêtes at the same time. Formal invitations to be represented at the Centenary have been sent by the Rector to foreign universities, including those of the United States, and it is to be hoped that our colleges will interest themselves in the *docta Bononia*, the *Mater Studiorum*, to assist at this Jubilee of a University where the Roman Law was first properly explained; where Dante and Petrarch studied; where S. Carlo Borromeo once presided; and where, in later times, Cardinal Mezzofanti was Librarian, and Galvani made his discoveries. What should be an especial attraction for some of our learned institutions is, that Bologna, up to very recent times, continued the not infrequent practice of the Middle Ages of appointing women professors. Not to go back to the great celebrities of early times, we may recall Laura Bassi (of whom there is an amusing account in the 'Lettres Familières' of the President De Brosses), who, after having been made Doctor and Professor of Philosophy, gained a great reputation as Professor of Experimental Physics, which she taught for over thirty years, until her death in 1778; Clotilda Tambroni, Professor of Greek, who, after being ousted by the Revolution, was restored to her Chair by Bonaparte in 1794; and Anna Moranda Manzolini, the latest of them all, who was Professor of Anatomy. The busts of these learned ladies still adorn the halls of the University. Bologna follows the example of most European universities in not having a permanent president, but of one elected for a year, or term of years, from among the professors. The present President is the well-known Italian geologist and naturalist, Giovanni Capellini. Among the other celebrities of the University are Count Aurelio Saffi, the survivor of the Roman triumvirate of 1849; Carducci, the poet, who is Professor of Italian Literature; Doctor Olindo Guerrini, better known as the poet Stecchetti, who is the Librarian; and the critic Ernesto Masi. The great German chemist Hofmann graduated at Bologna as a Doctor of Philology, to which study he devoted himself until Liebig persuaded him to become a chemist.

—It was not alone by the University that Bologna made good her claim to be called learned. Apart from the School of Art, which is more ridiculed by modern critics than it deserves, the Musical Academy of Bologna, of which Vernon Lee has written a charming account in her 'Studies of the Eighteenth Century in Italy,' is the most famous in Italy, and Bologna is still accustomed to influence, if not to guide, the musical taste of the country. Under the auspices of this Academy, and the Presidency of Verdi and Boïto, there will be open from May until October an International Exhibition of Music and Musical Instruments and Apparatus, both ancient and modern. One feature will be a series of concerts and operatic performances, representing the continuous history of Italian music. In some of these, ancient instruments will be used again, on which the pupils of the Academy are now diligently practising for the occasion.

—Like all the great solemnities of the French Academy, the reception of M. Gréard, January 19, had points of interest entirely unexpected, as well as others which were more obvious. The *récipiendaire* was a moralist, an administrator, a republican, and a representative of the great complex institution which is called the University. The Comte de Falloux, the member to whose seat he succeeded and whose *éloge* he was called upon to pronounce, was a Catholic, a royalist, a minister of the Second Republic, and the successful promoter of the famous "loi sur l'enseignement" of 1850 which bears his name, and which has been compared to the Edict of Nantes and to the Concordat; which is, moreover, declared by what are called the Liberal Catholics to be the most favorable law of the present century for the Church, and which was certainly the point of separation of the French Catholics of that period into two hostile parties. The Duc de Broglie, the *directeur* of the Academy, whose duty it was to welcome the new member and to reply to his address, is the representative of an old family, famous in war and diplomacy in the great days of the ancient monarchy, the head of the ministry of the "seize mai," so abhorrent to republicans, and before all else an Orleanist. The contrast in the orations of the day was as striking as in the three personalities in presence of each other. M. Gréard's *éloge* (for it is not the least admirable quality of this fine address that it should be in reality a eulogy of the predecessor who differed from him so essentially in opinions and beliefs and aspirations) is written with simplicity and moderation of thought and of language, but with a vigor and courage of expression that never degenerates into an attack upon the opinions of others, and never forgets the dignity due to the maintenance of his own. The literary beauty of this address is no less worthy of admiration than its moral elevation, and it is no exaggeration to call it a masterpiece. The Duc de Broglie's reply was an eloquent protest against the opinions of the day on matters of education under the control of the state—too eloquent, indeed, for the simplicity of conviction—and seemed to call for the applause which is said to have followed his oratorical climaxes, not so much because his hearers appreciated the force of his arguments as because they already shared his opinions. He is a writer of much ability, and circumstances gave to this portion of his oration a certain present interest which gave occasion for many brilliant passages; but, following M. Gréard's address, his reply seems incomplete and fragmentary, as though he had been disconcerted by an opponent who never laid himself open to attack, and never placed

himself in a position of defence. The honors of the occasion remain with the new member, who seems rather to confer new lustre upon the Academy by his entrance than to receive it.

—At the session of the French Academy of January 26 three elections took place, viz., that of the Comte Othenin d'Haussonville to succeed Caro ; of the Admiral Jurien de la Gravière to succeed Viel-Castel, of M. Jules Claretie to succeed Cuvillier-Fleury. It was only over the second of these seats that any prolonged contest was made, three ballots being necessary before the successful candidate obtained the required majority of seventeen votes. Thirty-two members were present, four being absent and four seats being vacant, including that of M. Eugène Labiche, who died three days before. M. d'Haussonville's election was foreseen, though the greatly superior merits of M. Janet, his principal competitor, were obvious. Since the death of Chantelauze early in the month removed the most deserving among his possible competitors, M. Claretie's election was also to have been expected, although he was probably, in everything but votes, the weakest of any of the candidates.

AN ENGLISH HISTORY OF THE UNITED STATES.

History of the United States: From the Foundation of Virginia to the Reconstruction of the Union. By Percy Greg, author of 'Across the Zodiac,' etc. 2 vols. London: W. H. Allen & Co. 1887.

In an evil hour the *Saturday Review* said that Mr. Greg ought to write a history of the American civil war "in space sufficient to do it justice"; and the *Spectator* added: "Then we shall be able to judge between him and the historians whom he really but informally contradicts." Mr. Greg not only took the *Saturday Review* at its word, by proceeding to write a history of the civil war "in space sufficient to do it justice," but he enlarged his borders so as to embrace the entire history of the American people, and to "contradict the historians" in the past as well as in the present.

If he had confined his ambitious undertaking to the field suggested by the *Saturday Review*, he would have found readers and admirers and, possibly, believers; for the civil war, while its participants live, must be partisan rather than historic, and the more foolish and unfair a partisan book is, the more certain it is to secure a partisan patronage. But there is a common ground upon which all Americans stand, and the Southerner of to-day, with his misfortunes and sorrows still upon him, will not purchase the glorification of Lee by derision of Washington; and the Englishman of to-day, while he may or may not agree with the estimate which the elder Pitt put upon the Americans of 1775, unconsciously reëchoes the little-known speech which George III. made, greatly to his credit, when John Adams presented his credentials as American Minister at the Court of St. James's. Moreover, Southerners have risen above partisanship in many notable instances. Their "war articles" in the *Century*, as the product of the defeated actors in a prolonged and decisive civil war, we deem to be the fairest and most truthful military annals that the historic world contains.

The basis upon which this great work rests is thus stated by the author in his preface:

"I am fully aware that both the general views and many of the particular statements of this work will excite surprise, so vague and incorrect is the current notion, or what I might call the received tradition, of American history. But the most startling of these statements [that is, the "particular statements"] will be found fully avouched by the most partial American authorities. Throughout the First and Second Books I desire it to be understood that my version of facts agrees with Bancroft's and Palfrey's. Where it does not, I have invariably given my authority. In relating facts discreditable to Revolutionary statesmen, generals, and soldiers I have intentionally and even closely followed American writers." "I have given in general, not the authorities on which I have most relied, but those most accessible, and above all those which, as the reluctant admissions of hostile witnesses, are finally conclusive."

These didactic sentences have a certain coherence of sound, and seem, indeed, to have been cast in an historic mould. In reality, they present an extraordinary jumble of ideas, and demonstrate in the fewest possible words the utter unfitness of the author for his task. When Mr. Greg wrote, "The admissions of hostile witnesses are finally conclusive," he probably had in his mind a misty recollection of some rules of the common law which hold certain matters to be final and conclusive as against certain parties; but if he had known anything whatever of the law of evidence, he would have known that, even in the law, the admissions of *witnesses* bind nobody and are never conclusive; and that every writer who ever wrote on the law of evidence classes the admissions of *parties* as the most suspicious and unsatisfactory kind of evidence. For reasons of public policy there are matters and things in the law, termed estoppels, which are deemed final and conclusive; but, as Lord Coke said, about three hundred years ago, "estoppels are odious and not to be favored in law," and he added: "An estoppel closeth a man's mouth to *alleage the truth.*" What shall be said of a man who, in this age of the world, sets out to write a history upon a supposed legal principle which, if applicable, would shut out the truth?

It will also be observed that Mr. Greg promises his readers "statements" some of which will be "particular" and some "startling," and that he immediately adds, "*my version of facts* agrees with Bancroft's and Palfrey's." It is true that he qualifies this by saying that, where his does not agree with theirs, he has "invariably" given his authority. But all of the authorities which he cites in reference to the Revolutionary period are not a dozen in number, and can probably be found in a hundred private libraries in New York alone. We will now illustrate whence these "startling" historic "statements" come.

Three of the Revolutionary statesmen and generals concerning whom Mr. Greg produces "the most startling" of his statements are John Adams, Franklin, and Washington. In 1770 Col. Preston was tried for murder in having unjustifiably ordered his troops to fire upon the people in Boston. He did what any sensible man would have done in like circumstances—he retained the most powerful and influential advocate that he could procure; and that advocate was John Adams, who defended Col. Preston with characteristic intrepidity, strength, and skill, obtaining his acquittal. So much the world knew; but it is now informed that there was such "*organized terrorism* maintained by the malcontents of whom John Adams was a principal leader" that "no colonial barrister *dared* [*sic*] defend the accused unless Adams would set the example"; "that not one or two timid gentlemen, not even a mere majority, but the whole bar of a province like Massachusetts" were compelled to "flinch from their first duty as advocates and citizens," "and abandon the defence of men arraigned on a capital charge; above all when the life and honor of a loyal gentleman and soldier were in question." "Adams saw and snatched his opportunity—if *he had not planned and prepared it.*" "By releasing innocent necks from the halter, he might unravel that which might one day be twisted for his own," etc. No authority is cited for these "particular statements," but they are proved in this way: Col. Preston was "a loyal gentleman and soldier"; "it has never been the practice of loyal men, least of all of British officers, to invoke the aid of seditious lawyers." Therefore, Col. Preston retained Mr. Adams to defend him because nobody else would. A "large minority at least of the profession sympathized with Preston," and "professional honor required every barrister not engaged for the prosecution to accept a brief for the defence." "Nothing but intense and well-founded fear" could have induced them not to discharge their professional duty. Therefore there must have been such "organized terrorism" that "no loyal advocate could have appeared for the accused without palpable and fearful peril."

Mr. Greg proves with equal success in one brief chapter that Franklin was a "rebel," a "sinecurist," a "Puritan," a "plebeian," a "receiver," a "fur," a "vir trium literarum," a "thief," an "offender," an "accomplice," a person of "exceptional views of truth, honor, and honesty," a "culprit," a hypocrite who professed a "passionate shrinking" from rebellion, yet was among "the bitterest, most determined, and least scrupulous of the secret promoters of separation and civil war." He is also shown to have been a person of very moderate ability. "His ethical platitudes may compare favorably with those of Martin F. Tupper ; his elementary experiments in physics hardly place him on the level of Rumford." But there is another "level" which he attains in the same paragraph: "Franklin stands on the level of many other sinecurists," and that seems to be as high (to Mr. Greg's perceptive faculties) as he ever got.

The ability, character, and patriotism of Washington fare very badly in Mr. Greg's hands. We take a single instance of the way he writes "history" concerning him. Major André, according to Mr. Greg's "version of facts," was to meet Arnold on board the *Vulture*. But Arnold sent for him to come ashore, and he came under cover of darkness. The conference lasted till daylight, and then Arnold prevailed on him to remain on shore until the following night. At 10 A. M. the plans of West Point were concealed in his boots "at Arnold's request," and a pass was given him in the name of John Anderson "for Arnold's security," and Smith, who had brought him from the *Vulture*, was desired to put him on board after dark. But when evening arrived, Smith refused to do this. Here was a fine opportunity for Mr. Greg to make a point against the whole American people, and, like John Adams, he "snatched his opportunity." "André was thus," says he, "compelled by *Americans* [Arnold and Smith] to repass the American lines and return to New York by land." Mr. Greg then descends to a foot-note on the character of Smith, and, by his own peculiar historical process, establishes a number of things: That Smith "was acting as a spy in Washington's service"; that "it was by an *American officer* [Arnold] that André was brought, against his will and in defiance of his stipulations, within the American lines"; that "it was by an *agent of Washington* [Smith] that he was twice detained within the lines," "and induced to adopt a disguise"; that "Smith was responsible for the disguise, for its necessity, for every incident of the case except the original treachery which brought André within the lines"; that "in the

one critical fact of disguise" André "was *the dupe of Washington's own agent*"; and, finally, Mr. Greg, by another application of one of his legal ignorances, reaches the astounding folly of saying that André "*was the dupe of Washington himself*"!

Having thus established the historic facts, Mr. Greg indulges in some very fine legal reasoning. For instance, he says of André, who skulked into the American lines after dark for the corrupt purpose of bribing the officer in command: "Technically, André was protected by a flag of truce and the passport of the American Major-General in command [Arnold]." "Technically, André was an envoy!" Mr. Greg then makes a number of his "most startling statements." It was Washington's "determination that, guilty or innocent, the prisoner should die." "The nomination of the court-martial" "fixes a clear and paramount responsibility on the Commander-in-Chief"; "its President was his devoted creature [General Nathaniel Greene], a man utterly devoid of education, literary or social, a blacksmith till called by the outbreak of war from the forge to the field; necessarily as ignorant as any British private of the distinctions and even of the principles of military law." Washington knew that he himself would be regarded, "and justly," "as judge and executioner." His offer to spare André if Arnold was given up was an "infamous proposal," which only served to refute "'the tyrant's plea of necessity.'" "His vengeance still insatiate," he "descended to a stratagem *worthy of his intended victim*," Arnold. "He hired a gang of scoundrels under the command of one Champe" to enlist in Arnold's command. (See, in this connection, Colonel Lee's most interesting account of the heroic Sergeant, Champe's, escape, Chap. xxx., Lee's Memoirs.) "They were formally enjoined to bring him alive and unhurt within the American lines"; but Washington was "far too experienced a soldier" to believe that they would, and attempts of this kind have always been regarded as "*thinly veiled schemes of assassination.*" But "the plot failed, and Washington's hired kidnappers escaped the gallows by a hasty flight." It will, nevertheless, grieve every lover of true and impartial history to hear that an historian whose business it is to correct American "traditions" is himself guilty of two "versions of facts" which cannot possibly be reconciled. At page 307 he says of Washington, that "no officer" who served upon the court-martial could "have acquitted André" "without placing himself in direct and flagrant antagonism to that *cold*, unforgiving, implacable spirit." At page 374 he returns to "André's murder," and speaks of Washington's well-known "*outburst of rage*" on hearing of the massacre of St. Clair's troops as "recalling that which sealed the fate of André."

There is another branch of historic evidence in Mr. Greg's work which should not pass unnoticed. Our readers will remember in the quotations the repetition of the word "gentleman." That snobbishness runs through the book, and the uses to which it is put become as amusing as a vulgar absurdity can be. Thus, of Arnold:

> "A chivalrous gentleman and soldier might have found reason to resign his commission in the American service, but while he retained it would have felt that nothing could release the obligations it entailed. Unhappily, Arnold belonged to that class of New England officers who, as their chief bears incidental but decisive witness, were not gentlemen!"

Of our American historian:

> "Mr. Bancroft ventures without authority to accuse Clinton of the unsoldierly falsehood of multiplying the number of prisoners [taken at Charleston]." "It will be needless in future to quote or refute the allegations or invectives of an experienced diplomatist who never learned that British officers and gentlemen of station and repute like Clinton's do not lie!"

In the first of these instances, Mr. Greg refers to gentlemen in the abstract. In the second, he grows more intense, and comes to the British gentleman. But after quoting Brooks's account of his attack on Mr. Sumner (and nothing else) as authentic history, he enlarges his geographical borders and says loftily: "Brooks was as utterly incapable of falsehood or equivocation as a typical *French* or English gentleman." But Franklin, the Puritan, the plebeian, the "fur," the "vir trium literarum," rouses Mr. Greg almost beyond endurance, so that he well-nigh bursts all geographical restraint as he exclaims: "Franklin was summoned, and, while withholding the name of the thief, avowed himself the receiver, and took upon himself, with an audacity astounding to the boldest of French, *English*, or GERMAN gentlemen, the whole responsibility of the transaction."

History, in this age of the world, holds itself liable to be investigated at any point, and to have its decisions reversed upon any subject. But accepted history can be overthrown only by patient research, newly discovered evidence, overlooked material, or vigorous deductions upon strictly scientific methods. This book is a history without an historian. It does not contain a particle of original research; it does not bring to light a single document, letter, note, or order. At a period when history is struggling towards the region of absolute truth, and is striving to depict historic events in the light in which the actors saw them, such a book is a crime against history. Its animus is mischievous—to arouse ill-feeling between America and England, and awaken resentments between the North and the South. Its purpose is contemptible—to display the childish vanity of a writer ignorant of his subject and utterly untrained for his pretentious task. There are dozens, if not hundreds, of young newspaper attachés in London and New York who, if they had been told by the editor to read up on history and get something from the English point of view for the Sunday edition, would have done the work better and furnished it week by week. Mr. Greg is one of those weak writers who can maintain a vivid style so long as they can fabricate the facts to be described, but who flounder and drag when they are harnessed to real events and characters, just as there are weedy colts which can cut prodigious capers in the pasture, but which go to pieces as soon as they are brought to the test of real work. His petty blunders, inaccuracies, and mistakes we make small note of. He designates the Boston Tea Party, or riot, as "robbery," not from a vicious or libellous motive, not because he thinks the tea was stolen, but because he does not know what the word "robbery" means. The masterly movements of Greene which saved the army and ultimately led to Yorktown, he classifies as "Disasters of Greene." One would suppose that a novelist writing a history would at least make it entertaining; but there is not a picturesque description, a graphic narration, a fine personal characterization in the two volumes. The book could not be more false if it were a fiction; nor more stupid if it were—a history.

MORE NOVELS.

Paul Patoff. By F. Marion Crawford. Boston: Houghton, Mifflin & Co.

Marzio's Crucifix. By F. Marion Crawford. Macmillan & Co.

April Hopes. By W. D. Howells. Harper & Bros.

Captain Macdonald's Daughter. By Archibald Campbell. Harper & Bros.

Frau Wilhelmine. [Conclusion of The Buchholz Family.] By Julius Stinde, translated by Harriet F. Howell. Charles Scribner's Sons.

WHEN *Valentine*, tearing himself away from *Verona* and *Proteus*, declared that home-keeping youths have ever homely wits, he uttered a word of warning to the story-tellers of coming generations. Those of our own time are not slow to heed it, and to Marion Crawford it is a guiding star. Had he chosen a hermitage for a home, and there dwelt apart, there is no knowing what marvels he might have evolved from his inner consciousness, yet the home-keepers cannot regret that he elects to see and to describe the wonders of the world abroad. For the home-keeper, of necessity largely in the majority, is provided with an inner consciousness similar to his neighbor's, and in his heart is an eternal longing for change, an unquenchable devotion to something afar from the scene of his sorrow, or his joy, or his middle state which is the most enduring and unendurable. Since he cannot have change in fact, he wants it in fiction, and deep should be his gratitude to the travelled youth who temporarily fills the void. To this noble end Mr. Crawford labors diligently, and in 'Paul Patoff' covers himself with glory. He makes Constantinople his *pied-à-terre*, running to and fro over the Continent of Europe and the British Isles. He busies himself chiefly in clearing up a case of strange disappearance, and enlists in the investigation a delightfully mixed company of Russians, English, Turks, Ethiopians, and Jews, all leavened by one American on whom devolves the duty of telling the tale. Incidentally these representatives of foreign Powers involve each other in small but trying troubles, to extricate them from which a kiosk on a hill at Therapia is burned, and several very valuable lives are imperilled. The outline of the story, founded on the question how and by whom was Alexander Patoff spirited away from the Mosque Saint Sophia, is thoroughly clear and good. Like the plot of the ideal play, it can be coherently told in five minutes. The evolution moves on steadily through a series of ingenious incidents of which only one or two are hackneyed or capricious. The weak point is Paul Patoff's slowness to suspect and follow up a very obvious mark for suspicion, the veiled lady whom Alexander had affronted in the Valley of Roses.

The people are well conceived for carrying on the plot, and, if some are imperfectly drawn, allowance must be made for their diversity. Paul, who ought to be the solidest figure, is the most shadowy. He suffers from insinuations which come to nothing. He conceals the extremes of Slav nature attributed to him, bearing his trials impassively as a Stoic and with the dogged honesty of an Englishman. His sweetheart, Hermione, is a little wearing. It is always difficult to sympathize with the feminine conscience which manifests itself in a desire for wider experience—that is, for more men—after its owner has accepted the love of her first lover. A love affair between her and Balsamides Bey would have been most interesting. He had a way of overcoming obstacles more terrible than a girl's conscience, which, for ruthless audacity, is incomparable. If Balsamides is not a real Turk, he is an impossibility. He could never have been born of Frank parents and hardly of a Frank's imagi-

nation; therefore he must be regarded as the result of close and intelligent observation. He appears to be as thoroughly a Turk as the inhuman Mme. Patoff seems not to be an Englishwoman, unless she was a crazy Englishwoman—a theory which the reader would comfortably accept were it not for the quasi-scientific arguments against it. These arguments are part of the deadwood which obstruct the flow of the narrative, and may easily be accounted for when we remember that the novel was published first in monthly instalments. Further sops to the demand for copy are discernible in lengthy journalistic descriptions, and, worst of all, in the gratuitous sermons. A man of Mr. Crawford's versatility should deny himself the lazy luxury of expanding indefinitely a few verses of Ecclesiastes. It is true that he guards himself against such criticism by constant reminders that the story is told by no literary fellow, but by a plain, blunt man, for the amusement of a woman. His safeguard effectually betrays him. It is not in the nature of a Griselda to put up with preaching when she is dying to know what became of Alexander Patoff, and whether Hermione married Paul or didn't. The reason for these blemishes is very plain, and, seeing that such digressions are blemishes, it would be wisdom in writers of serials to revise their work before publishing it in a book.

In 'Marzio's Crucifix' there is hardly a superfluous page. It is short, yet not hasty, strong, and well-finished. A superficial impression of the Italian people, gathered from fiction written in English, is that they spend the days in posing for artists and the nights in perpetrating crime, for which pursuit a slouched hat and black cloak are as necessary as is the incisive stiletto. Mr. Crawford breaks away from this picturesque melodrama, and writes about a Roman family of the middle class whose dull round of existence is temporarily disturbed by one of those storms which occasionally convulse the quietest families in Italy and elsewhere. Marzio, the head of the house, is the exciting element; and the greatest strength of the story is in his portrait. He was a troublesome person to get along with, and is still more troublesome to describe without prejudice. Mr. Crawford sets forth impartially the best and the worst in him, and makes a wildly contradictory nature thoroughly comprehensible. Marzio really was the victim of excessive imagination and very bad temper. When busy designing or executing a chalice or a crucifix, his imagination had legitimate employment, and he was harmless. Once permitted to stray from his work, it became unmanageable and wrought the man into a species of frenzy against the King and the Church, against all existing conditions; an abstract, impotent rage which hardened into hatred of his brother Paolo, the priest, and angry suspicion of his own wife and daughter. He is too weak to initiate the social revolution of which he dreams, and, though he believes himself a born leader, is nothing but a vain babbler in wine-shops and a terror to his household. But, as Marzio is almost wrecked by his imagination, so, in a moment of temptation to kill his brother, he is saved by it, and one hopes that his passionate gratitude for his escape may lead to permanent reformation.

The social questions involved in the analysis of Marzio's character are cleverly discussed, showing that in the author's mind there exists no confusion of the terms liberty and license, freedom and anarchy. The love-affair of Lucia and Gianbattista, which Marzio's imagination and bad temper together failed to interrupt, is very pleasant and healthy; its tenderness being rather heightened than diminished by the practical texture of all their visions of happiness.

Love's young dream is the theme of Mr. Howells's 'April Hopes,' and he cannot be said to lend enchantment to the old story. Still, since to lend enchantment to anything in heaven above or on earth beneath is no part either of his theory or practice, he should not be blamed for neglecting to do not only what he scorns to attempt, but would resent being accused of. The spirit of truth is an admirable spirit to animate a novelist, yet, if zealous cultivation of it implies the annihilation of all other spirits, including the spirit of charity, the erring novel-reader will grow restive, and end by longing for nothing so much as for a few pleasant lies. If any one word can characterize Mr. Howells's attitude towards Dan Mavering and his sweetheart, and all the Boston people interested in their uncertain loves, it is uncharitableness. It is not only that he never permits himself to be "to their virtues very kind," but he is never "to their faults a little blind." Far from it, he digs fathoms deep for them, he tosses them to and fro in broad daylight, he gives to the molehill of frailty the prominence of a mountain of depravity. The section of Boston society thus, as it were, excavated need not tremble at the exposure. Not an evil passion is disclosed, much less a deadly sin. It is fairly sound, root and branch, though not exactly swelling with sap. The worst revelation is that of a tendency to dry rot, and of an alarming parasitical growth of censoriousness, spite, double-dealing, hypocrisy, and affectation round the trunk of Puritan righteousness. Besides, it is cleanly shorn of pretensions to that intellectual supremacy in which the world rightfully or wrongfully has long cherished a belief. The attacks of Mr. Howells's truth-telling demon on this belief have been insidious and persistent, and now we know that we long worshipped false gods. That is to say, we know it while under the influence of Mr. Howells, just as we know, while mentally in his company, that it is wrong and foolish to erect a standard of ideal perfection, to aspire to it, to struggle towards it, and gloomily suspect that such a proceeding is not compatible with common sense or ordinary intelligence.

'April Hopes,' like all the author's works, is, in a conventionally moral sense, above reproach; but its tendency to blight germs of spirituality is hardly less harmful to character than is the corrupting influence of novels which describe the base or vicious sides of life. No one is the better of its trivial worldly wisdom, while the young and impressionable are apt to be the worse. The pleasure it gives is almost entirely dependent on the possession by the reader of what may be called the literary sense. That sense is deeply gratified by the irony so delicate that its frequent ill-nature is condoned by the accurate expression of habits of manner and speech, of secret thought, and even of the haziest intellectual perception. The gain to fiction from the author's allegiance to that division of literature is not so great as the loss to metaphysics. All his exceptional qualities, not excluding his wit, would shine more brilliantly in abstract exposition. Not one demands fiction for its exhibition except that which makes his dialogue a marvel of vivacity and cold blood. If human beings were nothing but machines for ever rattling off superficially cynical frivolities, Mr. Howells could draw them with absolute perfection.

The author of 'Captain Macdonald's Daughter' seems to share Mr. Howells's conviction that the moral health of the world would suffer from a slight suppression or merciful veneering of the congenital imperfections of those unhappy ones whom they pounce on for dissection. Nan Macdonald is original sin incarnate. Her father was the devil in the alluring disguise of an officer in her Majesty's service. He, after a short but uniformly iniquitous career, departed this life, leaving his daughter for inheritance a bundle of I. O. U.'s and all the objectionable impulses and dishonest propensities conceivable. The forlorn little wretch, romantic, silly, and an incorrigible liar, is placed in circumstances finely adapted to perfect her natural traits. Whenever she slips, and she is always slipping, her dread of the scorn of her Scotch relatives plunges her deeper in the mire. When she tries to rise, the hereditary shackles tighten, and down she goes into hopeless depths of shame. If we grant predestination, inexorable fate (and to grant these is what rigid adherence to the doctrine of heredity comes to), then Nan Macdonald could be only that which she is represented—her father's daughter. But, in fairness to her, more stress should be laid on what she tried to be than on what she couldn't help being. Such a view of the requirements of justice would, however, probably appear to the author a weak concession to sentiment, a pandering to falsehood. She guarantees the presence of some sort of palliative virtue by telling us that many people liked Nan, and that one man loved her. The lover is faint-hearted and singularly tactless even for a man. When Nan seems to give him up to another woman, at a sacrifice of her own affection, it is much more consistent to assume that her wicked heart had really devised an effective way of getting rid of him.

Nan's history is a very depressing one, and that implies that it is neither weak nor trivial. It is indeed told with strength and assurance, and one regrets that the author so resolutely ignores those aspects of truth which may be dilated on without driving humanity to despair of itself. The construction is faulty; the interest being broken by the transition from Scotland to Virginia. One never gets a comprehensive view of scene and people, but must be content with fragmentary glimpses. Several of the Virginia episodes are useless and irrelevant, and the scenes in the Scotch manse are more a collection of anecdotes fathered on one family, than a harmonious picture of domestic life.

Any shreds of respect for the race remaining after reading 'April Hopes' and 'Captain Macdonald's Daughter' disappear as we follow the conduct and gossip of 'Frau Wilhelmine' in the concluding portion of 'The Buchholz Family.' The comfort here is, that all these dull, sordid, contracted creatures are of one nationality. Since the Germans have taken Stinde to their bosoms and proclaimed him the prophet of their middle class, far be it from a foreigner to protest that they are in any respect more attractive than he has painted them. Any one in doubt about the meaning of the word vulgar is commended to 'The Buchholz Family,' where it is amply and exactly defined. The vulgarity is not only in their customs, which are disgusting, but in their thoughts and feelings. Their standards are low, their judgments narrow, their motives mean. They have no manners, and they, the women especially, talk to each other with brutal coarseness. The civilities of life are unknown to them, the proprieties ignored, and the decencies outraged. They are envious, spiteful, meddlesome, and mercenary, and they thank heaven that they belong to the cultivated classes! If the Buchholz family appeared to the Germans what they really are, it is natural to suppose that the family would not have been received with

such favor. If Stinde thought they were at all offensive, he could not have so thoroughly identified himself with their vulgarity. Therefore an outsider must accept his work for what it seems to be, a close transcript of an actual phase of life of which he is a part. If the author can remotely conceive of the impression on the foreign mind made by Frau Wilhelmine and her tribe, he must write for the purpose of exciting inveterate repugnance for the whole German nation. The book is most admirably translated, so that no injustice is done to the charms of the original.

The Elements of Political Economy. With Some Applications to the Questions of the Day. By J. Laurence Laughlin, Assistant Professor of Political Economy in Harvard University. D. Appleton & Co.

Professor Laughlin has estimated with admirable judgment the relative importance of the main principles of political economy, and has presented these principles in a clear and compact form. This done, the economic questions now before the public—socialism, taxation, the national debt, free trade and protection, bimetallism, the banking system, the labor problem, and coöperation—are discussed ably and authoritatively, the author rarely losing that judicial tone which should characterize a science text-book. There are, of course, individual topics respecting which each reviewer will disagree with Professor Laughlin; yet in almost every instance his position is that which the consensus of living political economists may be said to uphold.

Nevertheless, in spite of these merits, the book will hardly fill the niche for which it was intended. As stated in his preface, Professor Laughlin's aim has been so to present the economic principles which underlie our public questions that they may be understood "by the average American youth, whose education is restricted to the high school or the academy." To this end each chapter is accompanied by a list of questions intended to stimulate the thought of such pupils, and many subjects are presented graphically by means of diagrams and charts. Yet these expedients, however well considered, do not succeed in making the book popular. The writer is by nature an abstract thinker, and though his arguments do not lack for facts, and telling facts, these are drawn from the reading of history and not from talking with ordinary men about ordinary affairs. Even in a less degree are they facts which go home to the ordinary boy. There are, if one stops to think of them, a vast number of things which come within the range of a boy's experience which have economic significance, and which can be made the basis of a popular study of the elements of political economy.

Turning now for a moment to the doctrines of Professor Laughlin's 'Political Economy,' one finds most to criticise where he would expect to find least. If there is any question upon which the author is regarded as an authority, it is that of bimetallism. Yet in his chapter upon it, in accounting for the recent fall in the value of silver, after mentioning the common theory that it was due to the action of Germany and the Latin Union, he continues as follows:

"The real cause, in my opinion, however, was the *great abundance of gold.* Since 1850 one and one-third times as much gold has been produced as in the three hundred and fifty-seven years from the discovery of America down to 1850. . . . Countries whose transactions were large and increasing wanted, naturally, the money which was least bulky and most valuable. These people have always had a preference for gold over silver. At any rate, the abundance of gold allowed France and Germany to discard silver, and gold took its place. It is like the case of a people living on a cheap diet, such as potatoes, who, when they find that wheat becomes cheaper and more abundant, take the wheat and give up the potatoes. Then the potatoes, no longer being in so great a demand, fall in value. So it is with silver. Gold took its place as money, and silver was discarded."

This argument surely is not very convincing, even to a monometallist. The phenomenal increase of the world's gold supply is not the fact of the last decade, but of the two decades following the gold discoveries in Australia and California. During these the abundance of gold caused the disuse of silver—not, however, by making it depreciate, because in fact it appreciated. The wheat-and-potato-illustration is even worse. When wheat becomes more abundant, the decreased use of the potato is due to the fact that it has become relatively dearer. As between silver and gold, silver has become, not relatively dearer, but relatively cheaper. Nothing in political economy could be plainer than that the decline in the value of silver during the great silver-mining era since 1872 has been due to the abundance of silver, and nothing else. The value of silver, like the value of other products of labor, depends upon the probable cost of reproduction. The diminished cost of producing silver fully accounts for its fall in price. This diminished cost of production is due, as Mr. Geo. F. Becker, United States Geologist, points out in a recent pamphlet, "in part to new discoveries, but much more to the increased facilities for transportation and the consequent cheapening of supplies in the mining districts."

But this faulty argument stands alone in the volume. Professor Laughlin's views are conservative, and his reasons for them are generally of recognized strength. The most interesting of his financial views is his apparent belief in a multiple standard for long contracts. The argument in favor of it is of course obvious. Our unit of value would represent not a certain quantity of gold, but a certain quantity of each of the staples of commerce—corn-meal, flour, brick, lumber, beef, pork, potatoes, wheat, etc. In this way, a dollar would always represent the same purchasing power. The practical difficulties in the way of adopting such a standard are, of course, equally obvious. Professor Laughlin recognizes these; but, in discussing the plans of the International Bimetallic League, he makes the pertinent suggestion that "as the object of the League is to furnish a steadier standard for deferred payments, a much easier way to effect this, and one which any single nation can follow by itself, is to establish a multiple standard."

Christendom, Ecclesiastical and Political; from Constantine to the Reformation. The Bishop Paddock Lectures for 1887. By John Hodson Egar, S.T.D. James Pott & Co.

The six lectures contained in this volume are of interest in several ways. They are the first fruits of an endowment made in the year 1880 by Mr. George A. Jarvis of Brooklyn, N. Y., to found and maintain a lectureship in the General Theological Seminary of the Protestant Episcopal Church. This foundation is to be known as the "Bishop Paddock Lectureship," and is to be welcomed as promising, under wise administration, the same sort of usefulness which has been reached in England by the Hibbert and Bampton trusts. The subjects of these lectures are to be "such as pertain to the defence of the religion of Jesus Christ as revealed in the Holy Bible and illustrated in the Book of Common Prayer against the varying errors of the day." Among the various special topics whose defence may be undertaken by the lecturers is the historical reformation of the Church and her rights and powers as a pure and National Church. It is under this provision that Dr. Egar selected his topic.

The book is interesting further as showing what may be accomplished by a bright man with insufficient tools and materials. There is no evidence that Dr. Egar is acquainted with the German language; his works of reference have been few in number and general in character; as a contribution to modern critical scholarship his work cannot command serious attention. Its very considerable value lies in the clearness of its aim, the general accuracy of its conclusions, and its power of seeing the real point at issue in the midst of conflicting and often irreconcilable opinions. Although he is the avowed exponent of a church calling itself "Catholic," Dr. Egar is willing to give all due credit to movements within the church universal, which the members of his particular sect are not usually too ready to approve.

His fundamental proposition is that the history of the Church cannot be understood without constant reference to the conditions of public life around it. This may seem a truism to any trained scholar, but our author has done well to call attention to the points at which the usual text-books of Church History fail in this respect. He brings us back to a reflection which we are always in danger of forgetting, that the Church is made up of human beings, and that the highest demand we can make upon the Church of any day is that it shall take a stand upon moral and religious things a little higher than that of the community in which it stands and of which it is a part. The senseless abuse of the Church in any age for being what the standards of that age make it, is the object of his repeated attack. Especially valuable is the defence of the mediæval clergy against the attacks of their enemies, both contemporary and modern, who have judged them by wrong standards. The contemporaries were wrong, because they had a standard which would have required priests to become angels, and the moderns have been wrong, because they have accepted contemporary criticisms as if the sins imputed to the clergy had been sins in the modern sense. The author might have strengthened his reference to Peter Damianus by quoting that reformer's own confession that the Milanese clergy were in all respects models of virtue—if only they had been free of the abominable sin of Nicolaitism, a sin which, in Dr. Egar's view, meant nothing more than that they were honestly married to respectable wives.

In minor matters we might find many things to criticise. For instance, it is very doubtful whether Charlemagne was ever, even in sport, a scholar of the *schola palatina.* It would probably be a little difficult to show that the *missi dominici* were in any sense "the originals of our Circuit Courts and Circuit Judges." The explanation here given of the vexed question, why Charlemagne allowed himself to be crowned Emperor at the time and place at which the coronation actually happened, if, as Einhard tells us, he did not wish to be crowned, is as unfortunate as most other explanations which have been attempted. Dr. Egar thinks that Charlemagne's objection was to the coronation *by the Pope;* but why in the world a man of Charlemagne's immense resources of mind and materials should have put up with a ceremony of which he did not approve, and which he might have repudiated with the

greatest ease, is very hard to see. In our opinion the case is only one of the endless number in which persons, especially in the Middle Ages, when raised to positions of great importance, found it decorous or profitable to protest that they never desired such elevation, and only consented to it because of a profound sense of duty. Such protestation might be regarded as almost a formula at every mediæval promotion. So with regard to the "vacancy" of the Eastern throne, because to the Frankish mind a woman could not hold the empire. We see no real evidence that Charlemagne would not have assumed the title when he got ready for it if the doughtiest Roman that ever lived had sat upon the throne of Constantinople.

The whole account of the process by which the Bishopric of Rome became the Papacy of the West is given with a great deal of discrimination. Perhaps a little too much weight is laid on the assumption of power by the Papacy, without quite enough emphasis on the corresponding acceptance of this assumption by the churches of the West. There are of course notable cases of protest, but on the whole the churches of the West were in no condition to offer the kind of resistance to the papal aggressions which these encountered in the East. The real reason for this lies, it seems to us, in the absence of great cultivated communities in the West such as were found in every eastern country. The Papacy grew because it was needed, and when it was no longer needed it was thrown away.

Nothing could be better than Dr. Egar's account of the relation of Leo I. to the Council of Chalcedon. Doubtless the opinion of the Pope prevailed there, but the Romanist is not content with that statement; he insists that it prevailed because of the regard for the Roman Bishop as such. We are here given the truer view that it prevailed because it happened to be that of the dominant party at the moment. The action of the Council in elevating the Bishopric of Constantinople to an equality with Rome, shows conclusively that it was in no danger of following the lead of the West in servility to Rome.

We are grateful to Dr. Egar for having put so clearly and concisely the essential points in the great question of the relation of Church and State in the Middle Ages.

Register of the University of Oxford. Vol. 2 (1571–1622). Part I. Introductions. Edited by Andrew Clark, M.A., Fellow of Lincoln College and Vicar of St. Michael's, Oxford. Part II. Matriculations and Subscriptions. 8vo, pp. 423. Printed for the Oxford Historical Society, at the Clarendon Press, 1887. 8vo, pp. 467. New York: Macmillan.

Alumni Oxoniensis: the Members of the University of Oxford, 1715–1886, their parentage, birthplace, and year of birth, with a record of their degrees. Being the Matriculation Register of the University alphabetically arranged, revised, and annotated. By Joseph Foster. London: Joseph Foster, 21 Boundary Road. Vol. 1, pp. 401. Abbay–Dyson. 1887. Vol. 2, pp. 406. Eade–Kyte. 1888.

THESE two works supplement each other, and, when completed, will be of the greatest value not only to genealogists, but to all others who wish to trace the lives of the graduates from the great English University. The 'Register,' of which the first volume was noticed by us at its appearance, is the official reproduction of the manuscript records, a necessary undertaking to prevent the loss of these indispensable authorities. Part i of this volume gives the official life of the University during the period named, the requirements for the degrees, the ceremonies in taking them, the methods by which they were obtained, all of which were carried on with formalities and to an extent of which our modern graduates can have but a slight conception. In Part ii the list of matriculations is continued in chronological form, with the county in which the student was born, his age, and the quality or social standing of his father. The sons of the nobility are easily distinguished; the son of a knight (*eques* or *miles* or *eques auratus*) is distinct from that of an esquire, *armigeri filius*, or of a gentleman, *generosi filius*. Lastly, the son of a commoner is *plebeus* or *plebei filius;* but, as the editor points out in the preface to Part ii, page 25, there is reason to think that the paternal status was often understated in the matriculations. There was a scale of fees, proportioned to the father's quality, the highest in rank very properly paying the most. Hence economy would suggest a prudent modesty on the part of the applicant, who afterwards, in asking for his degree, could suddenly remember that his family was more distinguished socially. The editor states that he has noticed on the records numerous instances of this transformation, and of course there must have been many more cases where this enforced humility was maintained throughout.

No index is given to Part ii and no notes upon the persons named. It is to be the official register, invaluable as far as it goes, but not a biographical dictionary. Undoubtedly the enterprise so well begun will be speedily brought to a prosperous conclusion.

The 'Alumni Oxoniensis' of Mr. Foster is the counterpart of the foregoing work, as it is an alphabetical register of the graduates for a certain period, and condenses under each man's name the entries personal to him, matriculation and degrees, and in most cases undertakes also to give his preferments, clerical or other. It will be noticed that Mr. Foster's period, 1715-1886, is one calculated to be of great service to the modern Englishman, but it entirely omits that earlier time in which Americans have a joint interest with their cousins. This work is avowedly based upon the transcript of the Oxford matriculations made by the late Col. Joseph Lemuel Chester, and we may well be proud that an American was the means of stimulating Englishmen to make available these records. Mr. Foster has, of course, had the vast additional labor of collating the different entries, and of adding to them the items relating to the post-collegiate life of the graduates. In such matters he stands without a rival, and this enterprise will further extend his fame and renew the obligations under which he has placed the literary community. He intends to complete this register in four volumes at a guinea each, and it is to be hoped and expected that many libraries in America will be enrolled among his subscribers.

Face to Face with the Mexicans. By Fanny Chambers Gooch. With 200 illustrations. Fords, Howard & Hulbert. Pp. 584.

MRS. GOOCH might easily have won for her book a distinct place in the list of modern works on Mexico. She has a considerable body of material that is really fresh and not badly handled. It is a pity that she chose to hide this away in the great mass of second-hand or worn-out wrappage to be found in her bulky volume. If she had left out entirely her chapters on the legendary history of Mexico, on the general history of the Mexicans, on their Government and their statesmen — writing for which she is inadequately equipped—and had printed only her descriptions of domestic life and social customs, her account of the modern literary movement, and her very welcome collection of the more popular songs of Mexico, we should have had little but praise for her work. Even then, however, it would have been necessary to put the reader on his guard against the extravagant laudation of the leading writers of Mexico. Their literature is not exactly on a par with that of the Elizabethan age. Poetry composed "on the spot, without a moment's preparation," though it commanded Mrs. Gooch's admiration, is probably not of the highest order. Then, too, we get a disagreeable impression of servility, on the part of the author, in her contact with the exclusive society of the capital. She often appears too much in the guise of a reporter admitted on sufferance within the charmed circle, and bound to praise everything to the top notch. In this respect, her book is in strong contrast to that of Mme. Calderon de la Barca, of which, in some ways, it pleasantly reminds us. The wife of the Spanish Minister could meet the finest people of the land as an equal, and was in no danger of being patronized or becoming subservient. This danger Mrs. Gooch has not wholly escaped. She makes a characteristic mistake in supposing that Bernal Diaz's history has never been translated into English (p. 376). It is very amusing to find that she has also been made a victim of that adroit prelate, Bishop Riley. To appeal for contributions to aid him in "his great work," and to print a commendatory letter from his pen, is to betray great ignorance of his actual situation and prospects. The majority of the illustrations are good. Many of them, however, are spoiled in the printing, and some of the old plates which the publishers have picked up are so antiquated that they picture things no longer in existence.

BOOKS OF THE WEEK.

A Baton for a Heart. Chicago: Rand, McNally & Co. 50 cents.
Academy. Vol. II. Syracuse: George A. Bacon.
Bankers' Almanac and Register, for 1888. Homans Pub. Co.
Benjamin, J. P. Treatise on the Law of the Sale of Personal Property. Houghton, Mifflin & Co. $1.50.
Bercy, P. La Langage Française. Part 2. W. R. Jenkins. $1.25.
Cooke, Carrie A. The Art of Living. From the Writings of Samuel Smiles. Boston: D. Lothrop Co.
Cutter, W. P. and Julia P. Life, Journals, and Correspondence of Rev. Manasseh Cutter, LL.D. By his Grandchildren. 2 vols. Cincinnati: Robert Clarke & Co.
Foster, J. Alumni Oxoniensis: The Members of the University of Oxford, 1715–1886. Vol. II. London: Joseph Foster.
Gooch, Fanny Chambers. Face to Face with the Mexicans: The Domestic Life, Educational, Social, and Business Ways, Statesmanship, and Literature, Legendary and General History of the Mexican People. Fords, Howard and Hulbert. $4.25.
Harmonia: A Chronicle. Macmillan & Co. $1.50.
Heilprin, Prof. A. The Geological Evidences of Evolution. Philadelphia: A. Heilprin.
Hill, G. B. Wit and Wisdom of Samuel Johnson. Macmillan & Co. $2.
Howells, W. D. Their Wedding Journey. With an Additional Chapter on Niagara Revisited. Illustrated. Boston: Houghton, Mifflin & Co. $1.50.
Ingleby, C. M. Essays. Edited by his Son. Trübner & Co.
Jones, L. A. An Index to Legal Periodical Literature. Boston: Charles C. Soule.
Kinney, C. Lyrics of the Ideal and the Real. Cincinnati: Robert Clarke & Co.
La Neuvaine de Colette. W. R. Jenkins. 50 cents.
MacAlister, J. Catalogue of the Pedagogical Library and the Books of Reference in the Office of the Superintendent of Public Schools, Philadelphia.
Maclaren, Dr. A. The Epistles of St. Paul to the Colossians and Philemon. A. C. Armstrong & Son. $1.50.
Martineau, J. A Study of Religion: Its Sources and Contents. 2 vols. Macmillan & Co. $6.
Morley, J. Aphorisms: An Address Delivered before the Edinburgh Philosophical Institution. Macmillan & Co. 50 cents.
Newman, W. L. The Politics of Aristotle. 2 vols. Macmillan & Co. $7.
Owen, Catherine. Gentle Breadwinners: The Story of One of Them. Boston: Houghton, Mifflin & Co. $1.
Palmer, Lady Sophia. Mrs. Penicott's Lodger, and Other Stories. Macmillan & Co. $1.
Perowne, J. J. S. The Doctrine of the Lord's Supper. A. D. F. Randolph & Co. 60 cents.
Raffensperger, Mrs. A. F. Patience Preston, M.D. Boston: D. Lothrop Co.
Schaff, Dr. P. Church and State in the United States. [Papers of the American Historical Association. Vol. II. No. 4.] G. P. Putnam's Sons. $1.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 23, 1888.

The Week.

THE Republican press is left in a bad box by the attitude of the Republican Senators towards the Blair bill. The more stupid party organs had been abusing the Southern Democratic Senators who opposed the measure on constitutional grounds as "the States'-rights, fire-eating leaders of the South," when that gun was effectually spiked by the States'-rights speech of that Union soldier, Northern Republican Senator, and possible Republican candidate for the Presidency, Gen. Hawley. The more sensible papers had been calling Mr. Blair an ass and his bill "absurd," "demoralizing," and "preposterous," and yet, when the roll was called, two-thirds of the Republican Senators followed the New Hampshire leader in voting for it. An occasional Republican paper, like the Lewiston *Journal*, still tries to defend the bill as one which ought to become a law, but it finds itself met by the negative votes of both the Republican Senators from Maine and the unanswerable speech against the measure by Senator Hale. In short, if a Republican paper attempts to argue that the bill ought to pass, it has to encounter the demonstrations by Republican Senators like Hawley, Plumb, and Hale, that it ought not to pass; while if it argues that these speeches show that the bill ought not to become a law, it has to try and explain the inexplicable fact that two-thirds of the Republican Senators voted to make it a law. From either point of view, the task of deducing from the incident the lesson that the Republican party is the only one fit to grapple with important public questions, appears equally difficult.

The accounts of the Canadian Fisheries Treaty with Great Britain, which has been signed, are too meagre as yet for any extended comment. It seems at this writing as if nearly everything which Americans have asked for had been conceded, and especially the mode of measuring the extent of territorial sovereignty along the shore, which is now to follow the line of the land, at headlands as well as elsewhere; and, we presume in deference to the greater carrying powers of modern guns, the limit is to be four miles seaward instead of three. The treaty will doubtless be well received in England, where people care nothing about the dispute, but do not want to quarrel with the United States. In Canada, if we may judge from the attitude of the press, the Ministerialists will accept the arrangement, and the Opposition denounce it, but the former will probably carry the day. That it will, however, if it be what it is reported to be, strengthen the annexationists, we think there is little doubt.

It is, of course, dangerous to predict what the Republicans in the Senate will do with the Treaty; but if we may judge from the utterances of the organ in this city, after having had time to hear from Washington, they are not going to admit that it is a good treaty for the United States without a struggle—like the Divinity Professor at Oxford who warned his class that a certain passage in the New Testament "was probably spurious, but not to be surrendered without a fight." What seems now to be foreshadowed is, that Senator Bayard's claim that it is "a permanent and satisfactory settlement," must be disputed, if only to cut down his "self-appreciation." The legal right of the American Commissioners to act as negotiators will probably, also, be again examined, and the question whether the State Department meant, in negotiating the treaty, "to antagonize the Congressional policy of retaliation," will also be inquired into. Then Pat Ford has still to be heard from. Until he has had his say, one can hardly tell what kind of treaty it is. The following parallel throws some light on the situation:

[*Tribune*, February 16.]

If the authority quoted by our Washington correspondent is to be relied upon, the treaty will be satisfactory to Americans. In fact, it is stated that we have got about all we asked for. The headland theory contended for by Canada has been abandoned, and that question will be settled according to the usage that prevails among the principal European nations, and our fishermen are to have their commercial rights in Canadian ports. If this is correct, the outcome of Mr. Bayard's undertaking will be much more gratifying than we have had reason to expect.

[*Tribune*, February 17.]

The State Department under the present Administration has been a centre of British-American diplomacy. What is regarded by the Secretary himself as a conspicuous triumph for America may be in reality a compromise and a surrender. The submission of the convention to the Senate will revive the controversy opened last December respecting the constitutional power of the President to appoint the Commissioners. The subject is one which the Senators can hardly fail to consider when the treaty is laid before them.

The wailings of the London correspondent of the *Tribune* over the transmission to the London *Daily News* of extracts from his newspaper, showing the confidential and even deferential relations existing between the Blaineites and the Irish dynamitic party headed by Pat Ford of the *Irish World*, are very amusing reading. He almost wept over these revelations in his Sunday's despatch, and begged the editor to say that there was "an error in transmission," or say something which he could show his English friends which would let him out of his scrape. We think his sufferings do him much credit, but we fear they are due rather to the social annoyance the Ford alliance causes him than real holy horror of Ford and his doctrines. Not a word of comfort does the *Tribune* give him, however, and he will have to continue to face the music at his five o'clock teas, and his dinners, and his private smokes with the Prince of Wales, because Blaine cannot be elected without Pat Ford's help, and Pat is an awful ogre in English society. The correspondent's situation is as full of horror as that of the man who went with Thackeray in a cab to dine at the Duke of Devonshire's, and was ashamed of the cab, and wanted to send it away quickly, but had to undergo the torture of an offer from Thackeray, in the presence of the hall porter and the footmen, to toss up a sixpence to see who should pay the fare.

The members of the Reading Investigating Committee of the House must have been astonished when they got Mr. Corbin before them. The *raison d'être* of the Committee is to show that the Reading Company is doing something for which it ought to be ashamed of itself, and that it ought to take the back track as soon as possible. Most of the questions put to Mr. Corbin were leading ones pointing to that conclusion. What a surprise it must have been when he said to them: "If there is no more coal mined from the Schuylkill region until we are compelled to mine it by discharging men who have come to us in our trouble and stood by us to make way for the strikers, no more will ever be mined while I have influence enough to prevent it." This was very manly, and hence very unpalatable to the questioners, but the following interrogatory and answer must have knocked them all in a heap:

"Do you mean to say, and to go on record as saying, that for that, and that only, you will not take them back?"

"Yes, emphatically, I want that to go on record. They left me and I gave them notice. It will be a pretty cold day when I disc harge men who stood by me when I needed help, for men who deserted and attempted to ruin me."

When Turgot was made Minister of Finance, Voltaire, after watching him awhile, exclaimed: "Here is a man." Something like this must be the idea that common people will arrive at after reading Mr. Corbin's testimony.

The chivalry of South Carolina has come to a sorry pass if Mr. Tillman of Edgefield District is a present representative of it. Mr. Tillman is chairman of the Reading Investigating Committee. On Thursday he asked President Keim a string of irrelevant and insulting questions charged with the rankest demagogism, which Mr. Keim very properly declined to answer. The next day he repeated the operation on President Corbin, with no better results, although Mr. Corbin did tell him, when he called for a statement of the Reading Company's assets and liabilities, that it was none of his business. Mr. Tillman was ably seconded by Mr. Anderson of Kansas, who wanted to know, among other things, where Mr. Corbin had his washing done. Mr. Corbin's refusal to answer this question put a stop to an interesting line of inquiry, such as, how many shirts he sent to the wash each week, whether he paid his washing bills promptly, and whether his washerwoman used Pearline or Ivory Soap. Then Tillman took up the wondrous tale, and asked when the Reading Company paid its last dividend. Mr. Corbin said in 1876. "And it will be a cold day when it pays another," added this representative of a chivalrous

people. Imagine John C. Calhoun bullying a witness in this fashion! "I supposed," said Mr. Corbin, "that this was a fair investigation. I did not think you came here to personally abuse everybody connected with the Reading Railroad Company, and to call them thieves and robbers." Mr. Tillman denied that he had done this, and made the obviously exaggerated statement that he (Tillman) "was a gentleman, and could answer for what he had said or done." Then Mr. Corbin took out of his pocket a clipping from the report of the previous day's proceedings, and read an extract from Tillman's blackguardism towards President Keim, and asked him whether that was a correct report; but Tillman declined to answer.

The passage read by Mr. Corbin was reported in the New York papers as follows:

"Where do you expect to get your money to pay the interest on your bonds? Where do you expect to get your money to keep you out of bankruptcy again? It seems to me that you are robbing the stockholders of your company, and robbing the public, to pay fat salaries to a set of officers who appear not to know anything about the companies they are supposed to serve at all. The miners may starve, the public may pay two prices for coal, but the officers are paid big salaries to know nothing or very little, so far as this Committee can find out. Now, I would like the witness to answer how such a state of things can exist. There is said to be honor among thieves; how far this applies to the case of these officers, I don't know.

When this Committee makes its report, we trust that some member of the House will be brave enough to move a vote of censure upon the Chairman for insulting the witnesses, and upon the whole Committee for permitting him to do so.

The *Tribune* still continues to publish interviews with Republicans who are determined to have Blaine whether he wishes it or not. Gen. Hovey of Indiana says he will be "nominated by acclamation." Senator Riddleberger says "Virginia is sure for him." It quotes the *Irish World*, too, as protesting strongly against Blaine's withdrawal, and urging the Republicans to nominate him again as a condition of Irish support. The Pittsburgh *Times* also wants him; so do the Rochester *Democrat*, the Burlington (Vt.) *Free Press*, and several other newspapers. All this has to be taken in connection with the following remark on the editorial page:

"Finally, the Mugwumps and free-trade Independents manifest a disposition to dance on Mr. Blaine's political grave, as they think, and to boast that their individual hostility has killed him, and will kill any other candidate who does not please them. This is not unlikely to incline Republicans to inquire whether a genuine Republican can possibly support any candidate whom they would not assail as malignantly as they have assailed Mr. Blaine."

It is of course hard to say what the foregoing extract means, but probably that if the Mugwumps show signs of supporting any Republican nominee other than Blaine, the Blaineites will "knife" him. This has been long anticipated, and in fact is very likely to happen. No Republican can be allowed to carry any State in which Blaine was beaten, especially this State.

Mr. G. W. Childs of Philadelphia has been frequently urged, during the past two years, to accept a nomination for the Presidency if it were offered to him. He has more than once declined to entertain any such proposal, but as it has been repeated since Mr. Blaine's Florence Message, he has refused it again, but how differently from Mr. Blaine! The latter simply says his name "will not be presented" to the Convention, and this is all. Mr. Childs, on the other hand, says: "As to declining and refusing to be a candidate for President, his mind is firm and unalterable"; and "he repeats his refusal to be a candidate or to be voted for, and adds that he would be compelled to decline the office, honorable and exalted as it is, if by any chance, in the chapter of unforeseen events, he should happen to be elected." This is the way to decline an office when a man really means to decline it. There is here no room for doubt or misunderstanding about Mr. Childs's position. No pleadings or tears from Pat Ford or any other admirer will move him one inch. There will be no use in preparing "acclamation" for him, or hiring "shouters" for him in the Convention. There will be no first, second, or third explanation of his utterances. We ought to add that this refusal makes Mr. Childs an almost unique figure in American history. We believe Gens. Sherman and Sheridan are the only other Americans who have declined a Presidential nomination with this clearness, decisiveness, and unshakable firmness.

Declining the Presidency has various shades and classifications which the public are not slow to recognize. For example:

MR. CHILDS	Would not accept the Presidency if actually elected.
GEN. SHERMAN (in 1884)	If nominated in spite of his declination, the Convention will hear something that will be disagreeable.
GEN. SHERIDAN	Would not accept a nomination if tendered to him.
MR. BLAINE	His name will not be presented to the Convention, but he congratulates the party that he got 200,000 votes more than Folger did in New York.

Other varieties will appear from time to time as the day of the Convention draws near. The most common will be that of the candidate who will not allow his name to be used unless the nomination is "spontaneous." The number of those who will not feel hurt or discomposed in the least degree if they are not nominated, includes all the rest.

The *Farmers' Voice* of Chicago, a sixteen-page weekly, is pouring hot shot into the tariff. The number of "inequalities" in that arrangement of taxation that the *Voice* discovers is almost equal to the number of dutiable articles. The greatest inequality of all, however, is the general fact that the farmers pay about two-thirds of the cost of maintaining a system of "protection" and get nothing in return. The *Farmers' Voice* publishes at length the memorial of the Farmers' Alliance of the State of Nebraska, which declares, among other things, "that our agricultural products are sold in the open markets of the world in competition with the cheapest labor in the world, while the manufacturer, through the operation of protective tariffs, receives a bonus of 25 to 100 per cent. on his goods." Why does not William Walter Phelps send these benighted people a copy of his speech showing how a home market is secured to the American farmer by the tariff? Evidently these Nebraska agriculturists are in a parlous state. They do not understand that the home market might be taken away from them by foreign wheat-growers if they did not pay an average tax of 45 per cent. on all the dutiable goods they buy.

Mr. William Lloyd Garrison made an address before the West Side Club at Providence a few days ago on the subject of the Treasury surplus and the tariff. "The last ditch of protection," said Mr. Garrison, "is the low wages scare," and then he gave the following bit of testimony, which is very much to the point:

"My friend John Graham Brooks, who went to Germany with protective proclivities, was astounded at the explanation given him why the manufacturers wanted a tariff. 'We need it,' they said, 'to protect us against the highly paid labor of England.' 'Say that again,' said Mr. Brooks. 'I don't understand you. Where I came from we ask protection against the low wages of England.' It took but little reflection for him to see that the German had good reason to fear the Englishman. The talisman of success remains with the nation paying the highest wages, and consequently commanding the cheapest labor."

This tallies remarkably with the facts brought out in Consul Schoenhof's recently published report to our Department of State, showing that the American workingman in the textile industries commands higher wages than the English, because, as a general rule, he does more work in a given time, and that he does not really get as high wages by comparison as his superior efficiency entitles him to. In other words, if both American and English operatives were paid by piece-work, the pay of the former would be relatively greater than it is.

We must say that the wool editor of the *Tribune* ought to look after his duties more carefully, for whereas the leading article on Monday was a powerful attack on Mr. Mills of Texas (whom the *Tribune* commonly calls "Premier" Mills, to distinguish him from other Millses who are not premiers), on account of his speech at Providence on the wool tariff, another article in the same paper, discussing our trade with Australia, says:

"A most discouraging feature of the trade is that there is no home trade for returning vessels, beyond three or four cargoes of wool a year. 'If we could import Australian wool,' says one of the traders, 'and could have a home trade equal to the outgoing one, we could make our round charters much cheaper and the out-bound rates of freight lower, and could soon take a fair share of trade. The Australian wools are long and fine, entirely different from those here; they are the finest staple of the world. But, owing to the lack of return trade, rates are higher; at the present time, therefore, the share of the United States trader in manufactured goods is not 10 per cent. of what goes to the colonies. Hence our great disadvantage. We could to-day charter vessels on the basis of forty-five shillings per ton, out and back, if we had the return business, but with no home freight it costs thirty shillings out alone.'"

Is it not plain that this is a covert attack on the tariff, and that it was smuggled into the paper without the knowledge of the wool editor? Is it not as clear as A B C that if the wool tariff were repealed so that we could import those Australian wools, so long and fine and so entirely different from our own, "the finest staple in the world," we might increase our trade with the "huge island continent" of the antipodes to an enormous extent? And is not the suggestion equally plain that an increase of trade with Australia would be a good thing for the country? Such misleading insinuations ought not to be allowed—certainly not in the same issue of the paper that chastises "Premier" Mills for wool and woollen heresy.

The speech of Mr. Mills at Providence vindicates his title of "Premier" to satisfaction. He promises that the wool tariff shall be abolished if the Committee of Ways and Means can accomplish that end. This is the first hearty and uncompromising statement that has been made by high authority since the President's message was delivered. It promises a real reform and a reduction of the surplus on correct principles. Protecting manufactures with one hand and raw materials with the other is such a travesty of common sense that the human mind recoils in the effort to grasp it. Protection had been going thirty-five years in this country before anybody thought of putting a tariff on wool; or if anybody had thought of it before, the various Congresses from 1789 to 1824 had cast it out as too ridiculous to be considered. In the last-named year, wool secured recognition for the first time, and from that time to this it has been the principal marplot of the revenue system, with the curious result, as Farmer Grosvenor showed in his book, of crippling wool-growing and woollen manufacturing equally and uniformly, so that the highest prices of domestic wool have always been in the low-tariff periods and the lowest prices in the high-tariff periods. Now if "Premier" Mills and his colleagues succeed in casting out this evil spirit, they will render the greatest possible service both to tariff reform and to industrial progress.

One of the funniest outcomes of the agitation against poverty is a claim of copyright, or rather trade-mark, in the name "Anti-Poverty Association," made by Dr. McGlynn. He has moved for and obtained an order to show cause why Henry George's men, Post and Croasdale, should not be restrained by injunction from using the name for their new association. Should he fail, though McGlynn may suffer, the Anti-Poverty cause will not, for the attack of two such organizations on this monster evil of human society must be more effective than that of one only. But, of course, it will cost more to abolish poverty through two organizations than through one.

Henry George's long statement of the causes for the separation of himself and McGlynn contains nothing new. It merely amounts to a confirmation of the report that they have parted company because McGlynn and a few others wished to run a Labor candidate for the Presidency this year on the general plan of the "Butler business over again," and George refused to be a party to such a trick. It is made very plain now that McGlynn and his allies formed the plan as a means of subsistence, and that George opposed it on the much more creditable ground that it would be a fraud upon the public and an injury rather than a benefit to the workingmen. The fundamental cause for the separation undoubtedly is that the Anti-Poverty humbug has ceased to pay, and something else must be found to give its promoters a living. Some of them are now charging the McGlynn faction with misappropriation of funds, but that is a charge which can be brought with equal force against all the charlatans and adventurers who have been figuring as leaders in the movement.

The Hartford *Courant* furnishes a notable comment on the taxation of moneyed capital. The law of Connecticut requires that mortgages shall be taxed against the mortgagee, even though the mortgaged land may be in another State. The Connecticut Tax Commission last year recommended that this class of mortgages should be exempted from taxation, because the property which made the mortgage good was out of the jurisdiction, and also because the tax could not be uniformly collected, there being no means of finding such mortgages unless the holders voluntarily returned them. After a hot debate the Legislature rejected the amendatory bill. And now the *Courant* records that the public authorities of the town of Simsbury, "after full discussion and consideration," have deducted this class of mortgages from the grand list. In other words, they have voted "to suspend a State statute." The *Courant* thinks that it is more likely that the law will be repealed than that proceedings will be taken to coerce the town of Simsbury.

"Party before Country" is the title with which the Milwaukee *Sentinel* introduces an article on the gross partisanship of the Democrats in the House of Representatives, who are reported to contemplate the passage of a bill admitting into the Union New Mexico—at the same time with Dakota, Montana, and Washington. "The population of New Mexico," says the *Sentinel*, "is a kind of population that is not yet fit to assume the responsibilities of Statehood. A majority of its people are ignorant Mexican greasers, speaking no language but a patois of Spanish and Indian. They are utterly unfit for any form of American government, except such as exists under the Territorial condition. New Mexico should not be made a State until the greaser element of its population ceases to be predominant, or has been educated so that a fair proportion speak and read the English language." We heartily agree with this view, but must remind our Milwaukee contemporary that thirteen years ago, when the Republicans had more than a two-thirds majority in the Senate and House of Representatives, both branches passed a bill for the admission of New Mexico, the measure only failing because the Senate amended the House bill so late in the session that adjournment came before an agreement was reached. The *Sentinel* thinks that the Democrats show themselves "partisans whose sole consideration is party," when they propose to admit as a State "the greasers of New Mexico, whom they feel sure can be made to support the Democratic ticket." But what were the Republican members of the Forty-third Congress, who, when the Territory was far less fit to be a State, voted to admit "the greasers of New Mexico," who they then felt sure could be made to support the *Republican* ticket? Will the redeeming process of outnumbering the greasers only end in Democratic supremacy? And if so, must New Mexico always be kept in a Territorial condition?

Mr. Pearson, the Postmaster, had the good fortune to receive a valuable testimonial of efficiency from Tammany Hall last week. The Committee on Organization passed a resolution calling for the Postmaster's removal, on the ground that he is "outrageously mismanaging his office," that his letter-carriers "are notoriously underpaid and overworked," that "any unfortunate letter-carrier who has complained of unjust treatment has been ruthlessly rejected from his place," and that the man who is responsible for all these evils is Mr. Pearson, "than whom, excepting in Russia, a greater autocrat does not exist." Precisely what the provocation for this impassioned outburst is, was not indicated during the debate, but any one familiar with the processes of the Tammany mind will have no doubt that the trouble has sprung either from the loss of a place in the Post-office by some Tammany worker, or the refusal of Mr. Pearson to put some such worker in a nice berth. Tammany's hunger for possession of the New York Post-office has been increasing steadily for three years, and at times it becomes too painful to be borne without loud outcries.

Dr. Morell Mackenzie reiterates his belief that the Crown Prince's disease is not cancer, and that no trace of cancer has ever been detected by microscopical examination. Other accounts are contradictory, but the fact remains, and it impresses the public both in Germany and elsewhere probably more than the reports of the doctors, that the Prince grows somewhat worse from month to month, and that a more formidable operation than the last one is now talked of. He may yet recover, as the whole civilized world hopes he may, but he has not as yet entered on the road to it. Prince William, his son, has taken occasion—we presume, in view of the situation—to deny publicly, as slanderous, the charge that he is a mere soldier, and has a feather-headed longing for war for war's sake,

VOTING AGAINST THEIR CONVICTIONS.

THE Senate came to a vote on the Blair bill on Wednesday week, and passed it by a vote of 39 to 29—a marked change from the two previous records of 33 to 11 in 1884 and 36 to 11 in 1886. Allowing for pairs, 43 Senators were for the bill and 33 against it. Of the 39 Republican members of the body, 26 were for the bill and 13 against it. Of the 37 Democratic Senators, 20 were against the bill and 17 for it—a clear majority even of the Democratic Senators from the old slave States, in whose special behalf the bill has always been urged, being against it. In other words, if the decision had been confined to the Republican Senators, the bill would have passed, 26 to 13, or by exactly a two-thirds vote; while if it had been confined to the Democratic Senators, it would have been rejected, 20 to 17.

Gen. Hawley, Republican Senator from Connecticut, closed his powerful speech against the bill on Tuesday by expressing the "wish that every Senator would vote upon it just exactly as he feels about it." Mr. Hale, Republican Senator from Maine, who made a vigorous assault upon the bill the next day, closed by declaring his belief that many of those Senators who had heretofore voted for the bill were now beset with doubt and fears, and, if they cast their votes in accordance with their present belief, would be arrayed against it.

The Blair bill is, in its far-reaching consequences, one of the most important measures passed by the Senate since the war. Two-thirds of the Republican Senators voted or were paired in favor of its passage, yet it is notorious that of these twenty-six there are not more than six who honestly believe in the wisdom of the measure, or who sincerely desire its enactment into law. It has been supported on the Republican side during the discussion by its author in several characteristically "cranky" speeches; by Mr. Bowen of Colorado, a weak Senator, in a weak speech; by Mr. Stewart of Nevada, in a curiously illogical speech; and by Mr. Evarts of New York, in one of those remarkable utterances which lend weight to the recent remark of one of his Republican colleagues that he "never knew Mr. Evarts to have clear ideas on any subject." Mr. Hoar of Massachusetts has advocated Federal aid to Southern education, in one form or another, for many years, and may be credited with representing his honest convictions in his affirmative vote.

But Senator after Senator voted publicly for a bill which they had privately admitted ought not to become a law. Here are a few illustrations:

A Republican Senator from a New England State told another Senator early in January that he "had become convinced that the bill was unwise, unnecessary, and wholly vicious, but he felt constrained to vote for it in deference to the sentiment of his State." It became clear within a month, through the tone of the press and the letters of educators, that the bill was not endorsed by the public sentiment of his State. He then said that he should vote for the bill "out of deference to his colleague," who had always supported the policy, and he did so vote.

The two Republican Senators from another State agreed in the opinion that the bill was a bad bill and ought not to be supported, but they voted for it because somebody had got the Legislature of their State to pass resolutions endorsing the measure, although these resolutions were rushed through without consideration, and represented no intelligent public sentiment.

A Republican Senator from a Western State recently said: "When I first came here I felt very strongly that it was the duty of the Government to lend its aid in the education of the colored people. I feel somewhat so yet; nevertheless, I confess to a very great feeling of doubt as to the propriety of passing the bill." He voted to pass it.

A Republican Senator from another Western State recently said: "There is much good sense in the arguments urged against the bill, but a vote against it would be regarded, without explanation, as adverse to the cause of education. I cannot place myself in that position." He voted for the bill.

A Republican member of the Judiciary Committee, to a suggestion as to the unconstitutionality of the bill, answered: "What's the use of talking about the question of constitutionality? If the people want the bill, let them have it." He voted for the bill.

A number of other Republican Senators, who had voted for the bill once or twice before, have admitted over and over again during the past month that they "were sick of the bill, and thought it ought not to become a law, but could not find excuse for reversing their former action." They all voted for it, not possessing the manliness shown by Mr. Spooner of Wisconsin, who was not ashamed to admit by his vote that he had learned something during the past two years.

The decadence of the Republican party has never been more strikingly shown than in the passage of this bill by two-thirds of the Republican Senators, although not above six of the twenty-six who voted to make it a law believe that it ought to become a law. Fancy a Republican Senator in Lincoln's day finding it necessary to implore his party colleagues to vote upon a bill just exactly as they felt, and then seeing them vote the other way! Fancy Senator William Pitt Fessenden voting for a bill "out of deference to his colleague"! Fancy Senator Charles Sumner voting for a bill which he believed to be a bad bill because the Legislature of his State had been inveigled into a hasty endorsement of it! Fancy Senator William H. Seward of the "irrepressible conflict" period deliberately voting for a bill, which he had once carelessly favored, after he had become convinced of its pernicious character, because he lacked the courage to explain his change of mind! Fancy Senator Salmon P. Chase ridiculing the idea of talking about the constitutionality of a bill!

It is not believed that the Blair bill can become a law. But why? Only because the Democratic party controls the lower branch of Congress and the Executive Department. It is not thought that the bill can get a majority in the Democratic House; if it should squeeze through the House by a combination of most of the Republican members with a minority of the Democrats, the greatest confidence is expressed that the President, who interposed his veto to the Texas Seed Bill a year ago, would in the same way block the equally unconstitutional Blair bill now.

"I am willing to see the bill defeated by any of the constitutional means," said Gen. Hawley in concluding his speech, "whether by the House, by the Senate, or by the President." It has passed one of these stages by a two-thirds vote of the Republican Senators. If the Republicans controlled the House, it would pass the second stage. If the Republicans had elected their candidate to the Presidency in 1884, it would pass the third stage, and become a law. In other words, the salvation of the nation from what Gen. Hawley properly considers a measure to change the whole theory of our government, is found in the fact that the Republican party was beaten in the election four years ago.

OUR UNHAPPY CONSULS.

THE efforts of Mr. Belmont during the last Congress to improve the consular service—efforts which, we understand, are to be repeated during the present session—entitle anything he may say on the subject to the most respectful attention. It seems to us, however, judging from his article in the *Forum*, that the Chairman of the Committee on Foreign Affairs hardly appreciates the seriousness of the evils which he aims to correct, or perceives how radical must be any measures able to remove them. Mr. Belmont's chief points are (1) that the salaries paid our representatives, as compared with those of other nations, are inadequate to secure the services of competent men, and (2) that our system of paying a large proportion of the consuls by fees instead of salaries, as well as permitting those so paid to be engaged in trade, tends to produce a dishonest rivalry between contiguous consulates, in order, by winking at fraudulent invoices, to attract the patronage of shippers, and hence increase the fees. The latter evil might, indeed, be abolished by the means proposed; but increase of salaries, the system of appointment remaining the same, would, it seems to us, only make the places more valuable as spoils, and hence still further diminish fixity of tenure.

We may seem to be advocating a Utopian remedy when we say that the first condition of an honest and efficient service is permanence of tenure; and the second, the adoption of some method by which appointment shall no longer be given to the henchmen or dependent relatives of politicians. These are, indeed, commonplaces of civil-service reform, but, from ignorance of the duties of consuls, the public fails to perceive that while, in all other branches of the public service, the realization of these principles is *desirable*, in the consular it is *essential*. With ordinary ability and industry, anybody can become a respectable postmaster or department

clerk, while it requires unusual faculties and training to make a good consul. But the main reason is that consular officers have innumerable opportunities to defraud the Government and the mercantile community, which are rarely found in other branches of the civil service. Frauds enough, no doubt, occur in connection with whiskey prosecutions, and star-routes, and post-traderships; but there is practical security against these in the fact that they are committed almost within sight of the newspapers and the business public, while consuls act thousands of miles away, and though they may be watched by their official superiors as carefully as circumstances permit, they are almost entirely free from the much more effective scrutiny of the public.

If a man could enter the service with the confidence he would have if in the employ of a private firm, that he would keep his place during good behavior, the temptation to ill-conduct of any kind would be more than counterbalanced by fear of detection and consequent dismissal. But our system directly encourages dishonesty, first by appointing men of all degrees of incompetency or inexperience in mercantile affairs, and then by saying to them, in effect: "At the end of four years (more or less) you will be kicked out of your position. Your capacity and devotion to the interests of the Government and of your countrymen individually (if you should display such qualities) will make little difference in your fate. Your honesty (if you are honest) will not keep you in; your rascality (if you start that way or yield to temptation) will hardly be detected and acted upon before the end of that time. Even if you should be dismissed on this account a little sooner than you would otherwise be, your friends would believe that it was all 'politics,' so that your future in private life would not be injured. So, you see, by being conscientious you have nothing to gain, and, as you will soon learn, everything (save *self*-respect) to lose."

Now this is a devilishly good argument, even if the newly appointed consul were fresh from a divinity school; how much more so if, as is generally the case, the man has been "on the make" for years or decades before his appointment, and has got the place after a long-continued competitive examination in political unscrupulousness. It used to be said, not by the enemies, but by the friends, of a certain ante-bellum Governor of a Northern State, whose election, owing to accidental circumstances, was held to be of advantage to the party at large, that, being offered at the close of his term his choice between a European legation and an important consulship, he chose the latter "because he was poor, and needed to lay by something." As the salary was far from large, it is obvious that there must have been large pecuniary advantages incident to the position, or his praiseworthy purpose would have remained unfulfilled. At that period, indeed, the home authorities gave the consuls a very loose rein; their accounts were passed with little or no examination, and opportunities for illicit gain, if not more numerous, were at least much less exposed to detection than they now are. Cases were known in which consuls' accounts of thousands of dollars per annum were allowed on forged vouchers and receipts of mythical shipwrecked seamen—a speculation which to-day, owing to improved inspection facilities, might turn out less profitable. But all who have been brought in contact either with ex-consuls (the honest ones), or with persons engaged in foreign trade, are aware of the practically innumerable ways in which consuls still can (and do) cause loss of money and vexation of spirit.

The consular career of a Tilghman or a Badeau occasionally becomes notorious through the newspapers; but purely commercial annoyances require too much explanation to make it worth the while of the press to discuss them. In many cases, too, it is impossible to convict a consul of a dishonest motive, although the aggrieved party may feel sure that his only object was blackmail. If convicted of error in interpreting the law, the excuse of ignorance, in a person often without experience or training, is very plausible.

In conclusion, we venture to suggest to Mr. Belmont a reform the operation of which would be so slow that the politicians would have ample time—a generation or more—to get used to it, yet which would eventually purify and immensely improve the service. The law provides for twelve consular clerks, who hold office during good behavior. The supposed object of this provision was to train young men to fill consular offices; but observe how beautifully it works. When a clerk is appointed to a consulate, he loses the benefit of the good-behavior clause, so that, after a few years, he is turned on the world in even worse condition than the political consul, for the latter may, meantime, have "made his pile," and at any rate can return to that station of life from which the Government saw fit to call him. The clerk's alternative (if he is allowed one) is to remain for ever at a salary of $1,200 a year, which is hardly a future to attract a man of conspicuous ability or energy. Our proposal is simply this: that when a consular clerk is promoted to a consulship, and is subsequently removed, he shall resume his former status. The consequence of this would be the gradual increase in the number of consular clerks, until the Government would be enjoying the services of an unnecessarily large number. The public, however, would not permit competent men to be idle in the service, and would insist that a larger proportion of them should be appointed to consulships. And eventually, we think, the reform sentiment would be so strong that appointments of untrained men would be as rare as they now are in the military service, in which the Government schools serve the purpose which the institution of consular clerks was intended to accomplish for the consular.

BROKERS' GLOOM.

Among the interesting social phenomena of the day none is more curious than the influence which the prevalence of gloom among stock-brokers has on the general community, touching the condition of trade and finance. When business is dull for any great length of time in Wall Street—that is, when very few people are purchasing railroad stocks, and there is consequently a heavy falling off in brokers' commissions—a feeling is very soon diffused through the whole community that times are very bad, and the future very dark, and the need of economy very pressing. Nothing suffices to make head against this gloom. The retail trade of the city may generally be very good; the exports, and, *pace* Mr. Blaine and Mr. Edmunds, the imports, as heavy as usual, or heavier than usual; work may be abundant, wages high, the banks full of money, but if the stock-brokers groan, the rest of the population are apt to feel pains in their own bones.

This is the more curious because everybody who thinks much about the matter knows very well that dulness in Wall Street, whatever its cause, means actually that but few stocks are changing hands. It does not mean that many stockholders are eager to sell, but simply that very few are eager to buy. It does not mean that any stockholder is in pressing need of money, or has any difficulty in borrowing money, or is in any way distressed in mind, body, or estate. Nor does it mean that the investors are not investing, but keeping their money lying idle, because simple investment furnishes but a small part of a broker's business, and may be as good as ever in the gloomiest times without at all diminishing the gloom. What makes bad times in Wall Street is the absence of speculation, or the purchase of large quantities of stocks with the view of selling them again immediately, or very soon, to somebody else, who, in turn, also means to get rid of them as soon as possible. This process of quick transfer from hand to hand of course might be active to the verge of riotousness, without indicating anything positive with regard to the real condition of general business. As a matter of fact, it has mostly been witnessed after a period of prolonged prosperity, which has begot a speculative spirit, and furnished people with plenty of money to speculate with. But it is not a process which in any way increases the wealth of the community. Consequently, its disappearance does not indicate any diminution in the wealth of the community. What hinders it just now, we imagine, is simply a dread of Wall Street as a gambling-place in which the cards are marked, or the dice loaded, and in which neither skill nor experience has any special value. But the only persons out of pocket by its absence are the brokers, who get their commissions on all transfers, whether the buyer or seller makes any money by the transaction or not.

But the brokers, it may be said, are but a small body; why, then, should any diminution in their income produce a widespread impression that the times are hard, and make even the owners of assured fortunes feel reluctant to spend money? Well, the reason probably is that they are the class whose influence is most felt in what may be

called the market for luxuries. There is an aleatory quality about their incomes—that is, a tendency to great extremes, and a liability to sudden changes—which seems to beget in all men exposed to its influence a strong disposition to lavish expenditure. Another feature in their earnings, too, which operates in the same way, is that the same amount of labor may bring in either a very small or an immensely large return. It takes very little more time or thought to sell $1,000,000 worth of stock than $10,000, but the gains in the former case are one hundred fold greater than in the latter.

The general result is that the brokers, taken as a whole, are the most free-handed class we have. No class makes itself more markedly felt at Delmonico's, the theatres, the carriage-maker's, the tailor's, the wine merchant's, the jeweller's, the furrier's, the horse-dealer's, and the clubs; and when the best customers begin to retrench in all these places, a loud lament over the times soon begins to be heard in the land. The late Lorenzo Delmonico used to say that he could always tell whether business was good in Wall Street by listening to the popping of the corks in his restaurant, and we may be sure they always popped more for brokers than for anybody else. Now a falling off in the demand for luxuries affects general opinion about the state of trade much more quickly than a falling off in the demand for the ordinary necessaries of life. The reason is that there is about all consumption of luxuries a good deal of éclat. They are rarely enjoyed secretly, or even privately. The man who fares sumptuously every day wants the world to know it, and invites many to share his pleasure with him. A fine carriage and horses, too, or a fine house, are public proclamations of affluence. So are diamonds and other precious stones. So is a large wardrobe. When any individual who has been in the enjoyment of these things lays them aside, or refrains from them, or groans over the possession of them as something he cannot afford, all his friends perceive it and speculate as to the cause of it. When many do it at the same time, the air gets filled with sounds of woe from all the purveyors of good things.

It is useful at times to remember this close connection of speculation in stocks with good living, when one hears lamentations over the condition of the market, and to remember also that the market may be terribly dull, even for long periods, without much worse results than temporarily depriving a body of capital fellows of yachts, and horses, and carriages, and French cookery, and good claret and champagne.

THE ENGLISH TROUBLES.

Although it is still improbable that the Tory Ministry in England will dissolve Parliament and lay their policy before the voters any sooner than the expiration of the customary term, nevertheless the signs that they may be driven to it multiply. The Liberal Unionists on whose support their ability to avoid a dissolution depends, still held firm at the last division, but things are occurring which must in some degree shake their resolution. The various boroughs into which the city of London is now divided have hitherto stood by the Conservatives on the Irish question pretty steadily, but the result of the election in Southwark appears to have astounded both parties. The Liberal majority there has jumped, on a new registration, from a little over 100 to more than 1,100 in a vote of 6,000. In one of the Edinburgh divisions Mr. Buchanan, who was returned at the last election as a Liberal Unionist, has been converted to Home Rule by the coercion policy in the interval, and resigned his seat in order to give his constituents an opportunity of passing on his change of opinion. He, too, has been again elected, showing that the majority of the voters have followed him into the Gladstonian camp.

These things, it is true, are merely "straws," but they are straws of great significance, and they are making a deep impression on the mind of English politicians; all the deeper because the news of them came almost simultaneously with the great oratorical triumph achieved in the House of Commons by the Liberals through Gladstone and O'Brien—Gladstone's speech in particular being reported as one of the finest, if not the finest, he has ever made. The scene in the Commons when Balfour had to face a torrent of fierce and, it is said, very skilful invective from his late prisoner, O'Brien, is represented as extremely dramatic, and was one to which Balfour's light, chaffing, cynical tone was singularly unsuited in the eyes of a democratic public.

In truth, Balfour is now probably beginning for the first time to realize the value of the advice Lord Hartington gave the Ministry—not to proclaim the National League under the Coercion Act, but reserve the powers which this act gave for positive and well-defined criminality, such as outrages, and boycotting, and actual resistance to the officers of the law. The proclamation of the League, and the consequent prohibition of its meetings, led through the inexorable logic of events to the very thing from which the Liberal Unionists naturally shrunk—the prosecution of political Parliamentary opponents before magistrates removable at the pleasure of the Crown. It is now two hundred years since any English minister has ventured to pursue criminally politicians for saying things which the Opposition in the House approved of and agreed with. This Balfour has not only done, but has sought to aggravate it by treating them as ordinary criminals, and subjecting them to such indignities as prison rules permitted. In other words, he has infused a spice of personal hatred and contempt into his treatment of men who vote against him in the House of Commons, and whom the Liberal party support.

This reintroduction of ferocity into party politics in the England of to-day is, of course, an immense blunder, but it is a blunder which the proclamation of the League made necessary. If the Ministry had not used vigorously the powers given them by the Coercion Act, the desperate fight they made for its passage would have seemed a piece of great folly. But they might have confined themselves to pursuing small criminals. When they proclaimed the League, they had to attack orators and editors, and when they began to attack orators and editors who had an English party at their back, they inevitably recalled the old Tory methods of the days before the Reform Bill, when Leigh Hunt had to go to jail for calling the Prince of Wales a "fat Adonis." The meeting between Balfour and O'Brien in the House—that is, between the prisoner and his jailer—was therefore not only a dramatic, but a disagreeable scene to most English Liberals. O'Brien is, to be sure, a noisy and excitable person, but he is sincere and self-sacrificing, and it shocks people to have him treated as a common pickpocket because a jaunty young aristocrat like Balfour disapproves of his language on the platform.

The charge that O'Brien's and Blunt's language excited common people to the commission of crimes and offences is an old charge, which the Tories have always in every agitation brought against their political opponents. In every agitation there are ignorant or impulsive men who resort to violence under very slight stimulation from the press or the platform; but Liberals have never, in any country, admitted that this was a good reason for silence. The Republicans at the North were in this way made responsible for John Brown's raid into Virginia, and John Bright himself was accused in 1866, during the movement for an extension of the suffrage, of being dangerous to the public peace. He actually did say that if the popular demands were not conceded, "a great exhibition of opinion" might before long be converted into "a great exhibition of force." He then repelled the charge against himself in a memorable speech in London by saying:

"These opponents of ours, many of them secretly in the press, have charged us with being the promoters of a great and dangerous excitement. They say we are the source of the danger which threatens; they have absolutely the effrontery to charge me with being the friend of public disorder. I am one of the people. Surely, if there be one thing in a free country more clear than another, it is that any one of the people may speak openly to the people."

He then added that he was only warning of their danger men who were living on the side of a volcano, and ended by declaring that "the Tory party was the turbulent party of this nation." He described the turbulence and disorder then as now prevailing in Ireland, and described the naval and military preparations made to put it down, and hurled again at the Tories the taunt that "they had no remedy for this state of things but that ancient, and rude, and savage remedy, the remedy of military force." He also quoted, from an address from a Swiss convention to our Government after the war, a passage which he called "an expression of true philosophy and true statesmanship," to the effect that "unfinished questions have no pity for the repose of nations." This is as true of the existing situation as it was of that of twenty-two years ago.

The Irish question is emphatically one of those "unfinished questions" which have no pity for the repose of nations; and to try to keep it out of sight by putting half-a-dozen agitators into prison dress and making them pick oakum, is a bit of the childishness which has been a characteristic of Tory statesmanship ever since the conservatives of the world began to fight with the printing-press and call for silence.

A WARWICKSHIRE WORTHY.

WARWICKSHIRE, February 1, 1888.

Two days ago a group of some twenty persons were gathered together in the old Church of St. Mary's at Warwick, to do honor to one of Warwick's most distinguished sons. Hitherto, no visible record in the ancient midland town has reminded the inhabitants, or told the thousands of visitors who find their way thither every year, that Walter Savage Landor—of whom it was said that "he wrote English better than any man living, and his Latin was as good as his English"—was born in the solid, red-brick, Queen Anne house just outside the East Gate. Nay, many a dweller in Warwickshire only knows the name as connected with an honored member of the family who now owns the small remnant of the Tachbrook property sold by Landor in 1809 to his brother Henry. Verily, a prophet has no honor in his own country. But at last the great writer's family have taken the matter in hand. The words "Landor, Born 1775," over the door of the red-brick house will henceforth remind the passer-by who it was who saw the light in its panelled rooms, and the beautiful monument erected by his eldest surviving son in St. Mary's Church will perpetuate the memory of a master of English, the fellow-countryman of William Shakspere and George Eliot.

It was Landor's birthday, January 30, that had been chosen for the unveiling of his monument. As the first flakes of a snow-storm shattered down, darkening the great windows of the church, and the scanty knot of friends huddled together in their furs round the stoves in the nave, his own verses, composed on one of his birthdays, and among the best he ever wrote, appeared almost prophetic:

> "The day returns, my natal day,
> Borne on the storm and pale with snow,
> And seems to ask me why I stay,
> Stricken by Time and bow'd by Woe.
>
> "Many were once the friends who came
> To wish me joy; and there are some
> Who wish it now—but not the same;
> They are whence friends can never come;
>
> "Nor are they you my love watcht o'er
> Cradled in innocence and sleep.
> You smile into my eyes no more,
> Nor see the bitter tears they weep."

And yet, as we looked on the little assemblage, we thought it was just such an one as Landor himself would have cared for—very personal, very local. There were his nieces, who held him in warm affection apart from all admiration for his genius; a grandniece and grandnephew. Miss Percy had come from Guy's Cliff, where Landor must have wandered a hundred times about the Saxon Hermit's Cell. Lady Warwick had come from the Kingmaker's Castle to honor him who was known at Oxford as the "mad Jacobin." Two American ladies were there, whose presence reminded us that by our transatlantic cousins Landor has always been more warmly appreciated than by the public of his own country. There, too, were the mayor of his native town, a few neighbors, a few local clergy, a few friends of the family, and, lastly, a link with the warmest friendship of Landor's life, there came the venerable master of the Leicester Hospital (that enchanting labyrinth of black timbers, white panels, bears, and ragged staffs at the West Gate), at once the son-in-law and the nephew of Robert Southey. It was fitting he should be there, and, with a delightful touch of graceful sentiment, he carried in his hand a copy, bound in finest red morocco, of the rare edition of the ten 'Idyllia Heroica,' printed and published at Landor's own expense at Pisa in 1820. This copy the author had given to his friend Southey, and on the richly tooled cover we saw Landor's monogram, and looked with no little interest at a number of Latin notes and corrections in his handwriting scattered throughout the pages.

The little ceremony was simple enough: a few well-chosen words from the husband of one of Landor's nieces, as his surviving sons could not be in England; a word or two from the Vicar of St. Mary's. Then, as the red curtain fell, it revealed a recess of rich, brown-streaked Derbyshire alabaster, sunk deeply in the wall of the tower which Christopher Wren rebuilt, and in the recess the bust of this Warwickshire master of English prose resting on a book, with the simple words below, "Walter Savage Landor, born at Warwick, Jan. 30, 1775, died at Florence, Sept. 17, 1864." As his nephew-in-law well said, quoting a passage from 'Pericles and Aspasia'—those volumes, so full of pregnant sayings, of sonorous and perfectly balanced sentences: "The monument of the greatest man should be only a bust and a name. If the name alone is insufficient to illustrate the bust, let them both perish."

Save for the one exception of our American friends, the little company was, as we have said, eminently local, and we felt that Landor would have appreciated this strong Warwickshire flavor; for he was Warwickshire born and bred. Walter Savage Landor was the eldest son of the head of an old Staffordshire family, who, leaving his property in that county, had settled down to the practice of medicine in Warwick. His mother was one of four coheiresses of an ancient Warwickshire family, the Savages of Tachbrook, a pleasant country village equidistant some three miles from Warwick and Leamington. From his father he inherited the Staffordshire property. From his mother he not only inherited the Tachbrook estate, but that of Ipsley on the borders of Worcestershire, as well as a share of the reversionary interest in Hughenden Manor in Buckinghamshire, better known of late as the home of Lord Beaconsfield. His boyhood was entirely passed in his native county. He was first sent to school at the cruelly early age of four at Knowle, some ten miles from Warwick. Six years later he went to Rugby, while his holidays were spent at the two country houses on the Savage estates, or in the panelled red-brick house at Warwick.

Remarkably gifted, well born, well bred, handsome, healthy, and heir to considerable property, no life could promise better for happiness and success than that of young Walter, whose genius and whose charm exercised a powerful fascination on those who knew him. But all was marred by the ungovernable violence, the incurable unreason of his temperament, which burst forth at times, bringing him into collision with his father, with his masters, with Welsh stewards, with Italian police, with English publishers, with Austrian governors—at home and abroad, in public and in private, all through his long and tempestuous career. The story of his life is about as sad as any the history of letters can show. But all this is only too well known. We in Warwickshire have but to do with the sunnier side of his nature, for some of the happiest days in his stormy later life were those of the annual visit of a month or six weeks that he paid his sister, who lived on in the old Warwick house; and those who saw him on these occasions delight in telling of his kindliness, his courtliness, his affection. All through his years of wandering and exile he turned with a deep and abiding love to his old homes, to "the mulberries, cedars, and fig trees of the Warwick garden; the nut-walk and apricots of Tachbrook." The mulberry tree still lives. But the old red-brick house is now turned into a large public school for girls, and the stately garden where Landor and his sisters picked up mulberries—the garden he would fain have reproduced in Boccaccio's Valley at "aerial Fiesole"—is now a playground for the daughters of Warwick tradesmen and Warwickshire farmers. But the nut-walk at Tachbrook is kept by loving hands just as it was in the days when "Uncle Walter" wandered up and down it on his visits to his brother Henry, the happy possessor of the delicious seventeenth-century house of many gables nestling among the huge elm trees.

A worthy son of the county "that so great spirits has bred," the first English book that Landor bought with his own money at school was Drayton's 'Polyolbion.' One of his first schoolboy poems, written among the peppermint on the bank of the square pool at Rugby, was upon a Warwickshire subject, "Leofric and Godiva," which appeared years after as one of the most perfect of his dramatic dialogues. And his close acquaintance with the neighborhood of his native place, as well as his intense love for Shakspere, induced him to undertake that weighty composition which occupied him during a great part of his life in the Villa Gherardesca at Fiesole—'The Examination of William Shakspeare.' Some years before the work in its present form was actually begun, he wrote to Southey that "he was trembling at his own audacity in venturing to bring Shakspere upon the scene." But what was Landor if not audacious? It must, however, be confessed that, apart from its interest to those who know the accuracy of every local allusion—the red tiles of Snitterfield, the rich, damp meads of Alveston, and so forth—the volume does not compare favorably with the exquisite 'Pericles and Aspasia' that followed it. It is his longest and most sustained attempt at humorous writing; and, as Mr. Lowell remarks in his delightful and discriminating notice of Landor in the current number of the *Century*, we sometimes "cannot help feeling that his humor is horse-play," and "that he now and again misses the true mean that can be grave without heaviness and light without levity."

In Warwick Church, within whose walls lie some of those splendid patrons of letters of the time when England was a nest of singing birds—haughty Leicester, Ambrose, the "Good Earl of Warwick," Fulke Greville, whose solemn monument bears his proudest title, "the friend of Philip Sidney"—it is right that we should have a record of this later Warwickshire worthy. In these days of loose thinking and loose writing, it is good to remember that he has given us pages that will serve as models of pure English prose to all time. And Landor's bust in his native town may awaken the slumbering literary conscience in some who look upon it, and prove an incentive to graver thought, to more moderate and accurate expression, than is the fashion in our slipshod, hurried, feverish writing of the eighteen-eighties.

Massive and stately as his own massive and stately prose, his "leonine" head looks up the nave to that beautiful chancel with its almost

unique roof of double ribs above the founder's battered tomb. Not only is the bust, according to those who knew him best, an admirable likeness, but the artist, Mr. Forsyth, has given with remarkable success the courtly, dignified look of the well-bred man of the old school, the tender, humorous expression about the firm, proud mouth. As we gazed on his face we could well picture him, even in his later broken years, standing bareheaded as he helped his lady friends into their carriages, "full of beautiful, complimentary speeches, of quick and graceful retorts, of simple, old-fashioned presents and attentions." We could imagine, too, his vehement denunciations of modern manners and modern language, his humorous intolerance of slang, his unbounded wrath against such "corruptions" of classic English as "giant trees," "monster meetings," "palmy days," "pluck," "sham," "humbug," etc. He looks, as he felt himself to be, "a sentinel keeping guard over the honor and integrity of the English language." And, though traces of the passionate, ungoverned nature, of the "volcanic temperament," are not wanting, yet the impression left on one's mind by this admirable work of art is as it should be—the best of the man. Kind and tender, generous to a fault, utterly exempt from spite, meanness, or the jealousy of smaller minds, loyal in friendship, wholesome and courageous — such a man was Landor in spite of grave defects. "Caring not a straw for popularity and little more for fame," to use his own words, he went through life striving after the most severely accurate expression of the great thoughts that were in him. "I hate false words," he says, "and seek with care, difficulty, and moroseness those that fit the thing."

Landor has been and probably always will be "caviare to the general." Yet it is much to say of a man that more than twenty years after his death, more than ninety years after his first works appeared, he still holds his own —that his writings are as deeply appreciated by the few as they ever were. It is much that such a writer, such a critic, as Mr. Lowell should be able to say to-day, "He has uttered through the mask of his interlocutors . . . more wisdom on such topics of life and thought as interested or occurred to him than is to be found outside of Shakspere; and that in an English so pure, so harmonious, and so stirringly sonorous, that he might almost seem to have added new stops to the organ which Milton found sufficient for his needs."

R. G. K.

A TALK ON RELIGION WITH RENAN.

PARIS, February 4, 1888.

IT would have been not a little astonishing if, after all the noise made when from time to time a priest entered wedlock, a definitive decision of the Supreme Court recognizing the validity of such marriages caused no commotion in the public calmness. But the stir has been so well modulated that we are tempted to ask: "Where do we find ourselves? Is this placid public the same that so revolted at the *liberalism* of Père Hyacinthe?"—just as, two months ago, when the late President was dismissed without further notice than a month's wages in advance, we were questioning if this wholesome home-made recipe was compounded by the same people who had hitherto believed in no other detersive than revolutions. Decidedly we are undergoing a salubrious evolution, as was expressed by M. Renan in a nutshell when he said to Père Hyacinthe, the day after his marriage: "You will not be understood now, . . . but after your death your example will furnish the model of many romances."

M. Renan recognizes in the edict of the Court of Cassation but a step towards the era of liberty which he anticipates in religion—not that he thinks the Church is on the eve of a crisis, but that time is accomplishing its decrees. I had the good luck, for one who has questions to ask, to find the great philosopher alone in his study. The Collège de France, with its noble court-yard and grand stairways, its atmosphere laden with repose, seems to have been expressly created for the man who calls life a "promenade through reality." His study is the last of an *enfilade* of rooms on the second floor above the libraries and lecture-halls. In the midst of the simple grandeur and luxury of these apartments essentially classic, the visitor feels instinctively that the rumors of the outside world are transiently entertained there.

M. Renan has the strong features of a solid race and of a sedate thinker; his cast of countenance has often been likened to unctuous abbatial dignity. His eyes, quick and searching, close while the words come from his quiet mouth in ample sentences, with a musical completeness, divorced from passion and prejudice, that gives to the communication the charm of truth. It is difficult in that serene presence to discover a likeness to the medallion portrait sculptured some twenty-five years ago, and which, to escape being entirely defaced, had to be removed from the Museum of Narbonne. At that time there were fanatics ready to put to death the man who assumed the responsibility of retelling the precious legends, and of showing us a new portrait of the young martyr, divinely sympathetic, whose supreme love for mankind redeemed the whole world.

"Do you think that the sanction of the civil laws will encourage the Catholic priests to make a decided move towards matrimony?" was my first question.

Turning from his writing-table, heaped with documents for 'The History of Israël,' M. Renan reflectively said: "Few, very few priests will be influenced by the civil interference, for the reason that marriage means divorce from the Church. Church accepts every sacrifice, . . . gives nothing in return. No illusion is possible on the part of the priest who wishes to marry. Obedience is the essence of the hierarchy in the Catholic Church, and is more rigorously enforced than its dogmas. If there is no dogma in the Catholic Church prohibiting marriage to its priests—before Charlemagne's time some bishops were married — the law of celibacy is jealously enforced by a conventional law of obedience. Now the priest is free to marry, and society will greet him like any other citizen. But it is quite natural that his bishop, whom he has disobeyed, should take from him his post; it would be unreasonable not to expect this. If hitherto the position of the married ex-priest has been so irregular in the eyes of society, it was on account of the unsteadiness of civil justice when dealing with religious questions since the Concordat of 1801."

"But don't you think, monsieur, that the Church will eventually make a compromise, and admit of its officers becoming men of family, as we see in other creeds?"

"Doubtless we should rejoice to see such modifications, but we dare not hope for them. Dissenters will arise and repeat the example of Père Hyacinthe; it is the fate of the Church to be ruptured by schisms. But Catholicism is too old a religion to admit of changes. Père Hyacinthe annulled the great influence he might have exerted by preaching that which the French could never become reconciled to—a married priest celebrating the mass."

"This prejudice of a Catholic-born but Voltairian nation was well expressed by M. Guizot, when he wrote Dean Stanley that there were French who disbelieved in God but maintained the celibacy of priests," I said.

"Very true; but the old Catholicism is immovable, and will vary without varying. Its very inflexibility will be the cause of the diminishing of its influence. Confession, so well suited to mediæval ages, is full of dangers in modern society. However, all these changes must be wrought without violent shocks. We have but to follow the evolutions until the old prejudices wear themselves out."

"Then you are not so sanguine as the fascinating Carmelite who undertook the delicate mediation between the Church and the feverish world? Père Hyacinthe is more hopeful: he finds but three changes necessary for Catholicism to resume its triumphant and evangelic march through coming ages—not to enforce belief in the Pope's infallibility, to make confession optional, and to allow the priest to marry."

M. Renan smiled, and, lowering his voice (which for a moment lent the illusion of being in a sacristy), continued: "What is more necessary is liberty—liberty for every man to compress the juice of the religion that pleases him best, to make of it an aliment. The infinite must be free to all, that man may erect structures, ideal and chimerical, according to his heart's dictates. Each one must be allowed to indulge his own romance fashioned as it pleases him, . . . allowed to accept the meaning of God in his own way. Religion is all signification, and depends for its transformation on the degree of culture in societies where it is nourished. For the countryman it is still a necessity; he will be the last to recede from the old forms, for he will require something in its stead. Sunday seems to have been expressly invented for the purpose of social gatherings in the scattered, simple life of country folk. The provinces will for some time require the priest to serve mass and confession; it is an agreeable diversion. In large centres the higher circles make religion a less frequent topic of conversation, and it seldom furnishes the cause of controversy. . . . Catholics and Protestants may spend days together without showing a desire to proselyte. All this I consider propitious to future liberality. . . . We are fast receding from many of the false laws of society as we have done from our beliefs in the supernatural. The question of marriage is incidental. The time may come when, both in religious and civil motives, it will no longer be a stumbling-block. Love will be consecrated without that ceremony we now call marriage, and those unions will be sanctioned by society. The world is already more charitable to those who love purely and disinterestedly; and the woman who is guided by her affection finds judges more lenient than the one who has learned that youth and beauty have a value."

And thus the conversation went on. I listened not to the demolishing of worlds, but to the construction of a fair one—not a world of dreams, but a land M. Renan had visited on his journey to the Promised Land. Emanating from the judgments of M. Renan is the faith in evolution and of the world's perfection thereby. He laughingly alluded to the favorite theory that the dawn and decline of centuries mark distinctive eras in the history of nations. He thinks the division of centuries purely accidental—each might have begun in the year 50; that the influence of Voltaire and J. J.

Rousseau was momentary—they are little responsible for the present current of ideas. Time composes its epochs. Evolution will bring a satisfactory régime in politics when the hand at the helm will be firm and the agents of administration conscientious, when literature will assume a more settled condition and return to its delicacy and refinement, etc.

"One cannot leave you, monsieur, without asking, independent of Eastern languages and obscure literatures, what alphabet brought you nearest the cradle of Christianity?"

"The Germans," he said, pointing to the well-filled book-shelves. "I follow closely the current of German thought. The union of so many learned individualities composes a sum of knowledge without a parallel. The English are masters of a literature that, in poetical philosophy, has reached incomparable heights, but they are not accustomed to critical science, and have not a sufficient historic lore to handle the great problems which are to bring our religion to its starting-point. Oxford and Cambridge turn out some distinguished students, but too many of them are intended to swell the numbers of an aristocratic society living on good terms with the Church; and the clergyman's knowledge of divinity is limited. What is most necessary for him in order to hold an honorable place by the 'squire is a sufficient fear of the devil. But for the last few years the most assiduous have made little progress, and the great problem slumbers."

"And after a life well filled, the consciousness of a duty well done, what is there behind?"

"Mystery, mystery. Speculations on the ultimate end of man are too *mesquins*. . . . For my own part, I believe that he who has sought the right and truth for their own sake will not have done so with loss. . . . There may be fine surprises on the other side. . . . It is better that we should know nothing. Those who do good with a future reward in view have no more merit than the one who invests in an enterprise that promises profitable returns. A good man is not one forewarned."

LE COCQ DE LAUTREPPE.

Correspondence.

RISE AND FALL OF PRICES UNDER THE TARIFF.

To the Editor of The Nation:

SIR: The assertion of Senator Edmunds, supported in *Harper's* by specifications that show the need of extraordinary mathematical dexterity in handling them in order to reach the results there enounced, is one repeated so often and so confidently in the polemic of protection, that it has seemed worth while to compound somewhat carefully the force of the tariff with the general natural movement of prices, in order to ascertain the general direction of the resultant, and to see whether the tariff really deflects that movement downward. Accordingly, I have been at pains to calculate from official data the rise and fall in foreign price of forty-seven principal classes of duty free, and ninety-six principal classes of dutiable articles during the last decade, from June 30, 1878, to June 30, 1887. As far as possible to eliminate transient irregularities, the average of the averages for the first five years has been compared in the case of each article with the average of the averages of the last five years—and with the following result:

Duty free—A total fall of 885 per cent. on 35 classes, an average fall of 25 per cent. (about); a total rise of 155 per cent. on 12 classes, an average rise of 13 per cent.; a net fall of 730 per cent. on 47 classes, an average net fall of 15.5 per cent.

Dutiable—A total fall of 1031 per cent. on 65 classes, an average fall of 16 per cent.; a total rise of 600 per cent. on 31 classes, an average rise of 19.3 per cent.; a net fall of 431 per cent. on 96 classes, an average net fall of 4.5 per cent.

Of duty-free articles the price has fallen thrice as often as it rose and twice as far; of dutiable articles the price has fallen a little more than twice as often as it rose, but only a little more than four-fifths as far. In both cases there has been on the general average a fall; but the rate of fall has been nearly three and a half times as great in case of duty-free as in case of dutiable articles. Since the line of price slopes downward three times as fast in case of duty-free articles, the force of the tariff must have been an upward thrust, and equal on the average to a rise of about 11 per cent. per lustrum, over 2 per cent. per year.

That such a result might have been expected is not, indeed, hard to show, but does not fall within the scope of this communication.

Yours, W. B. SMITH.

UNIVERSITY OF MISSOURI,
COLUMBIA, MO., February 11, 1888.

MR. EDMUNDS AS A LOGICIAN.

To the Editor of The Nation:

SIR: Is not Senator Edmunds's article on the tariff in the February *Harper* somewhat contradictory? The different parts do not fit well together.

The argument seems to be that a high tariff protects American industries by keeping up prices, because, if we lower the tariff—prices will fall? Not a bit of it; but because they will be materially as high as ever! And then the Senator gives prices and makes statements to prove this assertion in the case of certain articles. This truly curious result he attributes to the tax being paid principally by the foreign producer and not by the domestic consumer, and concludes that most probably the United States customs duties on other commodities are derived from a similar source.

"But," says the Senator, "it by no means follows from these instances that a general reduction or abolition of duties upon articles competing with those produced in the United States would not be followed by a fall of prices." It seems more logical to say that if the price of a certain article is independent of the duty *because* the duty is paid by the producer, then the prices of other articles, the duties on which are paid by the producer, would also be independent of the duty.

H. F. REID.

CLEVELAND, O., February 16, 1888.

THE TARIFF AND THE AMERICAN COLONY IN EUROPE.

To the Editor of The Nation:

SIR: Anybody with a little leisure to look about him in Europe is apt to be struck with the fact that there are permanently settled here too many Americans who are badly needed at home—men of leisure and capacity to help on education, the administration of charity, and the improvement of politics. In the older countries, a wealthy aristocracy supplies such men, and such functions are regarded as their natural duty, though, like any other duty, it is often neglected.

Now, is it simply run away from by the Americans alluded to, or are they forced away? Many of them are. Their absence is one of the results of our high tariff. It makes the cost of living in America twice as high as in many attractive places abroad, and many men of fixed incomes that would, under a reasonable system, give them leisure to attend to this important class of duties, are now forced either to sacrifice it at home or enjoy it abroad.

They are of the very class, however, which the man who depends on politics for a living most hates and dreads; so to the many blessings already attributed to the tariff must be added the "protection" of "the boys" against "the gentleman in politics."

Your obedient servant, H. H.

HANOVER, GERMANY, January 26, 1888.

OUR ODIOUS BOOK TARIFF.

To the Editor of The Nation:

SIR: Desiring to obtain a particular book recently, I found it necessary to order it from a London agency. The book was not the latest three-volume novel nor one that Mr. Mudie purchases by the hundreds. In fact, the book was first published a century and a quarter before George the Third "refused his assent to laws the most wholesome for the public good." When the book arrived at the post-office of the town where I live, I was compelled to pay customs dues; and after they were paid, I computed the per cent. and found it to be somewhat more than 27 per cent. upon *first cost, commission, and postage.* These customs dues I found were for the protection of American authors. Failing to see wherein any American author or publisher could possibly be protected, I turned to Johnson's Dictionary to find a possible meaning of the word "protection" that would cover this case. In this I failed, but I found the following, which satisfies all the requirements of the case:

"EXCISE—*A hateful tax levied upon commodities, and adjudged not by the common judges of property, but by wretches hired by those to whom excise is paid.*"

In conclusion, I will say that the book is not printed upon parchment. Y.

A PARALLEL.

To the Editor of The Nation:

SIR: One who remembers the pro-slavery newspaper literature of thirty years ago and reads the protectionist journals of to-day, will note a striking likeness—the same vocabulary, style, spirit, and method. Transpose the words "abolitionist" and "free-trader," and either would serve very well in the other's place.

Both deprecate and dread all questions of absolute right and wrong, and, instead, challenge attention to so-called facts relative to the condition of the laborer under their respective systems, compared to that of the "white slaves" or "pauper laborers" of Europe. The slavery advocate had one more string to his bow—an argument relative to Christianizing the heathen—and could quote from Scripture that the Lord gave Abraham "many servants and much cattle"; but whoever quoted "Thou shalt not steal," and made the application, condemning the appropriation of the products of another's labor, was called a "theorist," a "doctrinaire," precisely as in the protectionist literature of to-day.

The slave-owner took from the slave whatever his labor produced in excess of a bare subsistence. The protectionist compels the freedman to contribute a portion of his earnings to fill the purses of the Ohio wool-grower, the Syracuse salt-miner, and all the various manufacturers who have so hedged him in with tariffs, combinations, and trusts that he cannot

run away from the involuntary servitude. The hoe in his hand, the steel rail on which his cotton starts for Liverpool, are these new task-masters' means of extortion. Lately they have granted him free-trade quinine, with a fall in price from $6 per ounce to $1—an inconsistency, unless with a view of keeping him longer in the world for more extended protection. His former master was liberal with medicine.

In some of its aspects, the philanthropy of the advocates of slavery was broader than that of the protectionists. They were willing to Christianize, in their way, all of Africa, while the protectionist abhors to help the pauper labor of Europe, so long as it remains in Europe, and is beginning to obstruct its coming here. Its coming "under contract" is prohibited. Political economy teaches that this apotheosis of national selfishness is not political wisdom even in a mere economic point of view. But there are some plain people who believe in economic science and also in a higher law; who hold that every man has a natural right to the free use of the products of his labor, either to consume or to exchange wherever he can get the most value, without hindrance from any, whether their claim be founded upon a slave deed or its in some measure equivalent—a "protective" law. Such persons are "doctrinaires," "abolitionists," "free-traders." A. J. Coe.

Meriden, Conn., February 17, 1888.

THE LARD BILL.

To the Editor of The Nation:

Sir: The editorial note in the last issue of the *Nation* with regard to the Lard Bill now before Congress is a sound statement of the impolicy of the legislation desired. Bills of this character are unconstitutional and absurd. That Congress has no police power, except such as is necessary to enforce or facilitate the collection of revenue, has been repeatedly declared by the United States Supreme Court (New York vs, Miln, 11 Pet. 102; License Cases, 5 How. 504; Passenger Cases, 7 How. 284; License Tax Cases, 5 Wall. 462; Petroleum Case, 9 Wall. 41; Slaughter-House Case, 16 Wall. 36).

It is absurd to contend that such bills are not police regulations. Their purpose, history, provisions, and operation preclude the possibility of an honest doubt on the subject. They are designed to prevent fraud, not to collect revenue. The Oleomargarine Bill, although entitled, "An Act defining butter, and imposing, etc., a tax upon oleomargarine," was referred to the Agricultural Committee, whereas a revenue bill is referred to the Committee on Ways and Means. It provides that a stamp shall be affixed to all packages containing oleomargarine, which is not a revenue stamp, but a warning to the purchaser that the contents are oleomargarine. Its operation is to prevent deception.

All this is proper enough, if enacted by a State, whose duty it is to guard against fraud; but the general Government has nothing to do with police regulations of this character, and it is in the highest degree dangerous to the autonomy and responsibility of the States to suffer such legislation to pass uncriticised.

Yours truly, J. H. L.

St. Louis, February 13, 1888.

BYRON EXPLAINED BY SCHILLER.

To the Editor of The Nation:

Sir: In the noble bit of prose, "On the Use of the Chorus in Tragedy," prefaced to Schiller's "Braut von Messina," the author makes brief but pregnant reference to the deficiencies of a certain order of poets, which may well supplement your recent article on Byron, and may further aid your readers in accounting for his waning reputation. The author, after emphasizing the truth that ideality and reality are properly united in the great poet, who gives his readers no dreamy fancies, however novel or entertaining, but the actual wisdom of the world, separated from its oppressive commonplace, and after despatching with little ceremony "him whom nature has indeed endowed with true sensibility and depth of feeling, but to whom it has denied creative imagination," adds the following, which scarcely a decade later found striking exemplification in Byron:

"Wem hingegen zwar eine rege Phantasie, aber ohne Gemüth und Character, zu Theil geworden, der wird sich um keine Wahrheit bekümmern, sondern mit dem Weltstoff nur spielen, nur durch phantastische und bizarre Combinationen zu überraschen suchen; und wie sein ganzes Thun nur Schaum und Schein ist, so wird er zwar für den Augenblick unterhalten, aber im Gemüth Nichts erbauen und begründen."

Repeated perusal of these lines of Schiller only strengthens my admiration of the profound insight which is the essence of prophecy, and I find in them the most forcible explanation yet presented to me of Byron's transient popularity—his sensational appeals to the fancy, his disregard of all artistic and moral law, his contemptuous mockery of the wisest and most sacred wisdom of the past.—Very truly yours,

Jos. I. Helfman.

Detroit, Mich., February 6, 1888.

Notes.

A parallel series to the "American Commonwealths" is announced by D. Lothrop Co., Boston, under the editorial conduct of Mr. Elbridge S. Brooks, who will himself contribute the 'Story of New York.' The other States as yet assigned seem to have fallen into apt hands—Massachusetts to the Rev. E. E. Hale, California to Noah Brooks, Missouri to Mrs. Frémont, Virginia to Marion Harland, etc. A picturesque and popular style is aimed at.

'Famous American Statesmen,' by Mrs. Sarah K. Bolton, and a 'Life of Lafayette,' for the young, by Mrs. Lydia Hoyt Farmer, are in the press of T. Y. Crowell & Co.

Thomas Whittaker has in preparation "The Contemporary Pulpit Library," a series of sermons by the foremost preachers of the time, Canon Liddon leading off.

Cassell & Co. announce 'John Bull, jr.,' by Max O'Rell, and 'A Pocket Dictionary of Etiquette.'

G. W. Dillingham will bring out an English version of Renan's 'Abbess of Jouarre,' and a dinner receipt-book called 'Savories à la Mode.'

Longmans, Green & Co. issue directly a 'Treatise on Astronomy,' by Richard A. Proctor. It will appear in twelve monthly parts, with cuts and plates.

An 'Introduction to Chemical Science,' by R. P. Williams, is announced by Ginn & Co.

The late Gen. Emory Upton left in manuscript a work on the 'Military Policy of the United States.' The fact that it was unfinished doubtless furnishes the pretext for a resolution introduced in Congress for its purchase by the Government, completion, and publication.

The second annual report of the Librarian of the Enoch Pratt Free Library, Baltimore, shows that thus far only English books have been accessible to its patrons. Some 700 German works are about to be thrown open, after cataloguing, and as many French a little later.

Prof. F. W. Putnam tells, in his late report to the Trustees of the Peabody Museum of American Archæology and Ethnology at Cambridge, of the acquisition of the great Serpent Mound, 1,400 feet long, in Adams County, Ohio, its clearing, sowing, and fencing, and otherwise being preserved while yet made attractive as a public resort.

In the annual report of Gen. Francis A. Walker, President of the Boston Institute of Technology, we read: "Our experience, at least, furnishes no support to the view that, in order to make a school popular, the requirements for admission or continuance must be placed low, or, if the theoretical standard be high, administrative concessions must be freely made to the spirit of indolence or frivolity, or to the demands of sport or of society." The elective system works well, "options which offer the largest capabilities" being generally chosen. Nearly sixty per cent. of the students come from Massachusetts, but the range is very great. The average entrance age is rising and is now eighteen and a half years. Twenty-five women attend the Institute, of whom four are college graduates.

What we recently had to say about intercollegiate athletic contests has brought us some private approbation from college officers, and we trust has evoked more than has been expressed. The general subject of athletics was being at the same time discussed in the *Cornell Era* by the officers of that institution, by request of the editors—all rendering to athletics their due, some inclining to "hysterical demonstrations" on their behalf, and others, more or less guardedly, deprecating the abuse of them. Prof. B. G. Wilder anticipated us in our line of argument, though stopping short of our conclusion. He found the defence of intercollegiate contests reducible to two allegations, viz., "(1) that certain students, 'gifted with an uncontrollable exuberance of energy,' are thereby 'kept out of mischief,' and (2) that the institution is 'advertised' by its victories and even by its honorable defeats." This reasoning he very properly regards as irrelevant. Nor does he seem to favor the plea for special consideration for athletes in examinations (Gen. Walker's "administrative concessions . . . to the demands of sport"), which we find in the *Cornell Sun* of January 9. The *Sun* is naïvely distressed by "the damper on athletics in the shape of dropping athletes." "How," it asks, "can an average student get along in this University if he devotes three or four hours a day in careful training?"

In default of any news in regard to Cornell's share in future college tournaments, we are glad to announce that the University has appointed, as her representatives at the approaching celebration of the University of Bologna, Prof. T. F. Crane of the Faculty, and Mr. Eugene Schuyler, formerly a lecturer before the University.

The double number of the *Library Journal* for September-October, 1887, contains in full the proceedings at the Thousand Islands Conference last summer. It furnishes most stimulating reading, and impresses one anew with a sense of the wide-awake, active spirit which animates the members of the American Library Association. Practical information drawn from experience abounds in the papers read and in the discussions they excited. The value of some of the hints is inestimable—to small libraries in particular. Several leading houses

have provided for this issue lists of works by American authors published by them.

Shakespeariana for February opens with a satisfactory summary account of "Shakspere Music," mention being made especially of the operatic renderings of the several plays. A list of "societies known to be engaged in reading Shakspere" is given on p. 88. One of these meets "in a log cabin in the woods of southern Minnesota, on cold stormy nights in winter, after the ranch work is done." The list is universal as regards locality. It numbers upwards of 110. Philadelphia seems to be the chief seat of the cult—or it may have been more thoroughly reported.

Library Bulletin, No. 8, of the University of California (Supplement to the Report of the Secretary of the Board of Regents) lies before us, a pamphlet of 68 pages, with the title, 'References for Students of Miracles, Plays, and Mysteries,' by Francis H. Stoddard, A.M. The University is to be congratulated upon having so enterprising a laborer on its staff of instructors. The work is excellently done. The first section is taken up with titles of works upon this section of the drama; the second section with editions of plays not English (notably, of course, Latin Liturgical and French); the third section with the religious drama in England. At the end, a large folding sheet gives a conspectus of the contents of all extant English mystery plays. In twelve vertical columns the plays are arranged by sets or groups, from Towneley to Norwich; in forty-eight horizontal lines the contents, from Creation to Judgment. Every possessor of this pamphlet will deem himself lucky. It would be difficult to devise a more helpful guide to the practical study of a vast and intricate subject.

The Astor Library, during the year 1887, as we learn from the annual report of the Trustees, acquired 1,096 books by purchase and 1,379 by gift.

No. 27 of the Bibliographical Contributions of the Library of Harvard University consists of an ingenious reconstruction of a missing book of records, by means of an index and marginal references left by President Wadsworth, by Mr. Andrew McFarland Davis; and of catalogues of the books given to the Library by John Harvard, Peter Bulkley, Sir Kenelme Digby, and Gov. Bellingham. President Dunster, who wrote the Harvard catalogue, at first spelt the donor's name as Hervertus, changing it to Harvardus. The collection embraced almost no works except in Latin or English.

In the latest *Bollettino* of the Biblioteca Nazionale Centrale of Florence, we find mention of the impending publication of C. C. Jewett's Rules for cataloguing ("questo classico Codice") in the *Biblioteca di Bibliografia e Paleografia.*

Students of the Italian invasion of eastern Africa will be profited by Pippo Vigoni's article on "Massaua e il Nord dell' Abissinia" in the fourth supplement to the Milan *Perseveranza* (*Rivista Scientifico-Letteraria*). It is accompanied by a much needed map. The *Illustrazione Italiana*, by the way, is now publishing numerous photographic engravings of views in the forsaken region about Massowah.

A welcome addition to South American cartography accompanies Dr. Wilhelm Sievers's report on the Sierra Nevada de Santa Marta and the conjoined Sierra de Perijá in No. 133-134 of the Journal of the Berlin Geographical Society (D. Reimer). The mountainous region described lies in the extreme northern portion of Colombia, in the State of Magdalena, bordering on Venezuela. The map is on a scale of 1 : 500,000. The expedition was made at the charge of the Society in 1886. The Sierra Nevada is one of the oldest formations of the earth's surface; the Sierra de Perijá much more recent, and an evident member of the Andean system, being a continuation of the eastern cordillera of Colombia. The Sierra Nevada, on the other hand, Dr. Sievers is at present disposed to connect with a mountain chain protracted easterly through the Goajira peninsula and the adjacent islands of Aruba, Curaçao, and Bon-Air, and so on to the Lesser Antilles.

M. Henri Gaidoz, at the opening of the fourth volume of *Mélusine*, pays such a tribute to M. Eugène Rolland (who now withdraws from the collaboration of this folk-lore journal) as any scholar should be proud to receive. M. Rolland's worth, modesty, thoroughness, originality, and fecundity of production are set forth in the most becoming and genial manner conceivable.

The name of the new *Directeur* of the *Revue Bleue*, M. Alfred Rambaud, appears at the head of the number for February 4. A note from the Administrative Board informs its readers that M. Eugène Yung himself, just before his death, selected M. Rambaud for his successor, and that they only confirmed this choice at their meeting of January 25, when they elected him unanimously. M. Rambaud is the well-known writer and professor of modern and contemporary history in the Paris Faculty of Letters. When Jules Ferry became Minister of Public Instruction, he chose M. Rambaud for his *chef de cabinet.* The latter has written the most concise and satisfactory history of the French Revolution for popular use that exists, and a valuable 'Histoire de la Civilisation Française,' of which the second volume, from the Fronde to the Revolution, was published last year, and of which the third, 'Histoire de la Civilisation Contemporaine en France,' is announced for immediate publication. This is his most important work, but he has written much besides in various reviews and elsewhere, principally historical and critical articles, having some connection with France in the early part of the present century. Some of the most interesting of these relate to Russia, which he has visited, and of which he has written a short history, spoken of as excellent. He has even contributed to the *Revue Bleue* (under a pseudonym, as the note which announces his election informs its readers), some of the short stories which occasionally appear in its pages.

Two volumes of the 'Mémoires d'un Royaliste,' by the Comte de Falloux, have just been issued by Perrin (Boston: Schoenhof). It is from the portion of the Mémoires contained in these volumes that the *Correspondant* has been publishing very abundant and interesting fragments during the past year, of which the latest belong to the period of the *Coup d'État.* Faithful Royalist and Legitimist as the Comte de Falloux was, his political revelations have been by no means satisfactory in all cases to other faithful Royalists; but they throw much light upon the past and present dissensions in the party, and especially upon the conduct of its political and religious leaders during a most interesting and little understood period of French history.

We cannot recall a "first number" in any periodical venture which more nearly satisfies the ideal than does the *Technology Architectural Review*, nominally issued on November 15, 1887, by the architectural department of the Massachusetts Institute of Technology. "It is essentially a folio of plates, and not of text matter," and reproduces the "mentioned" designs or *projets* made at the Institute, with occasional departure from this limit, as in the present number, where will be found a quarter-scale drawing, by Emmanuel Brune, of the highest technical excellence, after remains of classic architecture at Cori. The very creditable school designs relate to a casino and a fountain for a public park. The execution of these heliotype plates, as of the letter-press, is admirable.

—The fifth volume of Mr. John Bigelow's edition of Franklin's Works (G. P. Putnam's Sons) covers the most of four years, 1772-1775, during which time Franklin was in London as the agent of the colonies—of Massachusetts in particular. He became convinced in his own mind that revolution and separation were inevitable, but he spared no pains by direct representations to the Government and its supporters, and by satirical articles and pamphlets, to expose the situation so that the blame should fall where it belonged. It was during this period that the Boston tea party occurred, followed by the Port Bill. Franklin transmitted to the Bay authorities the Hutchinson letters which were placed in his hands. He landed in America just after the battle of Lexington and before Bunker's Hill. The volume concludes with a draught of Articles of Confederation from his hand. Of peculiar interest is the encounter with Lord Hillsborough over the question of encouraging the settlement of the Ohio valley—a matter which fills nearly one-seventh of the book. The British political economy of that day regarded any development of the interior of this continent as certain to diminish British trade, by raising up a population beyond the reach of commerce. Franklin's successful refutation of this nonsense is still profitable reading. The doctrine of the present day, that American prosperity will be undermined by free exchange with Great Britain, exhibits as wise a jealousy of the seaboard as Hillsborough's argument "to prevent manufactures" did of the interior. Among the scientific topics touched on in Franklin's letters are spots on the sun and the stilling of waves by oil—the last being discussed at some length with evidence from personal experiment and from hearsay. He tells of oil coming to the surface and burning on the surface of some New Jersey rivers, and this is worth remembering now that petroleum is alleged to have been found by boring in Ocean County. He objects to the prevalent hypotheses in regard to the causes of taking cold, at some length and with much sense. The letter of September 30, 1774, introduces to Richard Bache Mr. Thomas Paine, who is "very well recommended to me as an ingenious, worthy young man," who "goes to Pennsylvania with a view of settling there," and would like "employment as a clerk, or assistant tutor in a school, or assistant surveyor," being capable of all, as Franklin thinks. Here, also, is that famous letter (July 5, 1775) to Mr. Strahan, M.P., King's printer, London, ending: "You are now my enemy, and I am, Yours, B. Franklin." That proverbial expression of our civil war, "Wayward sisters, depart in peace," is anticipated by the Dean of Gloucester's appeal to the Government to "let the wayward sisters—the colonies—go" (p. 286).

—Mr. Leonard A. Jones has laid the public, and especially lawyers and legal students, under a debt of gratitude for his admirable 'Index to Legal Periodical Literature' (Boston: Charles C. Soule). It will be an invaluable help, unlocking as it does the treasures, heretofore so largely hidden, of all "the legal journals of America, England, Scotland, Ireland, and the English colonies," as well as

"such articles in the principal literary reviews and magazines of these countries as seemed to belong properly to legal literature," and the proceedings of bar associations, social-science associations, and the Statistical Society. Of the author's really immense labor in preparing this book one gets a livelier idea when he reads that "all the reports of the American courts, some three thousand volumes, have been examined volume by volume, in order to make references to the proceedings in court and eulogies upon the occasion of the decease of eminent judges and lawyers." The book is a handsome quarto (pp. xix, 635), and is printed and bound in very attractive style. Some errors are probably inseparable from such a portentous undertaking as this; one such we notice in setting down "G. S. Hall" as a legal author, and attributing to him a learned, witty, and widely reprinted essay upon "Seals," written by Mr. G. S. Hale of Boston. But such a book as this should not be left with fault-finding as the last word; rather with the most hearty thanks to both author and publisher for so great a help to legal studies—thanks in behalf of all English-speaking lawyers for what will be no less useful in England and its dependencies than here.

—Teachers of Chaucer will gladly welcome Henry Sweet's 'Second Middle English Primer: Extracts from Chaucer, with Grammar and Glossary' (Oxford: Clarendon Press; New York: Macmillan). Within the limits of 120 pages the editor has given, we do not say all that one should know of Chaucer's language and versification, but all that one should attempt to teach to an ordinary class. Indeed, the passed Chaucerian will find himself enlightened by the little primer at more than one point. The grammar is meagre, but perhaps ample enough for its purpose. In parenthesis, will Sweet never give up his *Fall-Shake-Bind* conjugation? One might almost fancy that the editor of the Oldest English Texts had never heard of Paul, Braune, and Sievers. Chaucerian pronunciation has been treated at length and with exceeding care. The 'Complaint to Pity' and the first 117 lines of the 'Prologue' have even been transliterated into the editor's phonetic notation. We might take exception to certain views of pronunciation here laid down, but we cannot enter into matters of detail. In the selection of pieces, Sweet has been governed by the principle of avoiding conflict with Skeat's Chaucer volume in the series. That has not prevented him from giving 714 lines of the 'Prologue.' But who could undertake to teach Chaucer from any point of view without giving the 'Prologue'? We commend the primer most warmly.

—The interest in the 'Teaching of the Twelve Apostles,' which has never abated since the publication of the famous Bryennios MS. in 1883, will be still further enhanced by the facsimile edition, just published by the Johns Hopkins University under the editorship of Professor J. Rendel Harris, whose eminent fitness for the work has been shown by his various studies in the 'Didaché.' Of the admirable manner in which Professor Harris has discharged his editorial office some notice may be expected hereafter; but without any disparagement of the importance of the editor's work, the student's eye will first be attracted by the superb facsimile of the MS., and his first thought will be one of admiration of the Cambridge (Eng.) University Press—not unmixed, perhaps, with regret that the honor of this part also is not America's. But while the mechanical execution is indeed worthy of all praise, those who know the inside history of the quest of the Bryennios MS. will not stop here, for these ten plates represent protracted effort, patient waiting, and happy concurrence.

—The East does not yield its manuscript treasures so readily as once it did. The mere mention of the Codex Sinaiticus is enough to fire the heart of the Oriental monk; and when we reflect that the patriarchate which formerly held the Codex Alexandrinus was not rich enough to buy the facsimile when it appeared, and only received it as a present a few months ago, through the intervention of an American scholar and divine, we may begin to understand why the permission to photograph such a MS. as the 'Didaché' could not be procured without resort to diplomacy, and that, when procured, the permission was not immediately followed by performance. However, the Johns Hopkins University was fortunate in its ambassador, Dr. C. R. Hale, who brought to bear not only a fraternal interest in the Greek Church, but a contagious warmth of human sympathy which overcame any prejudices that may have lingered in the minds of the Archimandrite and Patriarch. First came the photographs of three pages of the MS., then a long pause. The MS. was transferred from Constantinople to Jerusalem, and with the transfer the whole matter seemed to have fallen into abeyance. The clerical intermediary was no longer on the ground, and there was no response to the tokens of respect and regard which the American university had sent to his Blessedness the Patriarch of Jerusalem. But the Patriarch of Jerusalem had not forgotten his promise to Dr. Hale; and what the American churchman had initiated was happily completed by the mediation of the secular arm, and the American consul, Mr. Gillman, had the pleasure of transmitting to the university at Baltimore the much coveted photographs, which are so admirably reproduced in this memorable volume. One of the most important lessons of this whole transaction—protracted as it was through more than three years—is the proof that under all the forms and phrase-makings of Oriental life there is to be found a genuine response to true kindness, just as in the wonderful flourishes of Oriental calligraphy we make out name after name to which the Western as well as the Eastern Christian owes reverence and love.

—While it is not held, even in divinity schools, that the moral teaching of clergymen is *invariably* sound, it is taken for granted, even by laymen, that moral questions appear to them through a clearer medium—that to them the ethical light is less refracted, so to speak, by "practical considerations," than it is to ordinary persons. The only (so far as we know) clerical opponents of international copyright are Dr. E. E. Hale, and the Rev. Olney I. Darling; the latter's views we find expressed in the *Universalist Quarterly* for January. Mr. Darling believes that the authority competent to decide on the value of an author's labor is not himself, but his readers—not the producer, but the consumer. Every writer, he says, has the benefit of a local monopoly, and this is not only all he ought to have, but it is sufficient (combined with other, non-pecuniary rewards) to produce all the literature that is needed. On the other hand, the thousand-to-one proportion of the public, who write no books, ought not to have their mental food artificially made dearer. The argument that protection against unremunerated, alias "pauper," labor is needed by native authors is the only one which Mr. Darling thinks it worth while to combat, and we may add that it is the only one which seems to obtain any attention from the politicians, who, though very unwillingly, admit that brain-workers cannot logically be excluded from the benefits of "the American system."

—We are surprised, however, that none of them have advocated the bounty plan, which would be much more democratic and "American" than international copyright, both because the foreigner would get no benefit from it, and because its rewards would be more generally distributed. An aristocratic form of the bounty system exists in Norway, where certain authors, in compensation for losses attributable to the want of international copyright, receive from the national treasury a fixed annual sum. This, of course, would never do here, because it sets up a foreign standard of merit, inasmuch as only those authors whose books have been reprinted abroad can claim such compensation. Now the American system cares nothing about such persons as are unpatriotic enough to have commercial dealings with Europe, but it may be supposed, figuratively speaking, to have at heart the interests of native authors, citizenship being taken as the sole test of merit. To one Holmes, or Parkman, or Howells, there would be hundreds of Texas historians, and Michigan poets, and *Ledger* novelists, if the Government would pay on each copy sold a bounty equal, let us say, to the proposed bounty on sugar. Besides, this plan would reduce the surplus without reducing the tariff, and would offer an encouragement to education, especially in those States where, owing to the lack of it, authors are scarce. Senators Blair and Platt and Sherman are, we believe, themselves authors, so we confidently commend our plan to their careful consideration.

—The opening article in the *Contemporary Review* for February is a singularly clear and convincing exposition of the relative conditions of "Islam and Christianity in India." It is unsigned, but the author is evidently a person who has a thorough knowledge of his subject, gained not from books, but from personal observation and study of the Indian character. Starting with the statement that every fifth Indian is a Mohammedan, he asserts that 90 per cent. of these fifty millions are Indians by blood and Mohammedans either by birth or by conviction. The apostles of Islam came preaching "the haughtiest, the most clear-cutting, and the least elevated form of monotheism ever taught in this world" to a people hopelessly bewildered amid a chaos of faiths. That the laxity of sexual ethics in the new faith was no source of attraction is shown by the multitude of Hindu women who accept of it, though each thereby "loses her hope of heaven and the security of her position on earth both together." Considering all the advantages which the Mussulman missionaries have, especially in being Asiatics, the slowness of their progress, barely fifty thousand converts in a year, is difficult to account for. The chief obstacles are the dogged resistance of the priesthood, and the saturation of the Hindu mind with Pantheism. While it is doubtful whether the Mohammedans are better men than the Hindus, still the writer believes that in time they will hold the reins, being "all potential soldiers, all capable of self-sacrifice for the faith," and all obedient to one central authority. How they have impressed themselves upon India as the ruling caste is shown by the fact that, in the Mutiny, "Brahmin Sepoys murdered Christian officers in the name of a Mohammedan Prince." Christianity, on the other hand, "though it has taken but a poor grip

on Hindu India," has not failed. It simply has not made the progress which might have been expected from the amount of work done. It is a fallacy to think that it is detested as the faith of the conquerors. The real obstacles are that the Hindu can be intellectually convinced of the truth of Christianity and remain unchanged; in other words, he becomes "a convert but not a Christian." The methods of the Christian missionary are imperfect and "slightly absurd"; he is setting before himself a false end, "the Europeanization of Asiatics." The result is that the "missionary becomes an excellent pastor or an efficient schoolmaster, instead of a proselytizer, and that his converts or their children, or the thousands of pagan lads he teaches, become in exact proportion to his success a hybrid caste, not quite European, not quite Indian, with the originality killed out of them, with self-reliance weakened, with all mental aspiration wrenched violently in a direction which is not their own." "Mohammedan proselytism succeeds in India," this writer concludes, "because it leaves its converts Asiatics still; Christian proselytism fails in India because it strives to make of its converts English middle-class men."

—A Western Shaksperian writes us:

"History repeats itself, otherwise the Shaksperian delineations would be for a day and not for all time. The feelers of a politician, and his involuntary indications of chagrin when he finds his feelers disappoint him, must have a family likeness in all ages. The manipulations of Cæsar when Mark Antony thrice did offer him a kingly crown, are told to the life by the great dramatist. But the Shaksperian picture is a presentment which befits Cæsar no better than Blaine, who, while lingering amid Cæsar's relics, seems to have been moved to mimic his manœuvres. 'Cæsar,' says Casca, 'put the offered crown by him with the *back* of his hand; he put it by thrice, every time gentler than other; he put it by, but for all that he would fain have had it; he put it by, but to my thinking he was very loth to lay his fingers off it,' etc. May our plumed knight follow further his Roman original who, 'when he perceived the common herd was glad he refused the crown, and shouted at every putting-by, fell down, foamed at the mouth, and was speechless.'"

—The keen competition of the conversation dictionaries in Germany has developed a new feature, almost irresistible, in the case of the seventh edition of 'Pierer's Konversations-Lexikon' (Stuttgart: W. Spemann). Prof. Joseph Kürschner, to whose inventiveness we owe already, among other useful publications, the 'Deutscher Litteratur-Kalender,' has induced the publisher of Pierer to graft upon it twelve dictionaries in the following manner. Every German word not a proper name met with in the general alphabet in the two broad columns of each page has affixed to it equivalents in Latin, Greek, Bohemian, Danish, Dutch, English, French, Hungarian, Italian, Russian, Spanish, and Swedish. But this is not all. A narrow column on the outer margin carries these same languages (save the Greek) in one alphabet, and interpreted back into German, so that the circle is complete. The convenience of this arrangement speaks for itself, and the economy of it, seeing that the language dictionaries are "thrown in," is equally obvious. We have here a hint for the next maker of a first-class English dictionary, whether cyclopædic or other. It need hardly be said that to accomplish so much in a dozen volumes involves a great deal of typographical compression, and the free use of small characters, so that the eye has to be cautious in reading. The print, nevertheless, is very clear, and the catchwords especially distinct. The engravings and maps and colored plates in the first number before us are of good quality, and we do not perceive any direction in which the execution has been slighted. We subscribe without hesitation to the profession stamped upon the cover—"Eines der originellsten Bücher der Welt!"

THE INVASION OF THE CRIMEA.

The Invasion of the Crimea; its origin, and an account of its progress down to the death of Lord Raglan. By A. W. Kinglake. Vol. VII. From the morrow of Inkerman to the fall of Canrobert. Vol. VIII. From the opening of Pélissier's command to the death of Lord Raglan. Edinburgh: Blackwood & Sons. (New York: Harper & Bros., in one volume, Vol. V.)

THESE two volumes complete the history of the Crimean war as far as Mr. Kinglake intends to write it. The work was undertaken in order to vindicate the memory of Lord Raglan, the British Commander-in-Chief, from the aspersions cast upon it, and Mr. Kinglake may therefore urge, with some show of reason, that the death of Lord Raglan is a proper point at which to arrest his labors. Actually, however, whatever was the prime intention, the vindication of Lord Raglan has, in the working out, become a very subordinate part of it. No one will ever consult these pages in order to find what manner of man Lord Raglan was, but because they contain a singularly thorough and painstaking account, written in the choicest English, of a very remarkable campaign. And having told so much of the story, Mr. Kinglake, it seems to us, was under a species of moral obligation to his readers to continue it to the end, for it is to the last degree improbable that any one else will have the audacity to attempt what he has left undone. But this, perhaps, is too bold an assertion. Mr. Martin Tupper did not scruple to try his hand at the finishing of Coleridge's "Christabel," and, with that fact before our eyes, it certainly is not prudent to assert that any enterprise is beyond the reach of human audacity. This, however, we may say, that Mr. Kinglake, having made it so exceedingly difficult for any one else to complete the history of the war, ought himself to have done so.

So much has happened since—so many greater wars have convulsed the face of the world—that an account of the siege of Sebastopol sounds, at first hearing, like an excursus into some region of ancient and half-forgotten times. For the historical student, however, there is this unique interest attaching to the war in the Crimea, that it marks the termination of that period of peace which set in with the final fall of Napoleon. Not that the intervening years had by any means been a period when "war nor battle's sound was heard the world around." But this war constituted the first struggle on anything approaching the colossal scale to which Europe had become accustomed in the days of the first Napoleon. In the history of Great Britain, the outbreak of this war marks the moment of a change in her foreign policy, the more important consequences of which are still below the horizon. Up to that time France had been the "natural enemy," and Russia the traditional ally, of our transatlantic kinsfolk. The Crimean war reversed the relative position of these two Powers, and since that day it has been impossible for the Russian Government to say or do anything—to send out a solitary geographer to explore some remote region of mountain or desert, or move half-a-dozen Cossack horsemen from one station to another—without being denounced by all reasonable Britons as menacing the peace and possessions of the British Empire. The incessant reiteration of these sinister predictions tends, as every one must see, to assure and hasten their fulfilment, and it is worthy of note how sedulously those Powers—Germany, Austria, and Italy—who hunger for the partition of the Ottoman Empire, seize upon every occasion to stimulate the wrath and the fears of the British people. If only Russia and Great Britain could be persuaded, on this pretence or that, to "lock horns" in a far distant Central Asian desert, the dividing out of the heritage of the Turk might be carried through with so much ease and celerity.

But to return to Mr. Kinglake's book. We do not think that he has been altogether successful in his attempt to vindicate the reputation of Lord Raglan. He has shown abundantly what, in truth, was never denied, that Lord Raglan was a chivalrous, courteous, accomplished, and experienced soldier. One who had fought by the side of Wellington from his first landing on the Portugal coast down to the crowning victory of the 18th of June, could hardly fail to be a skilful and experienced soldier; but lack of skill was never charged against Lord Raglan—lack of will, want of determination, was; and it seems to us that the facts, as stated by Mr. Kinglake himself, prove that the charge was true. Lord Raglan, it cannot be denied, was in a position of extraordinary difficulty. In the conduct of military operations on a large scale his experience was incomparably greater than that of either Canrobert or Pélissier; but the British army which he commanded was little more than a single division when contrasted with the masses of his French allies, and this disparity of numbers placed him, of necessity, in a position of less authority than the French Commander-in-Chief. Moreover, the British Ministry at home were for ever reminding him that the thing needful above all others was to work harmoniously with the French, and so preserve the *entente cordiale.* The difficulty, in fact, which he was called upon to overcome was of this kind. He was expected to command, and to seem to agree, at one and the same time. He was expected to save his colleagues from blundering, without doing injury to their sensitive self-esteem. He was to stand by his own convictions, and yet not to carry opposition so far as to diminish the cordiality of the Alliance. Perhaps the first Duke of Marlborough, who was as skilful in the management of men as in the conduct of armies, might have been sufficient for these jarring and contradictory duties. It is no great reproach to Lord Raglan to admit that he was not. Having to choose between the sacrifice of his military judgment and the possibility of a breach with the French General, he elected to sacrifice the former. Perhaps he was right, but the immediate result of this decision was the failure of the first assault upon Sebastopol, with a loss to the allies in killed and wounded of about seven thousand men.

Pélissier was at this time in command of the French Army, and it had been agreed between him and Lord Raglan that, after a preliminary bombardment of two hours, a general assault was to be made on the defences of Sebastopol by the allied armies. Had this agreement been adhered to, there is no question that Sebastopol would have fallen in the summer instead of the autumn of 1855. The defences had been assailed, for the space of eight days, with a tremendous and destructive fire from the allied batteries; and though the patient and indomitable fortitude of the Russian soldiers availed to repair in some measure during the night the damages which had been wrought in the day,

the works were on the morning of the assault so shaken and weakened that a cannonade of two hours would have sufficed to silence their fire. A few hours before daylight on the night preceding, the French commander sent word to Lord Raglan that he had changed his mind, and resolved to assault the fortress at break of day without the preliminary bombardment. Lord Raglan acquiesced in this insane change of plan without an attempt to shake the resolution of Pélissier, and the consequence was, that, except at a single point, which led to no result, the attacking columns never got near the fortifications they wished to carry. The intervening distance was swept with such a murderous fire of round shot, grape, and rifle bullets from the Russian works that the heads of the assaulting columns were literally swept away as soon as they emerged from the shelter of their trenches.

It is impossible to acquit Lord Raglan of unpardonable weakness on this occasion. His fault becomes the greater because he clearly recognized the impossibility of the enterprise under the changed conditions to which Pélissier had suddenly committed himself. The capture of the great Redan was the operation which had been intrusted to the British troops, and to do this, under those changed conditions, they had to traverse four hundred yards of open country swept along its whole extent by the fire from the Russian batteries. The undertaking was, in consequence, hopeless from the outset. If a strong assaulting column were told off for the duty, nothing was gained but the presentation of a larger mark to the fire of the enemy; if a weak column, it could make no impression upon the defences, even assuming that any portion survived to reach them. Mr. Kinglake tells the story of this abortive assault with his wonted patient labor and minuteness, but he does not seem to appreciate how heavily Lord Raglan was to blame for consenting to a sacrifice of life so large, so utterly useless.

But what was the cause of Pélissier's sudden change of purpose? Mr. Kinglake attributes it to a temporary aberration of mind, brought on by the exasperating interference in the conduct of the campaign exercised by the Emperor from his cabinet in Paris. The narrative of the part played by the Emperor during this remarkable siege constitutes the most interesting portion of Mr. Kinglake's latest volumes, and is, moreover, quite new. Even in France, except to the few directly concerned, it was not known until the fall of the Empire placed the private and confidential documents of the Imperial Government at the disposal of the Republic.

Louis Napoleon, as is notorious, was always on the lookout for occasions of electrifying the French people by great theatrical achievements like the campaign of Marengo or the victory of Austerlitz. He thought that he perceived a brilliant opportunity for a *coup* of this kind when it became apparent that the allies were not in a position to carry Sebastopol with a rush. He drew up a plan of campaign in which he, at the head of a French army, was to operate in the country to the north of Sebastopol so as to compel the surrender of the place by the defeat and destruction of the Russian field army. The plan, as Mr. Kinglake very clearly shows, was based upon a number of gross misconceptions, and was altogether impracticable. So enamoured, however, was the Emperor of his own scheme that he issued secret but peremptory orders to General Canrobert that he was on no account to press the siege, lest success in that quarter should obviate the necessity for the Emperor taking the field in person to carry out his own pet design. The French General, at the same time, was ordered to keep the imperial purposes secret from Lord Raglan, with, as Mr. Kinglake points out, this singular consequence, that almost from the morning after Inkerman until the resignation of Canrobert, the siege of Sebastopol was little else than a sham siege. The French Army was an "army in waiting." It was not intended to accomplish anything. Canrobert was not of a character sufficiently strong to set at defiance the foolish injunctions of the Emperor. He was too good and loyal a soldier not to feel deeply the humiliation of his position in consequence of them. And, as his only way of escape, he resigned the command.

Pélissier, his successor, was a soldier of a different calibre. Mr. Kinglake is singularly successful in literary portraiture; but in all his gallery there is no picture more striking than that of the fiery, passionate, resolute Frenchman who replaced Canrobert. Regardless of the Emperor and his impracticable plans, he began at once to press the siege with vigor, to narrow the circle of defences held by the enemy, to prepare for an assault upon the town in real earnest. This change of tactics could not be entered upon without vehement opposition from the Tuileries in the interests of "the plan." This opposition took the form of telegraphic messages which rained in upon the much-tormented Pélissier in a continual shower, producing such an effect upon him that for the space of eight days, and in the supreme crisis of the siege, he was not, in the judgment of Mr. Kinglake, accountable for his actions. In consenting, therefore, to an assault under the conditions imposed, at the last moment, by Pélissier, Lord Raglan was, according to this reading of the situation, sacrificing his better judgment to the caprices of a madman.

COLUMBIANA.

Christophe Colomb et Savone: Études d'histoire critique et documentaire. Genoa. 1887.

Le Quatrième Centenaire de la Découverte du Nouveau Monde: Lettre addressée à son Excellence le Ministre de l'Instruction Publique du Royaume d'Italie par un citoyen américain. Genoa. 1887.

No one has done so much to elucidate the minor points of the career of Columbus as Mr. Henry Harrisse. The two large volumes of his 'Christophe Colomb,' published three years ago, were throughout minute in investigation and careful in construction; but Harrisse, like so many enthusiasts, having got a bent, is prone to turn everything to its support, and in this way he found everywhere the evidences of the fraud which he believed to be perpetrated in the Life of Columbus usually accredited to his son Ferdinand. This failing of Harrisse is so patent that it invites conflict, and it was to be expected that an old antagonist like Henry Stevens would not remain silent. Dr. Shea, too, entered the lists in an article on "This Century's Estimate of Columbus" in the number of the *American Catholic Quarterly Review* for last July, in which he stands a champion for Ferdinand. Harrisse thinks himself conscientious, and he is an honest antagonist in so far as he does not garble or conceal. He professes that "le document est son seul guide," and he has been wonderfully successful in ferreting out such materials; but with all this he is too confident in his theories always to see evidence that tells against them.

His last criticism, however, is open to little of this objection. An old memoir about the history of Savona by Verzellino, who flourished in that Italian town at the beginning of the seventeenth century, was printed there for the first time three years ago, and imbedded in it there happened to be a document which served to reinforce effectually the arguments heretofore maintained, that the father of Christopher Columbus was a citizen of Genoa at the time of the discoverer's birth. This led Harrisse, in a paper which he published in the *Revue Historique* last autumn, to go over the whole question of the birthplace of Columbus, and this paper enlarged is now published as above. He very soon narrows down the question to Genoa and Savona, for the multitudes of towns on the Mediterranean shores claiming the honor of the nativity of Columbus is very large, and, as he tells us, the family name of Colombo is still a common one in the Italian maritime towns. It is this fact, and the eagerness to connect their history with that of the great discoverer, which has caused the Italian press almost to swarm within a few years past with local monographs in the interest of this or the other town or village. Any current Italian bibliography will show the excess of this zeal. They have added something to our general knowledge, and have been the incentive of some valuable studies. Konrad Hübler gave us, in Von Sybel's *Historische Zeitschrift*, the other day, a summary of the recent literature on the Columbus story; and another has lately begun to appear in the *Zeitschrift der Gesellschaft für Erdkunde zu Berlin*, No. 131.

Harrisse seems to think that this new document, in connection with Verzellino's memoir, with its notarial attestation that "Dominico de Collumbo" was of Genoa, settles the question, with the aid of the corroborative testimony which has been the ground of the arguments of those who contended for Genoa as the place of Columbus's birth—and it probably does.

In anticipation of the coming celebration in 1892, Mr. Harrisse has also printed the second pamphlet reported above. It is an appeal to commemorate the event by the publication of the works of Columbus, of which he says there are sixty-four separate titles known, and of these at least twenty-five are preserved in his own autograph—namely, nineteen in the collection of his descendant, the Duke of Veragua at Madrid; two in the Spanish archives; three in the palais Tursi at Genoa; one in the library of the Lieutenant-General, the Marquis de San Roman; and the rest in the library left by Ferdinand Columbus to the Cathedral at Seville, of which Harrisse has already given us so much information. Nearly all, he says, have been published and translated; but the texts need to be revised and annotated. He does not despair of finding yet other manuscripts of Columbus in Italy, at present unknown; and he further urges the collection and preservation in print of the numerous reports sent back to Italy by her representatives of various sorts, who, during the days of Columbus, were living in Spain, and making known by letters home the progress of maritime discoveries.

Harrisse contends, also, for a complete Columbus bibliography, and represents that there are at least six hundred titles to be gathered of books, tracts, or papers devoted exclusively to the study of Columbus and his career. He would further add a summary of the cartography, with facsimiles of all the cardinal charts illustrative of the train of discoveries which Columbus instituted, beginning with that of Juan de la Cosa in 1500, and ending with those of Schouten and Baffin in 1616, when the contour of the American Continent was first in the main determined. Those interested

in the rather curious and now extended list of pictures supposed to be portraits of Columbus, will be struck by the judgment of Harrisse that not a single authentic likeness of Columbus can be supposed to exist. We are interested to observe that among the notes of this last tract Harrisse announces that he has in press in New York a brochure to be called 'A Spurious Autograph-Letter of Christopher Columbus: Facts, Documents, and Facsimiles,' which we understand to be a letter addressed to Mr. Samuel L. M. Barlow of this city, whose attention had been called to a letter which was proved, under Harrisse's scrutiny, to be a forgery.

The Mammoth and the Flood. An Attempt to Confront the Theory of Uniformity with the Facts of Recent Geology. By Henry H. Howorth, M.P., etc., etc. London: Sampson Low & Co. 8vo, pp. 464 and xxxii. 1887.

In the first words of his preface Mr. Howorth states, "The title of this work reads like a challenge, and it is meant to be a challenge. For many years past, geological reasoning has been vitiated by being tied to metaphysical premises. It is time that some one trained in scientific methods, but untrammelled by having his will prejudiced, should speak out unflinchingly against the condition of things which has been most mischievous, and has very greatly impeded the development of a most important science." The rest of his preface, and indeed the whole of his work, is an elaboration of the thesis that the scientific world is out of joint, at least so far as geology is concerned, and that it is his peculiar mission to set it right. The principal wrong which he finds in geology is, that it assumes as a general principle, that the processes which have gone on in the earth since the introduction of organic life, have been of the same general nature as those which are now operating upon it. It cost the men who have made the science of the earth what it is, centuries of devoted labor to get clear of the early notion, which was to the effect that the earth's past had been a period of numerous cataclysms, widespread accidents of a physical sort, differing totally in their nature from anything which passes before our eyes in the present geological day. Our author bids us abandon this result of long labor and follow his lead in returning to the ancient doctrine.

Mr. Howorth finds his principal thesis in the circumstances attending the disappearance of the hairy mammoth from the northern hemisphere, holding that this disappearance, together with the preservation of very numerous bodies of this creature, as well as of the contemporaneous woolly rhinoceros, can only be explained on the hypothesis that the destruction was due to a sudden catastrophe, which he thinks involved a widespread flood of water. In selecting this interesting series of facts for the principal basis of his conclusion, our author shows a clever sense as to the most pregnable point in the doctrine of uniformity. In the very extended search which he has made into general literature, as well as that of a strictly geological sort, he exhibits, what few speculators of his class do, a painstaking in research which is altogether admirable. He has not always known where to look, and he betrays a novice's lack of critical ability in perceiving the difference in the measure of authority to be attached to the diverse statements he has encountered; nevertheless, the book will long remain valuable to the geologist for the very numerous and interesting records and traditions gathered from various works which are not likely to meet the eyes of scientific men.

As nearly as it is possible to determine from the text of our author, his idea is, that the mammoths of Siberia and Europe lived in those countries at a time when the climate was decidedly warmer than at present, and when the forest trees ranged up to the border of the Arctic Ocean. Suddenly there came a great flood which destroyed these creatures, and was followed by a period of intense cold, during which the mud produced during the deluge, together with the remains of the beasts, was converted into ice. In favor of this view he notes the vast numbers of the remains, and the presumption that they must have been frozen as soon as they were overwhelmed by the deluge. If the author had approached his subject in a critical way, to found a valid hypothesis rather than to support a conjecture, he would have perceived that the very facts which he adduces in proof of his notion militate strongly against it. He should have seen, in the first place, that these mammoths, as well as their companions the woolly rhinoceroses, were evidently the tenants of a cold climate, for the reason that they had a more ample covering of hair than any other creatures known to naturalists. They were even better protected against cold than the polar bear himself. There is thus no reason to suppose that any great modification of temperature is indicated by the existence of these creatures in the high north. Probably the northern limit of trees has been forced somewhat south of that which it occupied while these animals dwelt in Siberia; but this modification was not necessarily one that brought about any very sudden or great change in temperature. An alteration of 5° in the mean annual temperature would produce a great change in the northern limit of all our forests.

Mr. Howorth next urges that the vast numbers of these fossil creatures is evidence of their sudden destruction by a flood. This argument proves too much. The Siberian soil doubtless contains the frost-embalmed bodies of hundreds of thousands if not millions of the mammoth; but that all these creatures lived at once in the ancient forests of Siberia transcends belief. The evidence goes to show that in that Arctic land are the remains of more elephants in a wonderful state of preservation than have existed at any one time on the continent of Asia, and that the process of accumulation was slow and long-continued.

Again, the author urges that the curious accumulation of mammalian bones which we find at many points in Europe and North America—heaps in which occur the remains of a dozen or more species and perhaps a hundred individuals—can only be explained by supposing that the creatures took refuge from the invading waters on some height of land where they were finally overwhelmed. A little practical knowledge of these deposits would have shown him the untenable nature of this argument. In the first place, these "caches" of mammalian bones, as he terms them, are not found on hilltops, but in valleys; and those who have attentively studied them find a very simple explanation of their occurrence. The creatures were doubtless mired in bogs to which they resorted for water in times of drought, or to which they were tempted by the luxuriant vegetation developed in such places. In certain cases, as at Big Bone Lick in Kentucky, where salt springs escape from the earth and form small marshes, the saline waters were a bait which led them to destruction. In time the cutting down of the streams which drain the bog, combined perhaps with a desiccation of climate, converts the morass into dry land. In the case of the Siberian mammoths, we have the simple explanation, long since adduced, that the great rivers of that area have their headwaters in the south and the lower portions of their streams in high latitudes; that they lie in a position which causes their headwaters to break up before their lower channels have escaped from the frozen state. The result is that their floods are very severe, and are likely to sweep away into the frozen north the bodies of many animals which make their winter habitations along the banks. In the time of the mammoth the Arctic Ocean doubtless covered a good deal of Siberia, forming a vast extent of shallow waters. The interglacial and post-glacial time was probably a period of more rainfall than at present, and the rivers more efficient in this destructive work than they are at present. Discharged into the cold waters of the Arctic sea, these flood-swept bodies would decay but slowly, and thus would have the chance to be locked in the frost before the flesh had been removed from the bones.

The next point taken up by Mr. Howorth is the evidence afforded by the caverns of Europe which contain large quantities of mammalian remains. He endeavors to show that these remains were conveyed into the caverns by a great flood, and were buried immediately beneath the mud produced by the widespread cataclysm. Here, again, the lack of personal field knowledge, which so often invalidates the work of geological speculators, hampers his acute reasoning. There is no question that many of these caverns afford evidence of floods, but we are without proof that the floods occurring in separate caverns were synchronous. The present writer has investigated, in a more or less careful way, some hundreds of caverns in this country and in Europe, and has often found evidence of similar floods in the facts which they afford. A little study of caverns will show any discreet observer that all the lower chambers of our caves are liable to sudden access of water, owing to the various accidents which from time to time block the ways of the subterranean streams. At such times a vast deal of clayey matter previously imported into the cavern is shaken about and lodged in new positions.

The difficulty arising from the lack of an extended field of knowledge exhibited in these cases renders this very extended, and in many respects admirable, piece of work quite unavailing for the end it has in view. There can be no doubt that the hypothesis of uniformity of geological action has been carried rather too far, but to endeavor to substitute such clumsy hypotheses as that of continental floods is to run against a body of evidence of an overwhelming nature which contra-indicates such catastrophes, since the close of the glacial period or at any other time in the earth's history. The attitude of our drift, especially the delicate forms of the kames, affords overwhelming proof that no such flood has taken place in northern Europe or America since the last ice time. A proper revision of the hypothesis of uniformity is one of the largest and most important pieces of work now awaiting the devotion of such a life as that which Sir Charles Lyell gave to the establishment of the doctrine. To this task the student must bring a critical ability and an unwearable patience such as were the peculiar possession of that great master.

Mr. Howorth's book is written in a vivid and charming style. It displays an admirable devotion of a literary sort to his task, and will doubtless attract much popular interest to the great question in which it deals. The book is well printed, but it has no index, the most unpardonable fault in bookmaking.

Essays on Some of the Modern Guides of English Thought in Matters of Faith. By Richard Holt Hutton. Macmillan & Co. 1887.

THERE is nothing in this volume which appeared in the first edition of Mr. Hutton's literary essays except a considerable portion of the fourth article, "George Eliot as an Author." That portion will be found intact in the volume of 'Essays in Literary Criticism' published here in America in 1876 by Porter & Coates of Philadelphia. The essay in the present volume differs from that only in the addition of matter relating to "Middlemarch," which had not appeared when the essay was first published. In the Porter & Coates volume there was an essay on Matthew Arnold, but it dealt exclusively with his poetry, whereas the essay in the present volume deals more largely with his prose than with his poetry. The earlier essay is by no means superseded by the later. The two are necessary for a complete understanding of Mr. Hutton's view of Arnold, a view which all those who care for Arnold would do well to reckon with. Those whose liking for him is extravagant might find here something of correction; those who are indifferent to him might be led to question whether they are wise in being so. The essays are especially deserving of attention from those who imagine that Mr. Arnold's strength is in his prose rather than in his poetry, and that his prospect of survival inheres more in the former than the latter. Our own persuasion has long been quite the reverse, and Mr. Hutton's essays are confirmatory of this feeling. That part of the present essay which deals with Mr. Arnold's poetry is more penetrating and suggestive than the former essay. What is most individual in Mr. Hutton's essay is his dissidence from the average opinion that Arnold is a pessimistic poet. Accounting him the best of all our elegiac poets, he finds in his elegies a note of buoyancy, and this same note he discovers generally in his most melancholy poems. Though the poet and the thinker in Arnold are absolutely one in their conscious thinking, the poet in him helps him to rebel against the thinker, and to encourage us to believe that the "stream of tendency" which bears him up so bravely is not blind nor dumb. Whatever one may think of Mr. Arnold's theological opinions, if they are theological, those who are most inclined to "see things as they are" will be most pleased with Mr. Hutton's characterization of Mr. Arnold's endeavor to eviscerate the Bible and to fill the void that he has made with his own "gospel according to Matthew."

As between Mr. Arnold and Cardinal Newman, Mr. Hutton's sympathies and admirations are distinctly with and for the latter. He furnishes another example of Dr. Newman's power to impress himself favorably upon men of the most various theological opinions; and this, not merely by his style, the force and charm of which are universally admitted, but by the quality of his mind and by the intensity of his moral sentiments. He runs a very interesting parallel between the styles of the two men, and while his admiration for Mr. Arnold's style is very great, it is evident that Dr. Newman holds him by a stronger spell. The least satisfactory part of Mr. Hutton's essay on Dr. Newman is his criticism of his ecclesiastical position. For while allowing that there cannot be a church, or any witness of God, "without submission to some visible vicegerent of God," he cannot see why this vicegerent should be infallible. But he shows plainly enough, although unconsciously, why it should be, as he proceeds. The scope which he allows to reason is wholly inconsistent with anything like "submission" to a visible representative of God.

The essay on Carlyle makes clear how much more effective for the expression of his thought the developed style of the man was than his earlier—that of 'John Sterling,' for example, in comparison with the 'Life of Schiller.' There is a good analysis of Carlyle's influence upon English politics. In three out of five political crises Mr. Hutton judges that the influence of Carlyle was distinctly bad—namely, our own civil war, Gov. Eyre's suppression of "revolt" in Jamaica, and the attack of Prussia and Austria upon Denmark. The others were the Franco-Prussian war and the Communistic outbreak in Paris. The German sympathies of Carlyle were, to Mr. Hutton's thinking, helpful in the former case, though with some unfairness; and his sympathy with order helped to clearness in men's view of the Commune. Right or wrong, wise or unwise, one can hardly imagine a situation more to Carlyle's mind than the final suppression of the Communists by the Thiers Government. But the best influence of Carlyle on English politics has been less direct, his critic thinks, than in these instances. It has been through his arraignment of an idle aristocracy. His 'French Revolution' is set down as the book by which he will be chiefly remembered—"the most unique book of the century." A telling note is made of Carlyle's contempt of everybody not of his own clan. We read in Emerson's biography that "poor fellow" was his epithet for even the best of his contemporaries and friends.

Mr. Hutton is nowhere more delightful than in his essay upon "George Eliot as Author." To read this essay is to renew much of the pleasure that we had in reading the novels of George Eliot, and to attain to many points of view which, going by ourselves, we missed. Mr. Hutton's admiration for George Eliot is extremely cordial, and his feeling for the nicest shadings of her work is very keen. The bias of his theology does not prevent his being generally just. If there is an exception, it is in the extravagance of praise bestowed on Dinah Morris. We are obliged to wonder whether Mr. Hutton does not complicate his satisfaction with her evangelical piety with his delight in her as a dramatic creation. He cannot allow that George Eliot was a poet, and he has a very keen analysis of her 'Legend of Jubal' adverse to its idea of the sanctifying and ennobling influence of death apart from immortality. The intellectual background of the 'Spanish Gipsy' seems to him truly great, and the "rich color and almost Miltonic stateliness" of some of the passages that are quoted go far to convince the reader that if she was not a poet, then the genus poet has not many species or varieties. On page 236 there is a metaphor which is a surprise from one whose father was a clergyman and who was instructed for the Unitarian ministry at the feet of Martineau. He speaks of an "invisible rock higher than themselves to which [certain people] can entreat *to be lifted up.*" It is strange that he should have drawn his figure from a sensational picture, and not from the real meaning of the corresponding passage in the Psalms, where the rock is a stronghold, not a crag of the deep sea.

Besides the article on George Eliot as an author, there is one upon her 'Life and Letters.' The man who has once been a Liberal and has fallen back into the camp of the Conservatives is apt to be severe when judging those from whom he has come out. There is something very much like *odium theologicum* in the manner in which Mr. Hutton girds himself for this part of his work. It would be very hard to reconcile his praise of George Eliot's ability to enter sympathetically into the life of a Dinah Morris or a Savonarola with his insistence on the scornful levity of her dissent from the prevailing creed. His crediting of her conversion to Mr. Hennell's 'Inquiry Concerning the Origin of Christianity' is without warrant, as was shown in a letter in the *Nation*, No. 1153; and his entire argument, at this stage, is invalidated by the fact that the letter which he quotes (page 270) was written six years subsequently to the abandonment of her evangelical opinions. It is by no means likely that the mood of this letter was the mood of her conversion. In the meantime she had translated Strauss, and her taste for the felicities of criticism had been sharpened not a little. Mr. Hutton remarks the suddenness of her conversion, and at the same time expresses his astonishment that her early views were to her as a burden lifted, not as a support taken away. But does not this fact show plainly enough that there was a good deal of preparation for her conversion, more or less conscious, in her previous state of mind?

Mr. Hutton looks upon the most of her novels as "written in great measure to impress on others the depth and significance of a tie the sacredness of which her own example did much to undermine." They were a kind of expiation. In support of this view he has much to say that is, if not convincing, well worth considering. His disappointment is natural in finding so little of the vivacity and humor of her novels in her letters. It is much greater in finding that "her heart never seems to have rebelled against her own dim creed." But, then, it is very certain that she would not have accepted Mr. Hutton's statement of her creed as true to her own thought and feeling. He makes no sufficient allowance for her conviction that the laws of justice, mercy, truth, and love are in the grain of things. There is no justification for his saying that she was her own god. Surely she stood abashed and humble in the presence of a moral order which was to her of infinite depth and mystery and sacredness.

The essay upon Frederick Denison Maurice, while it is the most sympathetic in the book, exhibits frankly some of the limitations of that mystical theologian's mind. It would appear that, with the best intentions, he had great difficulty in making himself clearly understood. A character so vague and so illusive is an admirable subject for criticism of such a refined and subtile quality as Mr. Hutton's is throughout his interesting and suggestive book.

Memoir of Fleeming Jenkin. By Robert Louis Stevenson. Charles Scribner's Sons. 1887.

THIS is not so much a biography as what is known in fiction as a character-sketch. Fleeming Jenkin came of a line of rather strange people on both sides. His near ancestors and their relatives all had a story in their lives, and of these Mr. Stevenson naturally makes the most possible as a setting for the hero's birth and boyhood. Jenkin himself, at fifteen, was a spectator of the French Revolution of 1848, and wrote some letters at the time to one of his mates, which are full of the spirit of the thing. He was in Genoa in the troublous time of Novara, also, and all this tells very much under the skilful hands of his biographer. As soon as his real life began, which was that of a practical workman in applying science, particularly to marine telegraphy, the point of interest is his own energetic and self-assertive individuality, which made his mind and career both

very full. He married young, and his relations to his wife and children make the thread of the narrative, broken only by some extracts from his letters describing cable-laying in the Mediterranean, and later by his employments and amusements in Edinburgh, after he became professor there. He must have been a trying companion, because of his combativeness in talk, and lack of grace or tact, or whatever one chooses to call it, which rendered it necessary to become acquainted with his substantial worth before one could really take pleasure in him. The range of his curiosity was very great, and he had a mind active enough to bring original force to bear upon the whole of the varied matter; yet one finds here very few striking remarks or observations of any kind from his own lips. There is nothing better than his reply to Mr. Stevenson, which the latter tells against himself: "I remember taking his advice upon some point of conduct. 'Now,' he said, 'how do you suppose Christ would have advised you?' and when I had answered that he would not have counselled me anything unkind or cowardly, 'No,' he said, with one of his shrewd strokes at the weakness of his hearer, 'nor anything amusing!'"

He was much valued by his friends, and rightly. He did some excellent scientific work which will be more fitly noticed in connection with his collected papers. He was altogether an interesting character. But, for all that, he is fortunate in his biographer, and the pleasure this volume gives is very largely due to the way in which Mr. Stevenson handles his materials. On finishing the book, it is surprising how very little remains of the two hundred and fifty pages; and then one realizes that he has been reading of a number of other things besides the life of Fleeming Jenkin. Of these other things, a few incidents are charmingly related; but in the main, the power of the style lies in its happy characterization of the many persons, comparatively speaking, who enter on the scene. Alfred Austin, for example, is excellently sketched. But the most winning figure to us is that of the gentle old Captain, Fleeming's father, and the account of his death scene is something one does not find every day. "It was the proper thing for a dying man of Captain Jenkin's school of manners to make some expression of his spiritual state; nor did he neglect the observance. With his usual abruptness, 'Fleeming,' said he, 'I suppose you and I feel about all this as two Christian gentlemen should.'" Just before dying, he heard that the men of Sussex had been the first to relieve Khartum and General Gordon. "He sat up in bed and gave three cheers for the Sussex regiment." So he died at the age of eighty-four. These minor characters, which help the narrative so much, reproduce the surroundings of Jenkin's life with great vividness, and give it the right relief. Jenkin himself, who had come to be a believer in the religious view of our life in a simple fashion, by the course of his own days, died at the early age of fifty-three; and in the case of a man of such superabundant energy this circumstance makes the end seem more than usually a break and a waste. What could be done to exhibit his character in the respect in which it was held, and yet honestly, Mr. Stevenson has accomplished with gratifying success.

Ireland's Cause in England's Parliament. By Justin McCarthy, M.P., with Preface by John Boyle O'Reilly. Boston: Ticknor & Co. 1888.

THIS is a succinct and readable apologia for the Irish movement, by one who gave up much to join it, and who has partaken of all its vicissitudes. "The progress of the Irish Parliamentary Party in the English House of Commons," says the preface, "is a study for all minorities. It is a story of profound interest. . . . It promises to be the first radical national reform by legislation, without revolution, of European history." True; but the study cannot be considered complete until the aims of the party are accomplished and we see to what extent their methods affect their handiwork. Nor is it likely that all, even many who believe in the necessity and righteousness of the uprising, on the whole, take Mr. McCarthy's somewhat glorified view of its history so far. There has inevitably been much of the earth earthy about it. Movement and leader have answered to the necessities of public feeling in Ireland; and Irish public feeling has been a well-spring of bitterness and heart-burning. The loftiest sentiment, the purest devotion, have doubtless been to a considerable extent the incentives to action—the details of working have not always been as immaculate as our author would desire us to infer them to have been.

Athletics and Football. By Montague Shearman, with a contribution on Paper Chasing by W. Rye, and an introduction by Sir Richard Webster, Q. C., M. P. London: Longmans, Green & Co.; Boston: Little, Brown & Co.

THIS is the latest issue of the "Badminton Library," which is meant, as the preface states, to "form an encyclopædia to which the inexperienced man who seeks guidance in the various British sports and pastimes can turn for information." Like its predecessors, the volume contains the fulsome dedication to that "eminent sportsman H. R. H. the Prince of Wales," by the Duke of Beaufort, under whose auspices the "library" is being published, and it is in truth a compendium of most branches of athletics well and intelligently written—perhaps, indeed, from the standpoint of an enthusiast rather than that of a dispassionate student of the subject, but still with a thorough knowledge, and an interest which the reader cannot fail to share.

The first chapter, on "The History of Athletic Sports in England," traces the development of the taste for these kinds of amusement, in which the Anglo-Saxon race has always stood preëminent, from the days of Chaucer to the present time, and describes many curious means of recreation practised by the early English. As men have grown in civilization and culture, most of the roughest of the mediæval games have had applied to them certain degrees of polishing and refinement. "Bear Baiting," "Cock Throwing," and the more manly diversions of sword and cudgel-playing, are nearly extinct; the pugilist pleases the public taste by refraining from the actual encounters which, less than fifty years since, were openly conducted, and wages most of his contests in accordance with rules invented by a prominent member of the British aristocracy, and which alone have preserved his virtues from oblivion. To all sports there has been a gradual addition of the scientific element, and a tacit admission in so doing that in every one of them mind bears quite as important a place as simple physical force. The trained walker or runner of the present day is vastly superior to his predecessor of a century since, and every branch of athletics can show better performers than before intelligent experience had revealed what brains can do in directing muscle. The civilized athlete is superior to the savage one. He can walk further, run faster, hit harder, row better, and last longer at any form of exertion practised by both.

Following the chapter on the history of athletic sports are seven others, on various sports and games, the most important of which is that on "Training." This is useful reading to any man, and a capital chapter, full of good hygienic doctrine worth to anybody a dozen medical prescriptions. Chapter viii, "Athletic Government," is mainly a history of the various athletic clubs of the United Kingdom, but towards the end of it Mr. Shearman gives a few pages to the advantages of the present devotion to athletic sports, which he thinks on the whole have benefited the English character and made it stronger, manlier, and cleaner. He probably weakens his case somewhat by the statement that in any "school, college, or large body of men it will be found that the dozen best cricketers, footballers, or oarsmen will provide more clever scholars than any average dozen of the others." Certainly, in our American colleges, celebrity in athletic directions has not generally gone hand in hand with fine scholarship, though not inconsistent with it. Nobody can object to, and few fail to commend, the closing paragraph of this chapter:

"When going into training means nothing more than living a healthy regular life, and the daily exercise is taken to increase the strength and skill, and not to see how much the human body can do without failing, then no one, except from his own fault, can suffer any harm from athletic sports."

The next third of the book treats of football, tracing its origin and history from the mists of antiquity. The game has been, in various forms, played in England for six centuries, and is the most essentially popular sport of the country. In the days of Edward II., that monarch issued a proclamation forbidding the game as leading to a breach of the peace. Richard II., Henry IV., James III., and other kings, including Henry VIII., in turn enacted statutes against the game, which, as Mr. Shearman says, "has from the earliest days been an obstreperous member of the family of British sports, and, indeed, almost an habitual criminal." The statutory repression of the game did not, however, avail in the face of its popularity, and our ancestors went on maiming and killing each other in its pursuit, with rare interference by the sympathizing enforcers of the laws. One Carew, who wrote in 1602, says:

"I cannot well resolve whether I should the more commend this game for its manhood and exercise, or condemn it for the boisterousness and harm which it begetteth; for as on the one side it makes their bodies strong, hard, and nimble, and puts a courage into their hearts to meet an enemy in the face, so on the other part it is accompanied by many dangers, some of which do even fall to the players' share, for the proof whereof, when the hurling is ended, you shall see them returning home as from a pitched battle, with bloody pates, bones broken, and out of joint, and such bruises as serve to shorten their days, yet all is good play, and never attorney or coroner troubled for the matter."

It is very hard to believe that Mr. Carew had never seen our intercollegiate football games, which of late seem only to have differed from those he describes in not being "good play," *i. e.*, without resulting hard feeling. Perhaps it is the reversion in our civilized youth to the practices of early barbarians which is building up the deplorably hostile feeling that exists between two of our prominent colleges since their annual maulings over a football have begun. The third college member of the trinity, if it may be so called, owes to its present inferiority in this and other athletic sports the fact of its not being publicly detested, though perhaps privately derided, by the other two. For it is

an every-day observation that any young man attending one of the rival colleges is held by those who perhaps were the friends and schoolmates of his youth, but who now live at the other institution, to be unworthy of respect and lacking in all manly qualities.

A chapter on "Paper Chasing and Cross-Country Running" finishes the book, which is well illustrated with instantaneous photographs and woodcuts. Exceptions may be taken to a few of Mr. Shearman's statements. For instance, page 73, he says, speaking of a "sprinter": "Whether his legs be short or long, he has large muscular thighs and a broad back." The best of the American college sprinters are notably of slender build, and Myers himself especially so. Mr. Shearman speaks of him as being "little more than a long pair of wiry legs, with a very small and light body on top of them." Again, his description of the "Tug of War" in this country is so far from true as to be ridiculous to any one familiar with it, the game here being quite as scientific and orderly as the English one.

A Girdle Round the Earth. By D. N. Richardson. Chicago: A. C. McClurg & Co.

In its literary style and freshness of view, this volume is distinctively above the average of the annual crop of books published by tourists round the world. The "girdle," in its formidable length, does not suggest Puck's, which could be put round the planet in forty minutes. The author requires four hundred and forty-nine pages of long primer for the weaving of his story. In sprightliness and flippancy, however, and in general airiness in regard to facts possibly thought unimportant, he suggests the merry fairy whose words he uses for a title. He has arranged his letters and jottings in excellent form, with a good analytical table of contents, and dedicates them, as a book, to the wife and children to whom, presumably, they were first written, though some of them have seen print before. Four hundred days were spent on the route of forty thousand miles. The time occupied was from August, 1885, so that these lively epistles, dialogues, and note-book impressions seem as fresh, as damp, and as limp as the morning newspaper laid at one's breakfast plate. There is scarcely a dull page in the book, and the Western American's love of rapid transit in literature, as in all else, is here both illustrated in the author and furnished for the reader. The narrative moves forward in the briskest style imaginable. It reminds us of heat as a mode of motion. Everything is comprehensive, far-ranging, full of generalizing. Without room for dull accuracy in details, the mass vibrates in a whirl of sprightliness and vigor.

After two chapters on the start and the Pacific voyage, five others are given to Japan, four to China, five to the countries of Peninsular Asia, two to Bible lands, three to the countries of the Turkish Empire, three to Italy, five to other parts of Europe, and one to general reflections. The author would have done himself more justice, and spared annoyances to his readers, had he spent a few hours in a library on his return home, and corrected some of his inaccuracies and many of his curious and superficial but mistaken notions. On page 60, he would have us believe that "the nervy, rice-fed heathen" Japanese "coolies" at Yokohama (though, properly speaking, there being no caste in Japan, there are no coolies, but free laborers) beat an equal number of "vigorous Highland soldier athletes," because of their diet, instead of because of their life-long dexterity with the push cart, which is a specially balanced machine, requiring skill even more than strength, whether gained by meat or rice. The talk on page 83, that the Chinese "printed with type two thousand years ago," is rubbish, and the author's general ideas about Chinese chronology (p. 116, p. 122) are hazy and according to unrevised cyclopædias. Many of his statements of things in the Holy Land will not stand the test either of history or of the surveyors of the Palestine Exploration Fund. Many passages such as those relating to Jerusalem (p. 241–242), the Jordan (p. 257), are graphic and brilliant, but usually marred by some infelicitous remark which may please the zealots who idolize or ridicule the Bible, but will disgust those who do neither. Indeed, the chief fault of the author is his tendency to lofty and sweeping generalizations, which betray a lack of modesty such as culture alone can instil in a traveller. One is nauseated with the constant repetition in every chapter of the author's religious views, and his thrusting of theology into nearly every description given and opinion expressed. One might almost call his work 'The Sentimental Journey of a Theologian.' A little more reading and genuine culture must certainly improve an author who wields a trenchant pen with an ability not always well directed.

A History and Genealogy of the Conant Family in England and America, thirteen generations, 1520–1887. Containing also some genealogical notes on the Connet, Connett, and Connit families. By Frederick Odell Conant, M.A., of Portland, Maine. Privately printed. Portland. 1887. 8vo, pp. 641.

This genealogy is a welcome addition to the long list of family histories, since it recalls the work of one of the founders of Massachusetts, and informs us that his posterity is numerous and reputable. Roger Conant, the first Governor *in*, if not *of*, Massachusetts, was, as he stated in a document dated in 1671, born in Budleigh, a market town of Devonshire. The researches of our author show that Roger was baptized there 9 April, 1592, being the youngest of the eight children of Richard and Agnes (Clarke) Conant. The pedigree begins with John Conant of East Budleigh, born about 1520, probably at Gittisham, who was the father of Richard and grandfather of Roger. The third son of Richard was Rev. John Conant, a strong Puritan, who died in 1646, rector of St. Thomas à Becket, Salisbury. The fourth son, Christopher, was a grocer of London, came to Plymouth in 1623, and was at Salem in 1630, when he disappears.

In the next generation, Roger Conant had several nephews, all clergymen, viz.: Richard, vicar of East Budleigh; John, vice-chancellor of Oxford; Samuel, Malachi, and John. One branch, indeed, is traced herein to the present generation, and doubtless other branches in England could be found. In 1813 one of these descendants of Richard C. of Budleigh, viz., Sir Nathaniel Conant of London, applied for a confirmation of arms, alleging that his ancestors had used a shield of "Gules, ten billets *or*," and had granted a shield "per saltire gules and azure, billetty, *or*," which variation may denote some doubts in the mind of Garter King of Arms.

Roger Conant, who was doubtless free of the Salters' Company of London, married at St. Ann's, Blackfriars, London, November 11, 1618, Sarah Horton. He came with his wife and child to Plymouth in 1623, there joined Lyford at Nantasket, and in 1625 was chosen by the Dorchester Company as Governor of their settlement at Cape Ann. In 1626 he removed and planted Salem, and in 1629 his settlement was absorbed into the Massachusetts Colony. Here he lived until his death, November 19, 1679, always respected and useful, but without the prominence one would naturally expect to find accorded to him.

He had sons, Caleb, Lot, Roger, Joshua, and Exercise, and the name has been continued through Lot and Exercise. The record here given is very thorough and exact, and enrolls the names of many Conants who have been honored and valuable citizens. It is both a surprise and a satisfaction to find that such a sturdy Puritan family has continued to thrive and increase, preserving an historic name and doing credit to its ancestry.

Legends of the Shawangunk. By Philip H. Smith. Pawling, N. Y.: Smith & Co. 1887.

This is a medley of "historical sketches, biographical notices, and thrilling border incidents and adventures relating to those portions of the counties of Orange, Ulster, and Sullivan, lying in the Shawangunk region," put together almost without plan or relation of parts. The author says: "While there is much that is here found in print for the first time, all available published sources have been laid under contribution in its compilation." As he affords no marks by which his readers may distinguish between original and conveyed matter, it is impossible to say what proportion of the work is due to his "rigid search" of "ancient records"; much of the quoted matter, however, is from local publications now long out of print, and therefore is as good as new. But unfortunately the book contains little of value, either new or old. The beautiful Shawangunk (Shon-gum) region (curiously described as "a vast amphitheatre of rocks") deserves something better than this string of detached anecdotes, containing here and there interesting bits of history, but without reference to a single authority, so far as we have observed. We note the author's remark, that "it may interest the reader to trace the transition from primitive 'Duck Cedar' into classic 'Tuxedo,' but he does not endeavor to trace it.

Mr. Smith's volume is illustrated by woodcuts such as are familiar on railway time-tables and county maps, and others from "pen sketches by the author"—the latter being of such simplicity as are seldom seen in form more permanent than a child's drawing on his slate.

BOOKS OF THE WEEK.

Ames, Julia A. Platform Voices: Temperance Recitations. Chicago: Woman's Temperance Publication Association. 25 cents.
An Unlaid Ghost: A Novel. D. Appleton & Co. 50 cents.
Barrows, Rev. W. The United States of Yesterday and of To-morrow. Boston: Roberts Bros. $1.25.
Beatty-Kingston, W. Monarchs I Have Met. Harper & Bros. 50 cents.
Brydges, H. Uncle Sam at Home. Henry Holt & Co. $1.25.
Caine, H. The Deemster: A Novel. D. Appleton & Co. 50 cents.
Cameron, G. F. Lyrics on Freedom, Love, and Death. Boston: Alexander Moore.
Cust, Lady. The Invalid's Own Book. W. S. Gottsberger.
Dawson, Sir J. W. The Geological History of Plants. D. Appleton & Co. $1.75.
Denison, T. S. The Man Behind. Chicago. $1.50.
Gallaudet, E. M. Life of Thomas Hopkins Gallaudet. Henry Holt & Co. $1.75.
Green, S. Home Fishing and Home Waters. O. Judd Co.
Gunter, A. C. Mr. Potter of Texas: A Novel. New York: Home Publishing Co.
Hand Book of Rio de Janeiro. Rio de Janeiro: A. J. Lamoureux & Co.
Harris, Prof. J. R. The Teaching of the Apostles. Baltimore: Publication Agency Johns Hopkins University.
Hellwald, F. von. Die menschliche Familie. Part I. Leipzig: E. Günther.
Hopkins, Mark, jr. The World's Verdict: A Novel. Boston: Ticknor & Co. $1.50.
Kinglake, A. W. The Invasion of the Crimea. Vol. V. Harper & Bros.
Long, J. H. Slips of Tongue and Pen. D. Appleton & Co. 60 cents.
Marshall, Emma. On the Banks of the Ouse. E. P. Dutton & Co. $1.25.

Newman, Prof. F. W. Kabail Vocabulary. London: Trübner & Co.
Peabody, Rev. A. P. Harvard Reminiscences. Boston: Ticknor & Co. $1.25.
Remmer, H. Russland und die Europäische Lage. Leipzig: W. Friedrich.
Sanders, D. Das hohe Lied Salomonis. Hamburg: J. F. Richter.
Starrett, L. F. Poems and Translations. Boston.
Sterne, S. Beyond the Shadow, and Other Poems. Boston: Houghton, Mifflin & Co. $1.
The Art of Investing. D. Appleton & Co. 75 cents.
The Original Mr. Jacobs. The Minerva Publishing Co.
The Story of Jewad. W. S. Gottsberger.
Tolstoi, Count L. N. Napoleon and the Russian Campaign. Thomas Y. Crowell & Co. $1.
Tolstoi, Count L. N. The Long Exile, and Other Stories for Children. Thomas Y. Crowell & Co. $1.25.
Young, G. A. Whatever Is, Was. Leggat Brothers.
Weld, M. C. A B C of Agriculture. O. Judd Co.
What Shall We Do with It [The Surplus]? By President Cleveland, J. G. Blaine, H. Watterson, G. F. Edmunds. Harper & Bros. 25 cents.
Whipple E. P. Outlooks on Society, Literature, and Politics. Boston: Ticknor & Co. $1.50.
Willson, T. E. It is the Law: a Story of Marriage and Divorce. Belford, Clarke & Co. $1.
Wilson, R. B. Life and Love: Poems. Cassell & Co. $1.50.
Wood, Rev. J. G. Fourth Natural History Reader. Boston School Supply Co.
Woodward, F. C. English in the Schools. Boston: D. C. Heath & Co.
Works of William Shakspeare. Reduced Facsimile from the First Folio Edition of 1623. Funk & Wagnalls. $2.
Yale, Catherine B. Story of the Old Willard House of Deerfield, Mass. Boston: Houghton, Mifflin & Co. $2.00.
Yonge, Rev. J. E. An Exposition of the Apostles' Creed. Thomas Whittaker. 75 cents.

Fine Arts.

PICTURES AT THE WATER-COLOR EXHIBITION.

If we consider light and air to be the principal qualities which a landscape should possess to be good, we shall not find any better at the Water-Color Exhibition than those painted by Mr. Charles A. Platt. "Lifting Fog — Dordrecht," No. 213, while it is a scene in Holland, is by no means painted with an eye to the sort of effect we find in many contemporary water-colors which have Dutch motives for their subjects. While these are toned down to blackish gray, and houses and boats, trees and figures, are half lost in a woolly sort of blur, Mr. Platt's picture is frankly laid in with clean, crisp washes, and is fresh and transparent in color. There is a strange idea which has always existed among writers on Dutch art, that the climate of Holland must be dark, misty, and gloomy. Taine speaks of the "coaly sky" of Amsterdam, and Charles Blanc of the "veiled sky of the Netherlands." Many painters have imbibed this prejudice and have painted pictures of Dutch subjects accordingly. M. Henry Havard, in a recently published volume, has devoted considerable space to this matter, and says rightly that Holland is one of the most luminous countries in the world. He shows that its sky, charged with vapors, reflects light with surprising intensity, and colors in themselves having no value have effect and brilliancy given them by the contrast which they form with their immediate neighbors, as well as the proportion of light and shade which enter into their composition. That Mr. Platt has seen Holland with unprejudiced eyes, and has painted his pictures as he saw the country—light and enveloped in a luminous atmosphere—is to his credit as an artist, for there is no lack of precedent for painting the blackish fog in everything in any way connected with Holland. In another picture, "Return of Sardine Boats from a Morning's Catch," No. 307, we find the same direct manner of painting and the same charm of luminous atmosphere.

A painter whose methods in treating figure subjects resemble those employed by Mr. Platt in landscape is Mr. Irving R. Wiles. There is no work in the exhibition that shows a more complete mastery of the medium than is evinced in the half-dozen pictures by which Mr. Wiles is represented. They are marked by simplicity and directness in obtaining effects, and these qualities are shown notably in a small picture of a young woman in modern dress seated on a park bench, "In the Park," No. 405, and in "Alone," No. 344, a much larger work, in which the black and gray tones of the dress are cleverly managed. In other works—"Waiting," No. 339, "A Study in Tints," No. 232, and "The Coquette," No. 150—there is freshness of color and sound painting.

Most original of all the painters represented in the Water-Color Exhibition, not so much in mere choice of subject as in his manner of presenting it artistically, is Mr. Winslow Homer. There is nothing particularly novel about a pumpkin patch, nor anything out of the common in a man's gathering the ripe pumpkins, yet Mr. Homer, in his "'For to be a Farmer's Boy,'" No. 360, has made of these elements a picture which is intensely individual. The figure of the young man with the pumpkin, and the long green vine still hanging to it in his arms, is relieved against the autumn sky, and there is a stretch of country and a low horizon dimly indicated in the distance. The color is strong and the drawing robust and spirited, but it is the feeling of the country, of the breezy outdoor life of the farmer, of "the smell of the earth and the song of the birds," with which the artist has invested his subject, that forms its charm. There are several other pictures by Mr. Homer in the exhibition, but none of them equals this, and there is but one to be compared with it. "Sand and Sky," No. 500, however, is a picture which does not possess the poetry of the other, but is simply an effective study of a white, sandy beach, with two figures of fisher girls and a black, stormy sky. It is remarkable for its virility of style.

It is always cause for satisfaction, if prizes are to be given in an exhibition, to find such prizes awarded to pictures which are entirely worthy. The Water-Color Society has been endowed this year with two valuable prizes, one for a figure work, the other for a landscape or marine picture, and they have been given to Mr. Alden Weir and Mr. Horatio Walker. Mr. Weir's "Preparing for Christmas," No. 273, a picture of a lady in black and a child in white at her side arranging Christmas greens, has excellent technical qualities and is a serious and dignified work. The successor of other pictures similar in subject and in treatment which have been shown at previous exhibitions, it is better than any of them, and conclusively proves Mr. Weir's right to be ranked among the best water-color painters we have. Mr. Walker's picture, "Evening," No. 331, a quiet landscape of flat meadows and some thinly foliaged trees with a herd of swine moving slowly across the field in the foreground, recalls the modern Dutch school in the way the landscape is treated, and in the drove of pigs there is a suggestion of the homely picturesqueness of Millet's work. This picture is noticeable for its excellence as a piece of color and for its completeness and harmony of composition. If we could find faults in it, they would be comparatively unimportant faults of detail, such as the unnatural shape of some of the saplings whose thin trunks are seen against the sky in the middle distance; but the great excellence of the picture as a whole make such small matters of little moment. It is singularly free from technical faults, and devoid of any semblance of trickiness in painting, and to say this of a contemporary water-color painting is to say a great deal. We shall not find many more in the exhibition of which this can be truthfully asserted.

Mr. Robert Blum, one of our best-known and most talented painters in water-colors, is represented here by an excellent picture, "A Venetian Pumpkin Vendor," No. 120; Mr. Lippincott by four works, of which the best are "Sylvie," No. 49, a nearly half life-size figure of a young woman, which is painted in a light color scheme of whites and blues, and "Stolen Moments," No. 61, another young woman seated in a chair with her back to the window, reading a book—a picture painted in the highest of high keys and of an extreme lightness of general tone; Mr. Dielman by a dignified study of a lady in black with some white chrysanthemums in her lap—"In October," No. 5; and Mr. Tiffany by a number of works of various subjects, quite the most remarkable being a decorative figure composition of much brilliancy of color, "Feeding the Flamingoes," No. 439. Mr. Ranger's mature talent is well exemplified by various works. In "The Village of Pont St. Maxence," No. 7, "A Wet Day in Amsterdam," No. 167, and "Sunset and Snow, Madison Square, N. Y.," No. 325, we find his usual excellent qualities of color and justness of observation in painting street scenes, and in "Clouds," No. 310, and "Morning on the River Oise," No. 388, effective painting of pure landscape. Two charming bits of sky and water, most artistic in treatment, are Mr. Twachtman's "Boats on the Maas," No. 545, and "Landscape," No. 555, and an agreeably colored and neatly painted picture of a marine subject is Mr. Carlton T. Chapman's "The Lighthouse," No. 90. Mr. Percy Moran is seen at his best in a delightful little picture of a young lady of colonial times, dressed in blue, lighting the candles on a table—"Tea Time," No. 37; and "Autumn," No. 31, is the title of another charming trifle by the same painter, in which the subject is a simple figure of a pretty girl standing in a doorway. "The Washing Ground of Madrid," No. 199, by Harry Fenn, is one of the cleverest of sketches, a small bit of paper with innumerable figures of washerwomen at a river's side and lines of white linen blown by the wind, the whole deftly indicated and sparkling with little spots of gay color. In contrast to it is "Primavera," No. 244, by Theodore Robinson, a quietly painted head of a peasant girl, in which the charm lies in subtle drawing, in delicate, almost faded, tints, and in the tenderest painting.

HAVE JUST READY:

I.

THE STORY OF CREATION.

A plain account of Evolution. By EDWARD CLODD, Author of 'The Childhood of the World,' etc. With 77 wood-cuts and diagrams. Crown 8vo. Cloth, $1.75.

"The object of this book is to present, in as clear and compendious a form as the important nature of the subject permits, an account of the origin and development of the universe, with its totality of living and not-living contents. There is no lack of popular expositions of that part of the theory of evolution which explains the origin of life forms, but the present work is believed to be the first attempt of the kind to deal with the larger questions of cosmic development in a language as free from technical terms as seems possible."

II.

OUR SENTIMENTAL JOURNEY THROUGH FRANCE AND ITALY.

By JOSEPH and ELIZABETH ROBINS PENNELL, Authors of 'A Canterbury Pilgrimage,' etc., etc. With map and 124 illustrations by JOSEPH PENNELL. Crown 8vo. Cloth, $1.75.

III.

Reissue of the Greville Memoirs in Eight Monthly Volumes.

A JOURNAL OF THE REIGNS OF KING GEORGE IV. AND KING WILLIAM IV.

By the late CHARLES C. F. GREVILLE, Esq., Clerk of the Council to those Sovereigns. Edited by Henry Reeve, C.B., D.C.L. (3 vols.) Vols. I. and II. Crown 8vo, each $2.00.

IV.

Two New Books by Mrs. De Salis.

OYSTERS A LA MODE.

Or, The Oyster and Over 100 Ways of Cooking It. By Mrs. DE SALIS. 12mo. 60 cents.

SOUPS AND DRESSED FISH A LA MODE.

By Mrs. DE SALIS. 12mo. 60 cents.

BIOGRAPHIES OF WORDS AND THE HOME OF THE ARYAS.

By F. MAX MÜLLER. Crown 8vo, cloth, $2.00.

PAPERS, LITERARY, SCIENTIFIC, ETC.

By the late FLEEMING JENKIN, F.R.S., LL.D., Professor of Engineering in the University of Edinburgh. Edited by Sidney Colvin, M.A., and J. A. Ewing, F.R.S., with a memoir by ROBERT LOUIS STEVENSON. In two volumes, with portraits and diagrams. 8vo, cloth, $10.50.

ASTRONOMY FOR AMATEURS.

A Practical Manual of Telescopic Research in all Latitudes adapted to the Powers of Moderate Instruments. Edited by J. A. Westwood Oliver. With illustrations. Crown 8vo, cloth, $2.25.

THE ENGLISH HISTORICAL REVIEW.

Edited by the Rev. MANDELL CREIGHTON, M.A., LL.D.

No. 9, JANUARY, royal 8vo, price $1.50.

CONTENTS.

NOTICE.

The FIRST EDITIONS of Dr. Cunningham Geikie's great work, 'The Holy Land and the Bible,' have been already exhausted in London and New York, and a SECOND EDITION is now ready.

In Two Volumes, with Map, price $5.00.

THE HOLY LAND AND THE BIBLE.

BY THE

Rev. CUNNINGHAM GEIKIE, D.D.

Author of 'The Life and Words of Christ,' etc. In a lengthy review of this work the London *Times* of January 4, 1888, says:

"In estimating Dr. Cunningham Geikie's important work, it must be remembered that it is REALLY ENCYCLOPÆDICAL IN CHARACTER AND AN ILLUSTRATIVE BIBLICAL COMMENTARY, rather than a mere book of travel. Comprehensive in every sense, it is a formidable undertaking to read it at a stretch, giving it the attention it deserves. Everywhere it is replete with information and illustrations. Each chapter concentrates a flood of light on the localities it describes."

FOR SALE BY THE PUBLISHERS.

The Nation.

NEW YORK, THURSDAY, MARCH 1, 1888.

The Week.

THE explosion of party wrath against the new Fisheries Treaty must be interpreted by what has gone before. It must be remembered that the Republicans in the Senate had voted nearly two years ago against any commission to negotiate a treaty—which was the same thing as voting against *any* treaty, even though it might result in giving us all that we claimed or asked. It will be called to mind that, after the late Commission had been appointed, Senator Frye of Maine, who is supposed to be most heavily charged with fishing interests, called in question the legality of the Commission altogether, and intimated that its work would be rejected on the ground of irregularity without regard to its merits. It must be borne in mind, also, that the opponents of any treaty have committed themselves to the policy of retaliation, and have adopted a method which reverses the national policy in that behalf, by putting upon the President the onus of retaliation instead of reserving it to Congress, where it properly belongs as an adjunct of the war-making power. In view of these facts, it is most natural that the treaty should be received with great wrath and dudgeon. As it has been proclaimed beforehand in many ways that no treaty would be satisfactory, we can hardly wonder that this one is not satisfactory. Opposition to it has been discounted in advance by all who desire to be delivered from this pest and menace. But these antecedent facts do not dispense the Republican Senators from the necessity of finding reasons for the rejection of the treaty, if they mean to reject it.

Mr. Trescott of Washington has perhaps made, in the columns of the *Herald*, the most formidable attack on the treaty which it has yet received. He says, "We paid the enormous amount of $10,000,000—$5,500,000 in cash, and the balance in twelve years' remitted duties" on Canadian fish—"for the privilege of catching $700,000 worth of fish." This means that the value to us of the fishing privileges for which we are contending, in Canadian waters, has been shown by twelve years of actual experiment to be a little over $58,000 a year. The duties we no longer remit. This appears to be, if we are to believe Mr. Trescott, and he is the most competent critic of the treaty that has yet appeared, the exact measure of our bone of contention with Canada. We want $58,000 worth of fish every year from Canadian waters. Now, the total number of persons employed in the fishing business in the New England States is about 30,000. Say that half of these want to fish in Canadian waters, and would bring home the $58,000 of fish. The share of each would be under four dollars a year. It is about this sum that the people of the United States are asked to-day to lash themselves into fury, and hurl defiance at a small neighboring people—Americans as well as ourselves, and mostly of our own faith and race. Of course it is annoying that we should have made a bad bargain under the Treaty of Washington, and paid a great deal of money for fish which we never caught, but it is childish to allow temper over that to hinder our settlement of the present dispute. Diplomatists, of all men, ought not to cry over spilled milk. The one duty of American statesmen to-day with regard to Canada is to prepare the way for her absorption into the Union with a contented mind and fraternal feeling. This is a consummation worth trying for, even if it cost us a dollar a head more for the Gloucester fishermen.

The action of the Democratic National Committee in calling the Convention to meet at St. Louis a fortnight before the Republicans meet at Chicago, shows the great advantage which the party reaps from having a leader possessed of convictions, whose record is a platform in itself. The reactionary and Bourbon elements which so long made Democratic success impossible, have been overcome by the logic of events, and Mr. Cleveland's Administration enables the party to open the canvass with confidence and courage. The selection of an early date for the Convention will strengthen the hands of the tariff reformers in Congress, and the renomination of Mr. Cleveland upon the platform laid down in his message is now seen to be assured. The Hill boom had but little vitality left before, and will not be heard of hereafter. The Brooklyn *Eagle*, which has always shown itself particularly well informed as to the Governor's course, says that Mr. Cleveland's name will be proposed to the Convention by Mr. Hill, and predicts that he will receive the vote of every delegate from every State and Territory on the first roll-call.

Mr. Blaine appears to have administered a rebuke to the "unspeakable donkeys" and "unmitigated" and "drivelling idiots" who, in the *Tribune* and elsewhere, have been insisting that his letter of withdrawal was not sincere, for in an interview with a correspondent of the *World*, cabled from Florence on Saturday, he is represented as replying with a "most emphatic negative" when he was asked if he would under any circumstances permit his name to be used again as a candidate. He then added:

> "I do not wish to make any new affirmations upon the subject. I have said all that I wish to say upon this subject in that letter. That letter, as you must know, was not a haphazard, off-hand affair. It was the result of much deliberation and careful thought. I hold that I have no right to be a candidate again. A man who has once been the candidate of his party, and defeated, owes it to his party to withdraw, and not be a candidate a second time. More than this, there is another plain reason for my withdrawing. I could not go through the burden and fatigue of another Presidential canvass—such a one as the canvass of the last campaign. To accept a nomination, and to do less than before, would be impossible. It would look as if I had no faith myself in the success of the party."

That ought to be conclusive, but the *Tribune* still throws doubt upon it by repeating its old remark that the interview "withdraws his name from the consideration of Republicans for the nomination, so far as it is in his power to do so."

We presume there are by this time very few people in the community who do not know all that is worth knowing about the "Trusts," how they are formed, how they operate, and what their object is. The time for exposure and denunciation of them therefore seems to have gone by, and the time for proposing a remedy has arrived. There is a great deal of threatening on all sides, but nobody has as yet drafted the constitutional bill which is to extirpate the evil. We hope this most necessary work will be done before long. It seems to be forgotten that our present tariff has for its object the very thing which constitutes the guilt of the Trusts, namely, the raising of prices to the community at large by restricting competition in the market. What has produced Trusts is simply the fact that the law does not restrict competition sufficiently to enable manufacturers and dealers to make as much money as they would like. They are therefore trying to supplement the law by voluntary combination. Now, we do not like this; it is very prejudicial to the public interest. But where is the high-tariff man who has the brass to propose that it should be punished criminally? If there be such a person, let us see a draft of his bill, and let us hear his address to the jury in the prosecution. If the Trust men are charged with restricting competition, they will ask, What else is the tariff for? If they are charged with raising prices to the consumer, they will ask, What else does the tariff do? They will add that high prices are necessary to enable them to pay high wages to the American laborer—that if they did not combine, they would have to go out of business; and they will ask, What is the use of the tariff except to enable people to carry on trades in which there is no profit under a system of open competition? We advise anybody who is going to meet them in court to get something ready besides denunciation of monopoly.

The strike of the locomotive engineers on the Chicago, Burlington and Quincy Railroad, which began at four o'clock on Monday morning, is a model in its way. It has been undertaken after full discussion, and after the complete failure of the negotiations, and in the manner and spirit in which two reasonable business men separate on finding themselves unable to come to terms. There is, we are told, to be no interference with the company's business, and no attempt to prevent the employment of new men on the part of the strikers. If this programme

be carried out, it will unquestionably win sympathy for the engineers among that great body of the public who know little or nothing of the merits of the quarrel. That is, people will be disposed to say that men as calm, and sober-minded, and self-respecting as these would hardly take a step so serious unless they had at least a good deal of right on their side.

We print to-day a communication of considerable interest about the attack which is being made on railroad property in Iowa. The assault is widely attributed to the instigation of friends or supporters, headed by Gov. Larrabee, of Senator Allison, who is now generally talked of as one of the possible candidates in case of Blaine's positive withdrawal next summer. If Mr. Allison's friends, however, think they are helping him by an onslaught on one of a great body of invested property, held largely in the Eastern States, they are making a prodigious mistake. No candidate who allows his name to be associated with legalized robbery of people who have saved money, and invested it in Iowa in reliance on the honesty and good sense of her Legislature and purity of her courts, need show his face in this part of the world in these times. If the Iowa politicians carry out their programme, they will put her in the category of repudiating States, in the eyes of the civilized world, just as effectually as if they refused to pay the interest on the State debt. People who have money to lend or invest will not make any distinction between cheating the State creditors and confiscating railroad property; and no convention which wants to win an election or get money for a campaign, will send a candidate into the field who has even the repute of having been mixed up in a transaction of either kind.

Among the articles in the tariff list which yield a considerable part of the hated surplus, and which most persons thought might with advantage be put on the free list, are fruit and nuts. Not so. A gathering of fruit-growers in southern California recently passed a series of resolutions against any reduction of the duties on oranges, nuts, prunes, plums, or raisins, or any other horticultural or agricultural products. It is argued by the California fruit-growers that duties on fruit create a home market for the manufacturer just as duties on manufactures create a home market for the farmer and fruit-grower. On the other hand, Mr. S. T. Coulter of Sonoma County, Cal., writing to the *Pacific Rural Press*, cries, For shame! and asks, "Why should we who boast of the wonderful productiveness of our orchards, and vineyards, and olive, and orange groves, and proclaim to the world that they yield us an annual clear profit of from *three to five hundred dollars per acre*, begrudge to the millions of hungry, starving poor who are famishing for our luscious fruits the mere pittance which the tariff adds to our enormous profit? . . . For very shame let us cease snivelling and whining for protection—let us cease to play the rôle of paupers, and proclaim our inability to support ourselves, and cease boasting of our phenomenal productions and enormous profits." The duty on plums and prunes is 1 cent per pound, on raisins 2 cents, on filberts, walnuts, and hazel nuts 3 cents, on almonds 5 cents, and on oranges 25 cents per box. Bananas are on the free list, but it is reported that a petition has been sent to Congress to impose a duty upon them, because, although they cannot be produced in this country, they take the place of a certain amount of native fruit. Poor old Uncle Sam is, indeed, having a miserable time with his surplus. Yet some of our ablest statesmen say that a surplus is an easier thing to deal with than a deficit.

The Indian Bureau appears to have made a serious blunder in its order of last year forbidding any use whatever of the Indian languages in instruction on the reservations, and to be committing a grave wrong in its refusal to rescind the order. Everybody concedes that the United States Government should employ every legitimate means to encourage the substitution of the English language for the native tongues, and a prohibition of the use of any language except English in the schools supported by the Government would be justifiable. But the Government has no moral right to go further than this, and to order peremptorily that missionary societies, which maintain schools in many places without assistance from the Federal Treasury, shall cease using the Indian languages. The trouble in the matter seems to be that the Indian Bureau attempted to bring about a desirable reform too hastily and too carelessly, and now allows a foolish pride of consistency to stand in the way of a frank confession of error. As we understand the case, the people most seriously affected fully sympathize with the purpose in view, of encouraging the substitution of English for the vernacular, and would have sustained any reasonable effort in that direction. But they feel that the Indian Office has acted hastily and treated them cavalierly, and they appeal for a reversal of its action with an argument which seems stronger than any of the attempted replies to it.

Some of the Republican organs are waving the bloody shirt over a favorable report from a committee presented in the House by a Democratic Representative from Georgia, on a bill to repeal that section of the Revised Statutes which prohibits ex-Confederates from holding commissions in the United States Army. They evidently forget that a similar bill was introduced in the last Congress by the Republican Senator from Virginia, and supported also by Republican Senators from Pennsylvania and Nevada. Consistency demands the passage of such a bill, which is only carrying out to its logical conclusion the reconstruction policy adopted by the Republican party. That policy provided that ex-Confederates might return to Congress to make laws, and might sit upon the Federal Bench to interpret laws. Of course they ought to be equally eligible to appointment in the army which may be called upon to enforce the laws. When Republican Presidents appointed "rebels" to the highest places in the civil service, they removed the last argument against their admission upon equal terms to the military service.

A Southern educator writes to us:

"Your editorial on 'Southern Homicide' was a good one, and I am heartily glad that you think that matters are mending in this respect. I have not noticed any improvement myself. I work against our Southern views as well as I can. I teach a Bible class of young men, and have given them my views of the matter very fully. One of the occasional attendants is a young fellow whose father, one of our best citizens, killed another prominent man a year ago last summer, and yesterday the wife of the slain man was there to hear my talk on Christian forgiveness. I could tell other things to show how that spirit is abroad—I mean the spirit of avenging one's own wrongs."

We fear this is hardly the most effective view to take of the matter. Preaching "Christian forgiveness" in reference to the homicidal tendency will, in the great majority of cases, confirm the notion, which is at the bottom of most Southern homicides, that wrongs calling for the infliction of death are, in a civilized community, private wrongs, the penalty for which the individual sufferer is at liberty to remit if he pleases. This, however, socially considered, is an anarchical doctrine. If a man has done something to me for which I think he ought to be slain or otherwise punished, I have no right to forgive him at all. The pardoning power does not rest with me. I have transferred it to the society in which I live. His offence is against it, and not against me only. I can neither try him, nor sentence him, nor let him off. I am bound to pursue him and see that he gets justice through due process of law, no matter how I may feel towards him as a Christian. I have no right to go after him with a knife or a pistol, except as the aid of the sheriff. Anybody who succeeds in getting these ideas implanted in the heads of Southern youth will find them more fruitful of peace and quiet, we cannot help thinking, than appeals to personal morality, because they do not permit the would-be murderer to negotiate with himself about the execution of his designs.

There was an interesting discussion in the Republican New York County Committee last week, the object of which, according to the *Tribune*, was to confine the organization to "straight Republicans only." This keynote appears to have been struck with much greater clearness by a member who declared that "there should be a straight Republican party if there was only one man in it." This sentiment evoked tremendous applause, and we are not surprised that it did. It puts into the terse language of formula the principle which has been animating the Republican party in this vicinity since the last national election. That election having shown that the party could not command votes enough

to win at the polls, its leaders at once determined upon the somewhat unusual course of reducing its numbers. It immediately began to "purge" itself of all members suspected of being in any way tainted with independence. This succeeded so well that in the election of the following year the Democratic plurality in the State was increased from 1,047 to 11,134, and in the election of last November it appeared that the good work was still going on, for the Democratic plurality advanced then to over 17,000. The Republican vote in this city has dropped in the meantime from 90,000 to 58,000. The work of making it "straight if there is only one man in it" is still going on, and anybody who has been unable to find a rational explanation of the *Tribune's* course towards the approaching Presidential campaign will find it here. The party is not working for mere success at the polls, but to make itself "select."

The Indianapolis *Journal* publishes the following editorial paragraph: "In answer to repeated inquiries, the *Journal* replies that Gen. Harrison, while a member of the United States Senate, voted for the Chinese Restriction Bill as it now appears upon the statute-book." The *Journal* appears to have been made the victim of deception. If its editor will turn to his copy of 'McPherson's Handbook of Politics for 1882,' and consult the portion devoted to "The Chinese Question" (pp. 92-107), he will find the attitude of Gen. Harrison upon this question very differently stated. The first Chinese Bill passed by the Forty-seventh Congress went through the Senate March 9, 1882, Gen. Harrison's name not being recorded on the final vote, although the day before it is found among the yeas on two unsuccessful amendments intended to liberalize the measure. The bill was vetoed by President Arthur, and on April 5, 1882, the question was put, "Shall the bill pass, the objections of the President to the contrary notwithstanding?" And Gen. Harrison voted nay. A new bill, intended to meet the President's objections, came before the Senate April 25, 1882, and again April 28. Amendments were brought forward still further to liberalize the proposed policy, including one which aimed to strike out the section providing that no Chinaman should ever be admitted to citizenship, for all of which amendments Gen. Harrison voted. The bill was finally passed by a vote of 32 to 15, and among the nays is found the name of Gen. Harrison.

The *Journal's* paragraph is doubtless intended to meet the objection urged against Gen. Harrison's candidacy, that he has a bad "record" for the Pacific Coast on the Chinese question; but his record cannot be disposed of by denials of the truth. The fact is, that Gen. Harrison voted against the Chinese Restriction Bill as it now appears upon the statute-book, and it is a vote of which he may well be proud. It is an unfortunate circumstance that the supposed necessities of a Presidential candidate for Pacific Coast purposes render his champions eager to explain away and even to deny action so greatly to his credit. Moreover, Gen. Harrison is no worse off in this matter than other possible Republican candidates who were with him in the Senate. On the final vote against the present Chinese Exclusion Bill, Messrs. Allison, Hawley, and Sherman voted in the negative with Gen. Harrison. This vote may prove fatal to the chances of each for a Presidential nomination, but doubtless each would "rather be right than be President," and all four of them were right on this occasion.

The latest figures from Rhode Island on the working of the prohibitory law there are more startling than any which have gone before. It has been previously shown that there are more liquor saloons under prohibition than there were under license, and now it is shown that there has been a great increase in drunkenness and crime during the past year, as compared with the first year under prohibition. The official figures upon the latter points were presented to the Legislature last week. They show that during the last six months under license in 1885 the number of arrests was 3,398; during the last six months of 1886 the number was 2,262, but during the last six months of 1887 it reached nearly its former dimensions, being 3,090. During the last six months of 1885 there were 2,529 cases of drunkenness and revelling; during the same period for 1886 there were 1,475 cases, and during the same period for 1887 there were 2,180 cases. Upon cases of common drunkards, the showing is worst of all. There were during the last six months of 1885, 60 of these, during the same period in 1886, 23, and during the same period in 1887, 79.

It is evident from these figures that the State is suffering all the evils which flow from the unrestricted sale of liquor. No attempt is made longer to enforce the law. Liquor is sold more freely in the city of Providence than it was under license, the number of saloons to population being one for every 206 persons. The average under high license is about one to every 400. But this free sale is not all the harm that the law is responsible for. During the first year that the law was in existence there sprang up in all the cities of the State a host of so-called private "club-rooms" which were merely secret drinking-places. The inevitable effect of these was to make drunkards of men who would never have become so under other conditions. The figures now given show the results in the increase of common drunkards. We do not seek to underestimate in any way the evils of bars and saloons. We regard them as a curse everywhere, and would rejoice to see them all swept from existence; but, great as their evils are, those of secret drinking and of unrestricted drinking are greater. Prohibition is worse than a folly when it leads to results like these.

We are glad to be able to quote the New York *Times* in corroboration of our views concerning intercollegiate athletic contests. From an editorial article in its Sunday's issue, designed to show that our colleges are no longer purely educational institutions, we take the concluding paragraph, which we commend to heads of colleges and to parents generally. The italics are ours:

> "Here, we think, is the real justification for intercollegiate athletic contests. To defend them as really conducive to scholarship can hardly be done with a straight face. To endorse them as cultivating a manly spirit goes for something, but not very much. Conceived of as part of a strictly educational system, they are not even partially a good. In an ideal university, where men came only to study and fit themselves for the serious business of life, they would have no place. *But as one of the manifestations of increasing luxury now prevalent in society, and through society in the colleges, they will have to be borne with as best they can.* The colleges cannot abolish them without either repelling from themselves a part of their students, or allowing the latter to invent some still more objectionable substitute."

The fears of war in Europe as the spring approaches are growing. Russia is moving in the Bulgarian matter, though with but slender prospects of any success through negotiations. She wants Turkey to take the chestnut out of the fire by warning Prince Ferdinand that he is an intruder and must decamp; but Turkey shows no disposition to comply, knowing that if she attempted to interfere alone, Bulgaria would resist, and probably resist successfully, and that the attempt would probably end in the appearance of Austria on the scene, and a general mêlée, in which, no matter who won, the Turks would be sure to lose ground. As the Russian preparations continue, what good observers apprehend is that Russia may force the French, in spite of their peaceableness, to take the field on the now-or-never principle. Without Russia the French cannot fight, and if Russia says this is the last opportunity she will offer for an indefinite period, they may, however reluctantly, seize it.

The Russian "explanation" about Bulgaria really explains nothing. What it sets forth is in reality that Bulgaria owed her existence to Russian efforts and sacrifices, which is true, and that therefore Bulgaria is bound to choose a Prince and carry on her government under Russian advice and dictation, which the Bulgarians deny. The only objection to the two Princes who have occupied the throne is that they were not selected by Russia. No one pretends that they were not (as the Treaty of Berlin intended they should be) the free choice of the Bulgarian people. The treaty required that the Prince's election should secure the ratification of the Powers, and the only reason why it has not done so is Russia's refusal to concur. How the Czar's approval is ever to be secured for a choice which he has not been allowed to dictate, or how the Bulgarians are ever to be got to permit him to name a Prince for them, does not appear. The problem at present looks insoluble, but as long as nobody is allowed to meddle with them, the Bulgarians will hardly care whether it is ever solved or not.

THE IOWA RAILROADS.

Gov. Larrabee of Iowa incorporated in his message to the Legislature the other day the most furious attack on the railroads made since the Granger excitement fifteen years ago. The debt, funded and unfunded, of the railroads within the State is $25,350,000. The net earnings give on this amount a return of a little over 6 per cent., leaving nothing for the holders of the stock as a whole. This does not seem a very prosperous state of things for investors, but it is, nevertheless, apparently, in the Governor's eyes, too prosperous by half. He recommends legislation fixing the maximum passenger fare at two cents per mile, which he says will not hurt the companies, as they will be compensated by increased travel, which may be true. What surprises us is that no railroad reformer of the Governor's thorough type has suggested carrying passengers by weight. It would be hard to furnish any argument against it, except the trifling inconvenience of weighing passengers when taking their tickets, and the annoyance to heavy women of having their weight made known to the ticket agent. This could, however, readily be reduced to a minimum by a little privacy in the weighing process. All the conditions of railroad traffic, as set forth by experts, make the weight of passengers just as important as the weight of goods or cattle, which is always carefully ascertained and made the basis of charges. At present there is apparently a very unfair advantage enjoyed by stout persons of both sexes. In fact, it would be difficult to justify on paper the universal custom of making a one-hundred-pound woman pay exactly the same fare for the same distance as the two-hundred-pound man.

Gov. Larrabee further recommends "the passage of a law fixing reasonable maximum rates of freight in the principal commodities transported by rail, and authorizing and requiring the Railroad Commissioners to reduce said rates at any time when, in their judgment, they are too high." "If it should be held," he adds, "that the Legislature cannot delegate to the Commissioners the power to absolutely fix such rates, then they should be regarded as prima-facie reasonable rates." The proposal to fix rates on freight by an act of the Legislature is, we believe, something entirely new, going beyond anything hitherto proposed in any country in the matter of regulation of railroad property. The utmost that other civilized States have done is to create commissions or boards to consider, through actual judicial investigation, what "reasonable maximum rates" are. No Legislature has, we believe, thus far taken this task on itself. One inevitable result of such a policy as the Governor recommends would be the appearance of freight charges as an issue in every State canvass, and the candidate who was in favor of cutting them down to the lowest point would naturally have the strongest claim on the favor of the constituency, and the only recourse open to the corporations to save themselves from ruin would be a considerable extension of the much talked of "use of money at elections."

The general result of the Governor's recommendations has been that there are now before the Iowa Legislature seventy-five different bills introduced since January 10, each providing for some sort of regulation of railroads. One of them fixes the passenger fare at two cents per mile, but another provides for the creation of an *elective* commission of five persons charged with the duty of establishing freight tariffs, or, in other words, to all intents and purposes takes the management of the roads out of the hands of the owners, who unfortunately are mainly non-residents. If they were not, the fact that railroads, besides being public highways, are also private property, and have in Iowa, as in other States, been constructed in the main with the savings of individuals, would probably not be so readily forgotten as it is occasionally in some of the Western States. The Granger attack on the Iowa railroads in 1878 was brought to a summary close by the prompt refusal of the owners of capital either to invest or lend in the State. Under this cooling influence there was a rapid disappearance of the anti-railroad excitement.

The present one will probably die out under a similar influence, but we wonder whether the railroad managers ever seriously consider the extent to which they suggest or stimulate these assaults on their property by the "wars" over rates. One of these "wars" is now raging in the West, and it, like the others, has brought about reductions below what even Grangers think "a reasonable maximum," and, of course, inevitably suggests to the rustic moralists who live along the lines that if railroads can afford to carry goods at such low rates in order to damage rivals, they can carry them at the same rates to accommodate the public, if proper compulsion be applied. In fact, nothing does so much to debauch public opinion about railroad property as "wars." They seem to justify the charges of extortion made by the most rabid reformers, and exhibit the managers in a poor light as regards good sense and business prudence.

EXTRAORDINARY STORY ABOUT HOLLAND.

We would warn Mr. Chauncey M. Depew and other Republican orators that, if the forthcoming Presidential canvass is to turn on the tariff, the discussion must be serious and careful, because people are not going this time to let random assertions about the effects of tariff legislation pass without examination. We are moved to make this observation by the following extraordinary passage in an interview with Mr. Depew at Chicago, which appeared in the New York *Tribune* on Sunday:

"Four years ago, when I was abroad, I went to Holland. When I went over there, I found that there was more content and happiness in Holland than in any country in Europe. There was absolutely no pauperism. When I was in Holland last summer, I found a great deal of complaint, stagnation in labor, Socialist riots, labor troubles—things which had never been known in the country before. I met one of the most eminent business men in Holland, and he said to me that the manufactures of Holland were stagnant, that business in Holland was no longer remunerative, and there was a great deal of poverty and distress among the mechanics and laboring classes. I said to him: 'How do you account for this change?' He said: 'Because Holland adopted a few years ago free trade, and the law has ruined us.'

"'Well,' I said, 'give me some instances.'

"'Well, for instance, we raise in Holland a very superior breed of cattle. England is free trade nominally, but when she found that our cattle coming from our farms were destroying her cattle industry, when she found that we could send better cattle at cheaper prices than she could raise them, she was free trade, and, of course, could not tax them, but her Board of Trade issued an ordinance that all Holland cattle had pleuro-pneumonia, and have not permitted a head of cattle to enter England for four years. That is the free-trade way England has of protecting her industries when they are pinched.'

"'Well,' I said, 'why, such being the case, does not Holland return to protection?' He said: 'Because our manufacturers and business men are not our Government. Our Government is a non-producing class, and they are all theorists, and they are carrying out their theories and ruining the agriculturists and manufacturers and general business and labor of the country.'"

Upon this the editor—not, we are sure, Col. Grosvenor, who is, though a farmer, too wary for that—made the following sapient remarks:

"Mr. Depew's statements about the effects of free trade in Holland, reported in an interview had with him in Chicago, are commended to all free-traders, and to those protectionists, if there are any such, who may be wavering in their faith. Under free trade, business in Holland has become unremunerative, and poverty, distress, labor troubles, etc., have followed. This ruinous policy, Mr. Depew was told last summer, is persisted in because the men at the head of the Government 'are all theorists.' Theories that do not stand the test of experience are worthless. Protection has stood that test and cannot be regarded as a theory."

It seems a pity that any one should visit a country so interesting as Holland with little or no knowledge of its social or economical history. The "eminent business man" whom Mr. Depew consulted performed on him the process which the boys call "stuffing." Holland has been a free-trade country for centuries, except under the French Empire and during the union with Belgium. Since the separation from Belgium, that is, for the last fifty-eight years, she has lived under a low tariff, which has been gradually getting lower. Revisions of the tariff in the direction of free trade took place in 1845, 1850, 1854, and 1881, the national prosperity increasing all the while, Holland being the only European country which passed unscathed through the financial crisis of 1866. Mr. Depew will probably be surprised to hear that the customs duties were only, in round numbers, one-eleventh of the revenue in 1850, one-thirteenth in 1862, one-sixteenth in 1873, and one-twenty-third in 1879. During almost the whole of this period Holland has been more of a free-trade country than any in the world. This diminishing proportion of the customs duties has been due simply to increase in the sum total of the revenue.

"The eminent business man" was humbugging Mr. Depew when he told him about the establishment of free trade "a few years ago," for the returns from customs duties have hardly varied in the least for nearly forty years. They were (in round numbers) 5,000,000 florins in 1850, 5,000,000 in 1862, 5,000,000 in 1873, and 5,000,000 in 1878 and 1879. The tariff was lowered slightly in 1881, but

the duties may now be said to average 5 per cent. ad valorem on dutiable articles, which are but few in number. The only talk of change in the tariff since then has been a proposal laid before the States-General by the Government, not to lower the duties, but to increase them on sawed wood, petroleum, tea, various fruits, and articles containing sugar. Whether this has been carried into effect we do not know, but if it has, the conduct of the "eminent business man" was all the more culpable. Moreover, under this low and decreasing tariff, Dutch commerce with England has not declined relatively. The British exports to Holland were, during the five years ending in 1884, 6.2 per cent. of the total to all countries, or as much as they have been at any time since 1866, save in the exceptionally prosperous five years ending in 1875. The Dutch exports to England show similar results. They amounted in 1884 to 6.6 per cent. of the total to all countries, which was more than they had been in any previous year since 1866.

How to approach Mr. Depew's illustration of the working of free trade in Holland we hardly know. It appears from this that the prohibition of the importation of Dutch cattle into England by the British Government is an "instance" of the way in which a Dutch free-trade "law," adopted "a few years ago," has ruined the Dutch. The thread of the argument here entirely escapes us. We hope it is visible to Mr. Depew. It seems to us, as the human mind is at present constituted, an instance of the way *British* protection ruined the Dutch. But we will let him have it his own way, if he will only give attention to the following facts: that the trade of the Netherlands with Great Britain has been steadily increasing for a great number of years, the exports to that country having risen from (in round numbers) $75,000,000 in 1875 to $125,000,000 in 1885; that of this amount "live animals" formed only one-twenty-fifth of the total in the last-named year, and that the great bulk of the live animals exported to England are not "a superior breed of cattle," but sheep and lambs. He will perceive what a ridiculous story "the eminent business man" told him, when he learns that while Holland supplies 39.8 per cent. (in value) of all the butter Great Britain imports, and 17.9 of all the cheese, and 31.0 of all the refined sugar, and 9.9 of all the tobacco, and 17.9 per cent. of all the cocoa, and 27.3 of all the sheep and lambs, she supplies only 3.2 per cent. of the oxen, bulls, cows, and calves. As to the "pauperism" which Mr. Depew says did not exist in 1884, but which he found last year, there appears to be a little of the cock and the bull in this story too. The number of poor relieved in 1880 was 216,532, or 5 per cent. of the population; in 1881 216,643, in 1882 213,270, in 1883 214,516. We have no returns for 1884-5-6, but shall be glad to have Mr. Depew furnish them, together with a copy of that free-trade "law" which has ruined the Dutch.

There has been great commercial depression in Holland, undoubtedly, as in all other European countries since 1880, or four years before Mr. Depew was last there, but the tariff has had nothing to do with it, for the simple reason that Holland can hardly be said to have a tariff. The report of the Rotterdam Chamber of Commerce for 1886, which appeared in 1887, says, "The fall in prices since 1880 amounted on the 1st of January, 1887, to 12 per cent. for coffee, 43 per cent. for sugar, 25 per cent. for wheat, 26 per cent. for cotton, and 35 per cent. for indigo," as showing the cause of the trouble.

THE CIVIL SERVICE AS A PROFESSION.

Mr. Punch's advice concerning matrimony may be good, but we have never heard of any one who has followed counsel given with such oracular conciseness. Yet this, we believe, is uniformly the advice given by "such as ought to know" to those who ask them about the subject named above. Men at both ends of the official scale—Congressmen who have got places for hundreds of protégés, and poorly paid clerks who have grown gray in the service (in the rare cases when such are found)—agree in this, that the lowest round of the commercial or professional ladder is to be preferred by a young man to the most attractive clerical position in the Government service. And, in fact, the number striving for such places is much smaller, under the system of civil-service examinations, than any one familiar with the pressure under the spoils system would have deemed possible. The politicians ascribe this to what they are pleased to term the fact that the ones who would often, if not usually, make the best clerks are those whose "schooling" has been neglected. Another reason is the feeling, said to be especially common in the Southern States, that to submit to an examination is, for a person whose school-days are over, undignified, if not humiliating. But the chief reason is that the civil service, though not so bad as it is painted, is intuitively felt by the public to be a poor career for a youth of ability and energy, in a country where opportunities of getting a living are so numerous, and the prizes, in every direction, so great. It is perceived by none more clearly than by the clerks, that to adopt the service as a permament means of livelihood is to condemn one's self to hopeless mediocrity; and few, therefore, have so chosen it. Their mistake has been in supposing they could free themselves from its chains—in failing to discount its soporific influence. They have thought to use it as a life-preserver while learning to swim, and in a few years to graduate from it as physicians, lawyers, or expert accountants. But though the preliminary studies are often successfully made, few indeed have the courage to risk a bird in the hand for two in the bush. The apparent exceptions to this rule would generally be found to be those whose resignations (often through no fault of theirs) have been involuntary.

We should remember, however, that if not mostly fools, as Carlyle has it, the greater part of us, even if college graduates, are hardly destined to reach the top of any worldly tree, so that the fact that there is plenty of room there has no bearing on our individual fortunes. That it is better to have loved and lost than never to have loved at all, may be a good principle, subjectively considered, but it is not one that can be translated into practical terms. The vast majority of mankind must expect to be wage-earners, so that the question to be decided is whether, as a civil servant, one is not likely to get more comfort out of life than as a poor professional man, or schoolmaster, or journalist, or business clerk. In these callings you may, at fifty, have won your way to a few hundreds per year more, but at a how much greater sacrifice of convenience and leisure, and all that this implies! In business houses, except where the work is exceptionally light, and the pay correspondingly low, the clerk must be at work ten or twelve hours, often more; he breakfasts by himself, and dines after his children are asleep; or, if marriage has not early forced him to renounce expensive habits, he finds that the vain struggle to make both ends meet is bearing him onwards to the grave at an unexpectedly rapid rate. Now, the Government clerk has twice as long a vacation as most wage-earners receive; he has to work (with rare exceptions) but seven hours a day; his work is done in well-lighted, well-ventilated, and well-furnished rooms, and, if he lives in Washington, and has no social aspirations, he will find that two dollars will go as far as three in New York or Chicago.

Whoever thinks of entering the service had better not only leave behind all hope of distinction, but be prepared, even if the Civil-Service Act continues to be maintained, for disappointment and mortification. These may, indeed, begin before a man is born into the official world, and we should not advise any one to buy a ticket for Washington on the strength of getting 90 or even 99 per cent. in the examination. Under the old system, many tried and some succeeded in elbowing their way to the official table; under the new, many are called but few are chosen, and the few are sometimes known before the examination is held. Therefore, let the candidate observe carefully whether he has passed a "general" or a "special" examination, for if the latter, his chances of appointment are slight. In special examinations (as for examiners in the Pension Office) the entire eligible list is sent to the appointing officer, and the man at the foot of it is as likely to be appointed as the one at the head. If appointed, the clerk naturally supposes that capacity and attention to his duties will secure promotion, and so they may; but it would be well not to expect much. The influence of political patrons, from being general, has become concentrated; and the more their influence has been limited in scope, the more tenacious are they with respect to what is left. The effect of this is unpleasantly evident whenever a batch of promotions is announced, when the industrious and competent are often passed over in favor of the stupid, the careless, or the idle. This is especially annoying when a clerk finds himself promoted to work requiring greater knowledge or intelligence, while a mere copyist, without change of duties, receives the corresponding increase of pay. The proposed rules to enforce examinations for pro-

motion *may* do something to lessen this evil, but we believe the clerks have no faith in them. The bearing of rules, as of remarks, lies in the application of them; and considering the large proportion of marks given to "efficiency," of which the "Chief of Division" is the sole judge, it will be seen that the result of an examination will be very much what the authorities wish to have it.

There remains to consider but one more phase of the question—what we may call the moral aspect. That civil servants in general are dishonest, or would be if they had the opportunity, we do not believe; but the recent experience of the horse-claims division of the Treasury, and that of the Chicago Post-office in connection with its newspaper mail, are illustrations on a large scale of what many clerks learn to be familiar with in less important instances. Familiar, we mean, in the sense that they know more or less about them, and yet hold their tongues, partly because of the inconvenience and possible danger to which the opposite course would expose them, and partly because of the generally accepted maxim that the informer is worse than the thief. Add to this that the civil servant is generally unthrifty, though the precariousness of his tenure of office, and the uselessness elsewhere of experience acquired in it, ought to have made him, of all men, the most careful to have something laid by for a rainy day. Whatever else may be said of it, it must, we think, be admitted that the atmosphere of the civil service, whether in Washington or elsewhere, is not stimulating to the moral faculties. As we have hinted, there are various reasons for this, but perhaps one stronger than any other is that instead of being, what it possibly some time will be, composed of those who have chosen it as a profession, a large proportion of the men employed in it are, in a sense, men who, though not necessarily by their own fault, have failed in life, and have to be taken care of.

THE BLENDING OF THE DENOMINATIONS.

That the edge has been worn off the distinctive tenets which gave birth to the great Protestant sects is generally admitted. It is of course implied in the modern movement for denominational union, and is a condition precedent of that movement. What is not so commonly seen and acknowledged is the process of interpenetration, as it may be called, which has long been going on among the several denominations. Not only have the old barriers been broken down and partially effaced, but, as was inevitable once the fences were down, the different flocks have become somewhat mixed. With the cessation of active hostilities between the sects has come no little interchange and assimilation of opinions. The peculiar property of one or two has become the possession of all. What all once fought, all now embrace. The old boundaries can still be traced by those of an antiquarian turn, but they now include many things that they were meant to shut out, and have allowed many things to escape that they were meant for ever to shut in.

Several suggestive bits of evidence going to prove the truth of this have lately fallen under our eyes. A recent number of the *Unitarian Review* contained an article on "Church Extension" which was wholly based on the idea that there was such a thing as the enlargement of a denomination without building a single new church or winning a solitary confessed convert. The writer of the article referred to maintained that there is a noticeable spread of opinions for which the Unitarians have always stood, among the other denominations. He adduced the much greater emphasis laid upon life than upon creed, and the fuller recognition of the duty of the Church towards society, as positions which could no longer be declared preëminently Unitarian. His conclusion was that Unitarianism is to expect an extension of its influence more in the way of a leaven affecting the life of other sects silently, and from within, than in visible and numerical growth. It is very easy to say that this is making a virtue of necessity. Perhaps it is, partly; yet the facts may be as alleged, nevertheless. It is certain that the most eminent of the surviving Unitarians of the Channing type has declared that the Unitarian schism would never have taken place if New England Congregationalism had been a hundred years ago what it is to-day. There is, in fact, no lack of evidence that the Unitarians who are now fighting Congregationalism are fighting what their fathers were, and that many Congregationalists are what their own fathers fought.

Passing over to the competitors of the Congregationalists on the other wing, we are given a hint of the general denominational flux by the recent meditations of the *Observer* upon the subject of the New Theology. That journal had interrogated five or six hundred Congregational ministers as to their attitude towards the new views, and had found that, apparently, not more than twenty-five out of them all would confess to leanings that way. Its first conclusion was that the whole thing was another case of Sydney Smith's solitary clergyman wandering into a room lined with mirrors, and imagining that he was in a large gathering of the clergy. But reflection appeared to convince the *Observer* that this was a fallacious inference, and that where there was so much cry there could not be so little wool. In a later article, accordingly, it dwelt upon the possibility of a secret and insidious spread of the New Theology in places where its presence was not confessed, or, perhaps, suspected. It feared that, if the truth were known, New Haven would prove to be as badly off as Andover. It also hinted at infection in "other seminaries." What it meant is, of course, known only to itself, but it certainly might have been squinting at some seminaries of its own denomination. A singular feature of a recent editorial in the *Andover Review* was an appeal to Congregationalists to be as fearless in Biblical criticism as a certain Presbyterian professor! And the *Observer* has had evidence of the way laxity may creep into even the straitest sect, especially, as it says, in the case of young men, in some late examinations before the Presbytery of New York. Such offences must needs come, and they probably will come in increasing numbers. There is no way of laying an embargo on thought. We have high Presbyterian authority for saying that no seminary can undo the work of a college in forming habits of inquiry and standards of belief, and the colleges of to-day are the worst enemies of the theology of to-day.

Perhaps the most striking instance of one denomination giving color to another is to be seen in the remarkable spread of the liturgical movement among those branches of the Church that had inherited all of Jenny Geddes's dislike of a prayer-book. The first inroads of this movement gave great alarm to those conservative leaders who withstood them in vain. They feared that the next step would be going over bodily to Episcopacy. Some among the Episcopalians, also, were sanguine enough to think that the drift towards a liturgy was a drift towards their denomination. But the clearer heads on either side saw that the fear and the expectation were alike unfounded, and that this approach in the use of forms was consistent with a real strengthening of sectarian prejudices. Indeed, a prominent Presbyterian has declared that he knew of nothing which could have prevented a serious defection from his denomination to the Episcopalian, except the great enrichment effected so generally in the forms of worship in use among Presbyterian churches. Much might be said for that view.

This last case is a good illustration of the small significance, as bearing on denominational union, of denominational convergence in some points of belief and practice. The denominational instinct—and denominational differences are now more a matter of instinct and inheritance than anything else—is yet too strong to make the discussions of plans of union seem aught but academic. There is no better proof that professors and editors are out of touch, very often, with the masses of their own sect, than the fact that they seem to have no idea of the mingled anger and contempt with which their proposals to abolish sectarian distinctions are looked upon by the great body of the members of the churches. The latter may be like the Scotch Covenanter in not knowing very much about their creed, but they are also like her in being ready to "mainteen" it against the world.

EVENTS IN IRELAND.

Dublin, February 15, 1888.

Nothing could better illustrate the altered sentiments of the Irish masses towards England than the reception lately accorded to the Marquis of Ripon and Mr. Morley. The Dublin trades, in their thousands, turned out on a cold winter's night to welcome them with bands and banners; the largest hall was crammed with an enthusiastic pay audience to hear their speeches, while the freedom of the city was presented to them by the corporation, and at a reception they were offered addresses by some sixty of the Irish representative bodies. For the first time that I remember, union jacks floated beside green flags at popular gatherings. The warmth with which Mr. Morley and his speech were received was the

event of the principal meeting. The attempt to raise the *odium theologicum* against him signally failed. The columns of the Unionist papers had for weeks displayed shocking extracts from his writings on Voltaire, Rousseau, and the Catholic Church, the same being posted in placards throughout the city. Yet he had a heartier reception even than Lord Ripon, a zealous convert and a munificent benefactor of the Church. This was due to appreciation of Mr. Morley's services in the cause of Ireland, and to a generous opposition to the attempt to prejudice him in the popular mind. What men desire nowadays is to live as quietly and comfortably as they can in *this* world; dogmatism regarding the next carries little weight when it interferes with their aims here. We could hardly have better instances of the decline of religious rancor than the British Government moving heaven and earth to induce the Pope to bring the naughty Irish to order, and the naughty Irish lavishing honors on a man of John Morley's opinions.

The Ripon-Morley reception was most important in the number and weight of the middle, commercial, and upper classes that it brought out in favor of a home-rule settlement, and in helping to render home rule respectable. At private receptions and dinners, at a conversazione attended by some 1,600 (paying) guests, amidst music and flowers and tasteful decorations, in crowds of well-dressed and well-mannered people, it was interesting to meet those who never before identified themselves with the cause, and would have nothing to do with it now if they believed it meant disorder and disunion. Two parties alone had any real cause for dissatisfaction—the ascendency class, who are so rapidly losing their predominance; and the extreme party, whom nothing would content but an ideal republic and a fair division all round. Thankful we are to perceive that under the influence of Mr. Parnell's and Mr. Gladstone's statesmanship the latter party is steadily diminishing—that, in Parnell's words, "For one that favored parliamentary agitation to nine or ten that looked to violence and revolution as the true means of saving Ireland twelve years ago, we now have the proportions reversed." When every other prognostication and unfavorable suggestion failed regarding the reception, the question of the "Queen's health" was resorted to, and we heard that "a banquet was abandoned and a conversazione arranged so that the Queen's health should be avoided." We were next told that we had refused the toast, and then when there was, in addition to the conversazione, a banquet with the Queen's health in due form, a greater outcry than ever declared that "It was not drunk—it was swallowed." "It was proposed inaudibly." "It was a piece of acting to delude the English people." This making such a point of the Irish at large drinking the Queen's health and playing "God Save the Queen," is most futile. Both observances have been made party shibboleths, and are connected with all that is hateful and humiliating to the masses of the Irish people. The Queen has never shown Ireland a gracious side. If Ireland form a real working union with England, it signifies little whether or not we play the English national anthem and toast the sovereign. At the Leinster Hall meeting I was much struck with the fact that an expression of feeling by a large assembly must be sincere. The faint response to Lord Ripon's denunciations of outrage contrasted with the enthusiastic applause greeting all references to union with the English people and a good understanding between Catholics and Protestants in Ireland. The former response was less a cheer than a sigh, the expression of the conviction that outrage has been inevitable, and that we cannot expect to be free from it until its causes are removed.

Attendant upon the present large reductions of rent by the Land Commissioners—in many cases from 25 to 30 and 35 per cent.—there has been an almost complete surrender to the plan of campaign by the great proprietors. Much has been said about Glenbeigh, Mitchelstown, and Bodyke. Cruel evictions have taken place, small armies have been kept on foot, peasants and leaders have been imprisoned in scores, police and emergency men have been injured, Irishmen shot down—the properties for a time remained a waste—and now the owners have given in, the tenants' terms are accepted, arrears are to be wiped out, law costs paid, the evicted are to be reinstated, the ruined homesteads rebuilt. If there be any sincerity in the Government plea that the plan of campaign is a criminal conspiracy, Lady Kingston, Lord de Freyne, Col. O'Callaghan, and a host of others in like position, are guilty of compounding a felony. The Luggacurran (Marquis of Lansdowne's) difficulty is, I believe, in a fair way of settlement. The Lord of Clanricarde alone holds out against reasonable compromise. Within the last few days he has offered terms which would doubtless two years ago have formed the basis of a settlement, but which are now impossible. The tenants will never agree to any arrangement that does not include the reinstatement of the evicted, whose sacrifices in every instance have been a necessary factor of the struggle. Round the Clanricarde contest much of the interest of the last few months has centred. Owing to it Mr. Blunt and other well-known men are in jail, for it most of County Galway is in confusion. There the Crimes Act is being administered with relentless and almost incredible severity. Men are being imprisoned with hard labor for "intimidating" others, even where the "intimidated" swear they have not been intimidated at all; and then when the prisoners leave jail, others are incarcerated for rejoicing at their release. One case was related to me on good authority in which the "intimidated," like his neighbors, illuminated his house on the expiration of his "intimidator's" sentence, and where the police entered and obliged him to extinguish the candles.

Fresh interest has been drawn to the Clanricarde contest by Mr. Shaw Lefevre's chivalrous espousal of the tenants' cause at considerable personal risk. In company with a number of other English members of Parliament and sympathizers, he held a mass meeting on the 10th to express feeling for the tenantry and adopt a petition to Parliament. The Government did not interfere, and perfect order and good humor prevailed. It was, indeed, an impressive scene, calculated to touch the deepest emotions, that English-crowded platform, the breathless multitude of eager, intelligent, determined peasantry, in a setting of green fields, glistening lake, dark Connaught hills. I have lived through more than my share of great events—the downfall of American slavery, the unification of Germany and of Italy, the elevation of the position of women educationally and otherwise—and that occasion at Loughrea more than ever encourages me to hope that I may yet see what perhaps comes closer to me, though not the weightiest reform, the reconciliation of England and Ireland. We must not be too sanguine as to the Clanricarde settlement, and there may yet be bad work. The people are now so exasperated that they do not incline to consider anything but what they deem most likely to stave off further eviction. The rental is of no real account to their landlord, as it has been in other cases where arrangements have recently been made. After permitting this meeting of Mr. Lefevre, the Government can hardly continue to incarcerate Mr. Blunt for attempting to hold one on similar lines.

Mr. T. M. Healy is perhaps the ablest and most versatile, as he is the most personally beloved by those who know him, of the Irish Nationalist members. The son of a country postmaster in the south of Ireland, an obscure lad employed on an English railway, he has, within ten years, won a foremost place in Parliament and a world-wide name. He has qualified himself for the bar, and probably has a great future before him. His real life is in his home and in literature. At times he is the despair of his friends, and perhaps of his better self, in his bitter and unguarded language. Single-handed he has just fought and won a remarkable contest with the Irish courts. John O'Sullivan was on the 17th of January sentenced at Killarney to one month's imprisonment with hard labor on a charge of having taken part in a "criminal conspiracy to compel John Hartigan not to work for Agnes Curtin." (The boycotting of the Curtins, to which I have before referred, a disgraceful business from beginning to end, has nothing to do with the merits of this case.) There was no evidence whatever of conspiracy on O'Sullivan's part. He refused to shoe Mrs. Curtin's horses weeks after Hartigan had refused to shoe them. Nevertheless, he was convicted. The magistrates declined stating a case for a higher tribunal, and as the sentence was for a month only, there was no appeal. Mr. Healy took up the matter, and on the 30th of January applied to the Queen's Bench for a *certiorari*. The Crown argued that the court had no jurisdiction. The judges at first scouted the idea; but afterwards "changed their minds" when they saw the nature of the case. Right or wrong, under the Coercion Act, the decision of the magistrates could not be reversed. Nothing daunted, Mr. Healy, against the advice of his legal friends and the reminder that, after all, O'Sullivan's term would be up in a few days, carried the case on to the Exchequer Division, over which presides the Lord Chief Baron, Palles, who, of all Irish judges, has connected with his name least suspicion of partiality towards the Government. Of him, an eminent English member, Mr. Ellis, uses these words: "I may say it is a good thing that in this grievous crisis of the history of Ireland there is a man who is absolutely fearless on the Irish bench, and whose mind is saturated with the traditions of law." Unlike their English brethren, the Irish judges adjourn their courts and attend levees. The other day in the very law courts they gave a lunch to the Chief Secretary, Mr. Balfour.

The Exchequer Division proved more independent than the Queen's Bench. The conditional order was issued, and the question argued out for two days. The Crown contended that under the act there was no power in any court to interfere with the magistrates' decision. Baron Dowse asked, "If a magistrate committed a man without any evidence at all, do you say there could be no *habeas corpus?*" To which the Crown counsel answered, "I do." Baron Dowse: "Is not the absence of evidence of an offence matter that concerns the jurisdiction?" Crown counsel: "No; the warrant of the magistrate is conclusive of every fact stated in it. . . . There was no power to interfere with it." A writ of *habeas corpus* was granted. O'Sullivan was brought up a few days after and discharged; the last piece of absurdity being that even with the order of the court he could not be released

without a six-shilling stamp on the order, and, the stamp office being closed, the prisoner and his warder were relegated to a hotel for the night. Mr. Healy made touching use of his victory in a public appeal against the boycotting of the Curtin family. The decision has been a stunning blow to the Crimes Act. To-day there is a report that the prosecution of newspaper proprietors and venders is to be discontinued. The act is breaking down. It was to be carried out "thoroughly," but it was an anomaly essentially inconsistent, and foredoomed to the failure that overtook all previous attempts at coercion.

What was to have been a strictly non-Irish session of Parliament is opening with passionate discussion regarding Ireland. D. B.

A FRENCH VIEW OF BISMARCK'S SPEECH.

PARIS, February 8, 1888.

THE all-absorbing subject of interest at the present moment is the publication of the treaty made in 1879 between Prussia and Austria, and the speech pronounced a few days after this publication by Prince Bismarck before the Reichstag. The publication created some surprise, not on account of the treaty itself, for everybody knew that it existed; but people have naturally asked themselves why the publication took place. The speech of Prince Bismarck is, to a certain extent, an answer to this question. It is quite clear that the Prince did not think himself justified in asking new and enormous sacrifices from the German people without placing before them the real state of European affairs. He tore aside every veil; he showed, with the greatest frankness, the dangers to which the new German unity was exposed—dangers which are perhaps not immediate, but which are permanent; and his fairness was recompensed by the unanimity of the decision made by the Reichstag. There is a French proverb which says, "Un homme averti en vaut deux." The Germans have been warned, and whatever may be said of the high character, of the great sense of honor, of the Emperor of Russia—whatever may be said, also, of the pacific character of the new French President—Prince Bismarck does not conceal from his countrymen the fact that a coalition between France and Russia is among the possibilities of the future, and that Germany must stand prepared to send a million of men to the east and a million of men to the west.

He does not allude in his speech, and nobody expected that he would, to the recent *rapprochement* of Baron Mohrenheim, the Russian Ambassador in Paris, and M. Floquet, the President of the French Chamber of Deputies. At the time of the visit to Paris of the father of the present Emperor of Russia, when Alexander was descending the steps of the Palais de Justice, which he had visited, a young lawyer, who was not far from him, exclaimed, "Vive la Pologne, monsieur!" It was always said that this lawyer, who was then obscure, was M. Floquet; at any rate, M. Floquet did not think it necessary to deny it for many years, and the Russian Ambassador was forbidden to have any communication with him. But things have now been arranged; the friends of M. Floquet say that the insult to the Emperor was offered by another lawyer, the son of a Polish lady (to be sure, this other lawyer is now dead and cannot deny the statement); the cry "Vive la Pologne!" has become a sort of legend, and will soon be called a fable. M. Floquet, who was one of the candidates for the Presidency, is considered as the possible, even the probable, successor of the present Premier. He has, in fact, become one of the factors of the Republican policy, and his importance arises from the fact that he is supported by the Radicals, and has the sympathies of a certain faction of Opportunists at the same time.

It would have been somewhat improper to allude to these incidents in the German Reichstag; but they are as well known in Berlin as in Paris. There is no doubt that great efforts are made by a certain party in St. Petersburg, as well as in Paris, to bring about an understanding between Russia and France. But there's many a slip 'twixt cup and lip. Prince Bismarck can show to the world and to his own country treaties, written engagements; he has published his treaty with Austria; he may publish, if he likes, a treaty with Italy; he even, in his speech, spoke of "other Powers," without saying which those Powers were. France and Russia can show nothing of this sort. What are a few newspaper articles, and the utterances of irresponsible persons, compared with solid facts? There is an alliance between northern Germany and Austria, there is an alliance between the German Powers and Italy, there is no alliance between France and Russia. The utterances of the Russian press and of a part of the French press are of little importance in the eyes of Prince Bismarck. He speaks with contempt of the writers who seem bent on frightening the printer's ink; he has the greatest confidence in the character, in the honor, of the Emperor of Russia; he cannot complain of the public authorities, such as they exist in France.

It is certainly a curious fact that while, in the old Chambers of the Restoration and of the reign of Louis Philippe, there were always a few members, representatives of a warlike and revolutionary policy, who protested against the treaties of 1815, you would not find in the present Chambers a group, or even individual members, who have taken *revanche* as their platform. Of course, there is a deep, a general feeling of dissatisfaction in the French nation on the subject of the provisions of the Treaty of Frankfort, which deprived France of Alsace-Lorraine; but there is no war party in the Chamber. The Deroulèdes are not representatives of the nation. General Boulanger, who may be said to be the military representative of a war policy, entered the Cabinet for a time merely as a soldier, as seventeen other generals have been ministers of war since 1870; and as soon as he became too active and too imprudent, the Chamber took the first opportunity it found to get rid of him.

Is it not singular that, with our electoral system founded on universal suffrage, with a liberty of the press which has no bounds, the war partisans have not been able to carry a single college in the country? Does not such a fact indicate clearly the temper of the country? France has not forgotten Alsace-Lorraine, and how could she do so? But France received a severe lesson in 1870, and is not willing to incur without necessity the dangers of war. An unsuccessful war would leave France even more diminished, and it would perhaps deprive her of the remainder of Lorraine and some other provinces which were once under the sway of the Duke of Burgundy. It has sometimes pleased the German Chancellor to represent the Republicans of France as more pacific than the Royalists; but there are 180 Royalist Deputies in the Chamber. When can it be said that they have espoused a war policy, or showed themselves more anxious than the Republicans to resist the legitimate wishes of Germany? What may be said is, that under the present Constitution the President would find it very difficult, if not impossible, to make treaties of alliances. Article 30 of the Constitution of July 15, 1875, says, it is true, "The President of the Republic negotiates and ratifies treaties. He makes them known to the Chambers as soon as the interest and safety of the State permit." But Article 31 says, "The President of the Republic cannot declare war without the previous consent of the two Chambers." It is obvious that this last article will always cause great hesitation in a sovereign desirous to treat with our President. This sovereign would bind himself, and the President cannot be bound. If there is no positive treaty between Russia and France, is there at least what we call an *entente*, an understanding, a prevision of eventualities and of a common action? There is nothing of the kind; and no statesman would undertake to define the articles of this future action.

The point which is really interesting at the present moment is this: What is Russia going to do in Bulgaria, and what will Germany allow her to do? The declarations of Prince Bismarck on this point are not quite as clear as one would desire. After having said that he would no longer sue for love, in Russia or in France, he adds that he is ready to respect fully the rights conferred on them by treaty. He admits now, as he did at the time of the Treaty of Berlin, that a preponderating influence ought to devolve on Russia in Bulgaria. But how is this influence to be exercised? Russia has had fair play in Bulgaria. She had a Prince allied to her imperial family, she had the War Minister, she had a great proportion of the officers of the army. With all these advantages, she did not secure her interests, she turned out Prince Alexander, she alienated a part at least of the Bulgarians. Still, Russia is willing to help her in the vindication of the rights conferred on her by the Treaty of Berlin. "If Russia," said the Chancellor, "makes official application to us to support steps for the reëstablishment of the situation in Bulgaria as it was created by the Congress, by recommitting it to the Sultan as suzerain, I shall have no hesitation in advising his Majesty the Emperor to comply with the request." This would mean a Turkish occupation of Bulgaria, and nothing else; it does not mean a Russian occupation. What would Germany do if the Emperor of Russia, with the consent of the Sultan, should enter Bulgaria with his armies, either by sea, by way of Varna, or by land, through Rumania, who could not well refuse the passage? What would Germany advise Austria to do? Would she consider a war between Austria and Russia, if it did not take place in the Austrian provinces, as a *casus fœderis*? We are not allowed to answer clearly all these questions.

What unfortunately seems clear is, that Russia will do *something*. The Emperor of this great country will not quietly accept the situation which is made for him; he will not remain in Europe as the protégé of the German Emperor. He is all-powerful, he has a devoted people, he cannot always remain deaf to the incitements of the Panslavists. He may, without France, enter into a great contest with his powerful neighbors, in the hope that France will perforce be drawn into it.

On the whole, the pacific speech of Prince Bismarck is very disquieting.

BULGARIA.—I.

HEIDELBERG, February 9, 1888.

AT a moment when a European war, of which the Bulgarian situation is one of the principal causes, is threatening, it is worth while to look back to the stirring period when Bulgaria was ruled by the nephew of a Russian

Emperor, and to see whether we are better able to-day to account for the astonishing behavior of Russia towards the hero of Slivnitza than we were on the 7th of September, 1886, when Prince Alexander bade farewell to his people.

The Rev. Adolf Koch's 'Fürst Alexander von Bulgarien' (Darmstadt, 1887) gave us a thoroughly honest and truthful account, in a terse and unpretending style, of all the events as they appeared to the Prince and his companions. We parted from that pleasant book with the feeling that the bomb which put an end to Alexander II.'s life did as much harm to Bulgaria as to Russia. We know that the Emperor was on the point of creating a deliberative assembly, to be elected by the Zemstvos or boards of local government, and we instinctively feel that this step would have conducted Russia on the road of reform instead of on the war-path. We know with equal certainty that he placed such implicit confidence in his nephew, Prince Alexander of Battenberg, and that he so sincerely desired the welfare of the Bulgarians, that he would never have allowed the series of shameful proceedings which terminated in the kidnapping of the Prince. It is hardly going too far, therefore, to say that if war breaks out now between the Powers of Europe, the Nihilists, who brought Alexander III. on the throne, are in truth responsible for it.

From Koch's book we could gather that the Prince attributed his failure to the evil machinations of the Russian officers and civilians in Bulgaria. Prince Dondukoff-Korsakoff is charged with having intentionally drawn up the constitution for the purpose of making it impossible for the German Prince to govern the country. Ultra-radicalism was promoted and encouraged by humble instruments of a despotic government, in order to prevent a constitutional system from striking root and giving Bulgaria an independent existence. The Russian Minister of War, Milyutin, is accused of having thwarted Alexander II.'s good intentions by instructing his subordinates to undermine the Prince's position. The Prince perceives (p. 71) at the bottom of all cabals of the opposition a set of Russian intriguers, who try to sow discord between him and Russia—to the detriment of their own country. Alexander III.'s favor was withdrawn from his cousin in consequence of Hitrovo, Soboleff, and Alexander Kaulbars misrepresenting the motives of Bulgaria's decision to construct the railway from Tzaribrod to Vakarel, connecting Turkey with Western Europe, instead of a line connecting the Danube with the Macedonian frontier. The Emperor was made to believe that Bulgaria was more anxious to build a strategic line for Austria than for Russia. The Prince recognized Gen. Obrutcheff—the head of the Russian General Staff—as a formidable opponent, and fancied having incurred his resentment by the sudden dismissal of the Russian officers of a cavalry regiment (p. 103). He was also sharp enough to perceive that the Russian Consul-General Kumany was not disinterested in claiming a railway concession for the Russian firm Polyakoff (p. 56). But it is the merit of a pamphlet which has lately appeared at Paris * to have given us a clue connecting all these incidents, and explaining to us how the Russians, and they alone, have destroyed what they still call their legitimate influence in Bulgaria.

Though the writer does not give his name, it will be apparent to all persons conversant with Bulgarian affairs that he has read very important documents, and knows how to appreciate the character of the Bulgarians and Russians who have been prominent in the affairs of the principality. We are all acquainted with the extent of jobbery in Russia. During the war of 1877, Europe was horrified by disclosures of the infamies perpetrated on the patient Russian soldier by contractors, who paid a grand-duke's debts, and then recouped themselves by supplying the army with shoddy boot-soles and with cartridges filled with bran instead of gunpowder. Some contractors were in fact tried after the war; what became of them we know not, but the general impression is, that they had to be dealt with gently, as they knew too many secrets. As soon as a Prince of Bulgaria was elected, some of these firms determined to obtain a footing in the new State, and no sooner did the Prince land at Varna than MM. Utin and Tcherny presented themselves before him as representatives of the banker Günzburg and the contractor Polyakoff. They were bearers of a number of letters of introduction from influential Russians, and a letter proceeding from the imperial *Chancellerie* warmly recommended both them and their proposals. Without examining their request any further, the Prince promised to lay the matter before his Ministers as soon as his Cabinet was formed, and to pay due attention to the weighty recommendations they had brought. He fulfilled this promise on July 21, 1879, but at once encountered a decided opposition from his Bulgarian Ministers. No wonder it was so, for the Russians wished to establish a national bank with the sole privilege of administering all public moneys, undertaking financial operations relating to commercial or industrial enterprises or mortgages, coining money, establishing savings banks, etc., emitting national loans for public works, railways, bridges, roads, mines, etc. And they claimed the exclusive right to make preparatory studies for a railway from Sofia to Rustchuk!

Little as the Bulgarian Ministers were prepared for office, they possessed the national quality of being very accurate in money matters, and utterly indisposed to allow other people to appropriate the wealth of the country. It was hard that they should have so soon to set themselves against the Power which had liberated them from the Turkish yoke, and that in their very first meeting they should have to refuse a proposal recommended to them by their new Prince; but all they could afford to agree to was to examine the proposal for creating a bank, and to lay before the Chamber the plan for a railway. Russian intriguers at once set to work among the Deputies, and when the Sobranye met, the Ministry was upset. A new Cabinet was formed, in which the two Ministers who had been audacious enough to oppose the Russian contractors were replaced by new men, one of them, Archbishop Klement, a man of proved venality. When the fall of the Ministry was announced to the Chamber, M. Utin's voice was distinctly heard to say from the stranger's gallery, "At last we shall have a ministry with which it will be possible to do business." The press having taken this up, M. Utin went to the Russian Consul-General and complained. But M. Davidoff happened to be an honest man and a gentleman, so he sent him away with the words, "If you don't like to have the papers write against you, don't meddle in Bulgarian politics." Soon after, this respectable functionary, who was well thought of at the Foreign Office, and especially esteemed by the Empress, was transferred to another post by the influence of the Ring.

Of this Ring the writer declares that its members are to be found in all grades of the Russian social hierarchy, among civil and military officials, in the Emperor's suite, and among subaltern functionaries. He shows us how, as a rule, they managed to fill all the important posts reserved to Russians, viz., the post of Consul-General at Sofia, of Minister of War, of Military Counsellor of the Prince, from their own set. If other men were appointed, the Ring either forced them to adopt its cause or successfully intrigued against them, till they were transferred to some other post. Even independently of the Ring, the position of a Russian diplomat in Bulgaria was a difficult and thorny one; for besides receiving orders from the Foreign Office at St. Petersburg, he had to take into account the special wishes of the Emperor, transmitted to him from the Court, and lastly he could not afford to neglect counsels proceeding from the Slavophil committees, at M. Katkoff's bidding.

The Ring succeeded in securing the services of the four next diplomatic agents of Russia, Kumany, Hitrovo, Yonin, and Koyander, and in this way it counterbalanced the check it received in the dismissal of Gen. Parentzoff and Col. Shepeleff, who had behaved shamelessly towards Bulgaria and its Prince, and had, as far as it was in their power to do so, abetted the contractors who wished to spoliate the country. A thoroughly honest man, Gen. Ernroth, a native of Finland, succeeded to the post of Minister of War April 14, 1880, but unfortunately he gave it up again on July 13, 1881, probably because he did not like having to be in constant antagonism to the official representatives of his country.

The events which led to Prince Alexander's demand of full powers for seven years (May 23, 1881), to the people's approval of this demand, to the temporary suspension of the Constitution (July 13, 1881), and finally to its re-establishment (September 19, 1883) are all connected with the intrigues of the Ring to obtain the concession either for a national bank or at least for the construction of railways. MM. Utin and Tcherny insisted upon receiving the concession for a bank from the Government, with the restriction, of course, that the contract should be ratified later on by the Assembly; and the Klement Ministry feeling that they could not go further than to submit the Russian proposals to the Chamber, which would be sure to reject them, M. Kumany withdrew his support from the Government, and allowed the Ring to come to terms with the Opposition under Zankoff and Karaveloff. The latter unprincipled statesman accepted 200,000 francs from the Ring for electioneering purposes, and, thanks to a clever application of these ill-gotten funds, the new elections placed the Conservatives in a minority, and brought Zankoff and Karaveloff into office (April 7, 1880). They at once sent M. Hogdé out of the country to prevent this able official, whom the French Government had expressly placed at the Prince's disposal, from giving an unfavorable opinion concerning the merits of the bank scheme. But all their intrigues failed to induce the Chamber to abandon the Bulgarian principle of strict economy, and to hand over the resources of the country to foreigners. The Assembly returned the proposals to the Government, to be reconsidered. Well aware that the scheme could not bear scrutiny, the Ring resigned itself to a temporary postponement, and considered whether the railway scheme was easier to push through. They brought all their influence to bear on the Prince, representing how Austria would soon insist upon Bulgaria's constructing the line from Vakarel to Tzaribrod, contemplated in the Berlin Treaty and destined to connect Turkey with Central Europe, and how it was of the utmost im-

* 'Les Causes occultes de la question bulgare.' Paul Ollendorff. 1887.

portance for Russia to have a line connecting the Danube with Sofia, so that Russian troops might advance upon the capital as fast as an Austrian army. The Prince, who acknowledged the legitimacy of Russia's preëminence in Bulgaria, and knew perfectly well that he owed his crown to his uncle, gave in, and M. Zankoff was allowed to recommend the construction of railways to the Assembly (October 27, 1880). The deputies adopted a line from Sofia to Rustchuk in principle, but they were wise enough to request the Government to undertake the preparatory work itself and then to bring in a bill on the subject at the coming session. THEODOR VON BUNSEN.

Correspondence.

RESTRICTIONS ON THE POWER OF DISMISSAL.

TO THE EDITOR OF THE NATION:

SIR: In your issue of February 9, referring to the President's refusal to endorse the proposed rule requiring heads of offices in the civil service to file a written statement of the cause in every case of dismissal of subordinates, you say:

"We are aware that not a few civil-service reformers have always favored a regulation of this sort, and there is something to be said in its favor, but the arguments on the other side appear to us much the stronger. It constantly happens in private business that an employer thinks it wise to discharge a man because he is not entirely satisfied with the manner in which he does his work, although it would often seem too harsh to charge the delinquent publicly with neglect of duty. The same thing is always liable to happen in a public office. The civil service cannot be conducted efficiently if there must be a public trial every time that the head of an office thinks it wise to dismiss a subordinate. The competitive system renders it impossible to smuggle a man into a vacancy, and thus removes the only really dangerous motive for making a vacancy. With admission to the service thus guarded, the length of retention may be left safely to the discretion of the appointing power."

Will you allow me to express a difference of opinion with you on this point? I ask the favor with some hesitation, because I recognize the *Nation* as an authority on civil-service reform, and three years ago I should have agreed with you entirely even in this particular. At that time the new law had produced markedly good results. Here in Philadelphia, for instance, the Post-office had been taken wholly out of "politics," and Independent or Democratic election circulars could go safely through the mails. It was generally believed that the reform would be not only permanent but progressive, but the strain of a change of party in the Administration had not come yet. That change came, and while, owing to the growing reform spirit and lessening partisanship of the people, the strain was not what it might have been, it was enough to develop many unsuspected weak spots in the new system, and to show that a civil service which has been notoriously and systematically partisan for over half a century needs more stringent rules than may be required in that ideal *national* civil service which we must still struggle and hope for.

With what you say of the inexpediency of a public trial I cordially agree, but a mere statement of reasons would not lead to a trial (except perhaps a "trial by newspaper," the edge of which would be dulled by the partisan motive) so long as the superior kept within the bounds prescribed by the law of libel. Even admitting, however, that there were cause for an argument *ab inconvenienti*, I would suggest that, in view of the present condition of our civil service, there is more need to prevent improper dismissals than to facilitate proper ones; that while great freedom of action could be left to heads of offices had they no partisan motives for making dismissals, this is not yet the case. You say, however, that the law has taken away such motives. Now, undoubtedly, if the examinations are fair, "the competitive system renders it impossible to smuggle a man into a vacancy," *i. e.*, no one particular man can be given a place irrespective of fitness, but each must take his chance with the other applicants; yet this does not in the least prevent a deliberate change of the *personnel* of an office, collectively, from the members of one party to those of another.

In a letter which you kindly printed in your issue of December 9, 1887, I stated how such partisan change could be, and apparently was, effected, and I shall take the liberty of restating it. A systematic dismissal of all the Republicans, for instance, in an office takes place, with the result that a great number of vacancies must be filled. Even if the "sweep" be not made so rapidly as to disorganize the working of the office (a result not wholly unknown), it is "clean" enough to show Republicans that they are not wanted, and are not likely to be retained, should the head of the office be compelled, under the rules, to appoint them. The result is that scarcely any Republicans will apply for an examination that does not promise them, if they pass it, a fair chance of permanent employment, and the appointing officer is left free to fill with those of his own party the places he has made for them.

If this be true (and the administration of the Philadelphia Post-office seems to prove it); if admission to the service is not so well guarded by the Civil-Service Law as was anticipated, more stringent rules appear necessary, and what better rule has been suggested than that proposed by the only members of the Commission that one can call reformers? When the change now taking place in public opinion, in regard to "politics" in the civil service, has gone so far that the head of an office would not dare to act in the manner described, the rule will no longer be necessary. The question is, is it not needed *now?*

The unrestricted power of dismissal has a further result. If the head of an office be known to be a partisan, his subordinates must necessarily become such also. They will not be even nominal Democrats or Republicans if independence be followed by dismissal; and whenever party interests are at stake, they will be as active with their "voluntary" contributions and political work as if the Civil-Service Law did not exist. I do not say that this is universally so, but that it is so to an alarming extent—that the carrier who brings my mail says frankly that he is employed *because* he is a Democrat, and that his predecessor was discharged *because* he was a Republican. This would look as if the only practical result of the Civil-Service Act had been to raise the personal standard for admission to the public service without affecting its partisan character.

PHILADELPHIA, February 18, 1888.

IOWA RAILWAYS.

TO THE EDITOR OF THE NATION:

SIR: The spirit of Grangerism which so seriously affected several of the States of the Northwest in 1873 and 1874, stamping its character upon their legislation, and giving a name to their railways by which they have ever since been known, after a sleep of a dozen years, has again made its appearance in the State of Iowa in a very virulent form, and threatens, for the time being, the destruction of all railroad property in the State.

At the election last fall both parties, forgetful of the comparatively sparse population and limited business of the State, adopted very radical platforms on the subject of regulating railroads, declaring, among other things, in favor of a two-cent passenger rate per mile in all cases, and the lowest rate on freight existing anywhere in the United States.

Gov. Larrabee, the special friend and representative in that State of the interests of Mr. Allison, who, it is believed, expects to succeed him, should he be elevated to the Presidency, and who had been elected two years before as a conservative politician, friendly to railroads, was renominated on this platform and made a vigorous canvass on this question, and in his message to the Legislature and inaugural address strongly advocated the adoption of a two-cent fare bill and great reductions in freight rates.

The Senators and Representatives appeared eager for the work, and a great number of bills have been introduced in both houses upon the subject, proposing legislation which, if adopted, enforced, and continued, will render many of the railroads of the State practically worthless, and very seriously impair the value of all the rest.

It is said that the Railroad Commission, one of the most practical and conservative, composed of one Democrat and two Republicans, do not approve of said party platforms or proposed legislative action, and in their report to the Governor opposed any reduction of freight or passenger tariffs by the Legislature, and recommended that no radical measures on the subject of railroads should be adopted. Although this report was made several weeks since, it has not been communicated by the Governor to the Senate or Assembly, and is apparently purposely suppressed while the Legislature is acting upon this subject.

The Governor has appeared personally as an advocate before the Senate Committee, vehemently urging the passage of the Two-Cent Passenger Bill and other similar legislation, and the present indications are that these radical measures will be adopted by the Legislature, and thereby the railroad property of the State, which has cost over $350,000,000, will be seriously injured, and much of it, for the time being at least, practically destroyed, so far as earning any compensation for its owners is concerned.

These proceedings are a forcible and instructive, though not pleasant, commentary on the workings of our republican institutions under the decisions of our highest court.

It is claimed that, according to the judgment of the Supreme Court of the United States in the Granger cases, the Legislatures of the several States have full and complete control of fixing the compensation of railways both for freight and passenger traffic, and there is no remedy for any injustice committed except by an appeal to the voters at the polls.

This doctrine is a complete abdication by the courts of all power to protect this species of property, and an unconditional surrender thereof to the tender mercies of politicians and adventurers who may desire to prey upon it.

The Constitution of the United States provides (section 1, article 14) that "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty or property

without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws."

No one pretends that the passage of an act by the Legislature depriving a person or corporation of its property is due process of law, but it is perfectly manifest to every one that the passage and enforcement of an act reducing the passenger and freight rates of all railroads in the State of Iowa one-third will, so long as it remains in force, reduce the value of all railroad property in the State, so far as its capacity to earn a revenue for its owners is concerned, at least one-half, as the expense of operation is not reduced, but the whole reduction is from the net.

In other words, if the proposed legislation is to take effect and remain the permanent policy of the State, the value of railroad property would be decreased thereby at least one-half, or $175,000,000. Therefore the enactment of that legislation and its continuance as the permanent policy of the State will deprive the owners of those roads of that amount of their property, and that without process of law. Yet the Supreme Court of the United States, by their judgment, declare that the passage and enforcement of such legislation is not a violation of this provision of the Constitution; that the taking of this amount of railway property from its owners, by the passage and enforcement of such a law, is not depriving them of their property, and that there is no protection for them under the Constitution, but their only remedy is at the polls.

It is difficult to understand the philosophy or reasoning of such a decision upon such premises. To illustrate: A railway company in Iowa owns a railroad upon which it is now charging three cents per mile passenger fare and the freight rates now in force, both of which are as low as the charges in any of the adjoining States, and are lawful and reasonable rates. At those rates the road pays 6 per cent. on $30,000 per mile, which is its fair and reasonable cost. It may therefore be said to be worth $30,000 per mile. If the rates are changed, as provided in the proposed legislation, by a reduction of one-third, the road will only pay 6 per cent. on $10,000 per mile, perhaps not that. Is it not evident, therefore, that the enactment and enforcement of the proposed law will deprive the owners of that property of real and substantial value to the extent of $20,000 per mile of said road? Is it true, then, as stated by the Supreme Court of the United States, practically, by their decision, that the passage and enforcement of such a law is not in violation of the Constitution of the United States? Will it not deprive the owners of the railroad of two-thirds of the actual value of their property?

There are in the United States about 135,000 miles of railroad, which have cost over $7,500,000,000, and the funded debt secured on said railroads amounts to nearly if not quite $4,000,000,000. Is it true that this vast interest is outside the pale of the Federal Constitution, and have its owners no protection against the folly, passion, and political platforms of the several States within which it is situated? The fact that the courts will prevent the forcible dispossession of the owners is of no consequence, if the Legislature can, by legislation fixing its compensation, render the property worthless.

It is respectfully submitted that such is not the correct interpretation of that instrument. In this country the legislative power is not omnipotent; it is controlled by the constitutions, both State and Federal, and its domain is confined to the proper field of legislation, and does not extend to the entering of decrees depriving persons of their property, either by wresting it from them bodily, or by rendering it worthless.

It is not denied that the Legislatures of the several States may regulate the railroads therein, and provide that they shall properly serve the public and charge only reasonable and just rates of compensation therefor, and may enact suitable legislation for that purpose; but the question of what is reasonable and proper service and a just compensation is a question to be determined, as other disputed questions of law and fact are determined, by the courts, and not by the arbitrary decree of a Legislature.

It is submitted that this subject has not received at the hands of the Supreme Court that careful, calm, and proper consideration which its importance demands. It was before the court in the famous Granger cases, was argued at length, and took much time of the court, but it was unwisely and erroneously claimed by the railroads in those cases that the Legislature had no power to interfere with or regulate the compensation of railroads, and almost the whole attention of the counsel and the court was directed to that point. In proof of this I quote the language of Mr. Justice Miller, in the case of Wabash, etc., against Illinois, 118, United States Reports, in which he in part reversed the judgment in the Granger cases. Referring to said causes more than ten years afterwards, he says:

"The main question in all the cases being the right of the State to establish any limitation upon the power of the railroad companies to fix the price at which they could carry passengers and freight, it was strenuously denied, and very confidently, by all the railroad companies, that any legislative body whatever had a right to limit the tolls and charges to be made by the carrying companies for transportation; *and the great question to be decided, and which was decided, and which was argued in all those cases, was the right of the State within which a railroad company did business, to regulate or limit the amount of any of these traffic charges. The importance of that question overshadowed all others.*"

It is manifest, therefore, that while the railroads in the Granger cases were claiming complete exemption from legislative control, and insisting upon that, the court in their decision went to the other extreme, and held that the Legislature had power to prescribe arbitrary rates by fixing a maximum tariff, which was the law then before them. This decision was by a divided court, Justices Field and Strong dissenting; their dissent not holding that the railroad companies were right in their contention of exemption from all legislative control, but that they might be regulated by proper rules and legislation upon that subject, but not by fixing a maximum rate. The true rule is that suggested by them, that the Legislature has power to regulate railroads and provide that they shall not charge more than a just and reasonable compensation, and that they may provide adequate and necessary means and facilities for ascertaining and determining that reasonable compensation. The determination and decision of what that reasonable and just compensation is, must be by the judgment of the courts after a hearing of the parties, as in all other contested matters. In this way alone can the rights of the people and of the railways be properly ascertained, fixed, and determined; and until the Supreme Court revises and reverses its decision in the granger cases in this particular, there will be no security or stability to railway property or the securities representing it.

To give every unfledged legislator the right to fix the compensation and prescribe the management and policy of the railroads of the country, is too grotesque an absurdity to be tolerated in any civilized community.

JOHN W. CARY.

MILWAUKEE, February 23, 1888.

EXTRADITION.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of February 16 you remark that "in the meantime the rejection of the treaty permits the continuance of that great disgrace to the American name—the steady growth of the American colony of bank defaulters in Canada." Let me remind you that there is in the United States a Canadian colony of bank defaulters, embezzlers, and criminals of other classes, and that these scoundrels on both sides of the line are laughing in their sleeves at the folly of the two nations that play into their hands. Why should you persist in refusing to surrender our criminals for trial, and why should we persist in giving an asylum to yours? Why can each nation not surrender to the other such criminals as it may be thought worth while to ask for?

There's no need of a treaty to enable them to do this. The Legislature of Canada can empower the Government of Canada to surrender all criminals except those charged with political offences, and I presume that similar authorization can be given by legislature to executive with you. An extradition treaty, so far from being a benefit, is a hindrance, as it furnishes opportunities for raising technical points like that on which Eno escaped extradition. If one nation were to begin this practice of surrendering criminals, the other would certainly reciprocate; but what if it did not? Surely it would be good policy on our part to let you have all your own criminals, even if we get none of ours in return. What we want them for is to punish them, with a view to deterring others from crime, and though in many instances punishment undoubtedly has a good effect, exile certainly is quite as potent in others.

I do not urge the voluntary surrender of criminals merely on the ground of international comity, or on that of obligation imposed by a "natural law." Much of what is said in this connection is perilously near to jargon. I urge the expediency of the practice rather on the ground that it is good policy for each country to get rid of both its own and its neighbors' criminals if it can. The ordinary view, that we should not surrender your criminals unless you give up ours, is based on an utterly absurd and indefensible theory of "asylum."

WM. HOUSTON.

TORONTO, February 24, 1888.

PROTECTION AGAINST SMUGGLING.

TO THE EDITOR OF THE NATION:

SIR: In this morning's *Strassburger Post* is a communication, concerning smuggling on the French frontier, from which I translate the following interesting extracts:

"A few days ago the customs officials at Diedolshausen . . . captured 19 barrels of alcohol which were being smuggled from Fraize to Diedolshausen. . . . The alcohol was conveyed to the custom-house, where it awaits sale at auction. But upon the 15 barrels, the owners of which were not caught, the import duty of M. 1.80 per litre must first be paid. If, as is to be foreseen, the bids do not cover this amount, then, as was done in a similar case a short time ago, the heads of the barrels will be knocked in and the alcohol intrusted to the neighboring creek for further transportation. Otherwise the home manufacturers would be injured, and would have a right to enter complaint against the customs officials for selling alcohol cheaper than they. The 4 other barrels, upon which the owner was required to pay five

times the import duty, will be sold for what they will bring."

So the alcohol upon which the smuggler paid the duty may be sold cheaper without injuring the home manufacturer! On this principle, why cannot the officials sell all 19 barrels cheaper, seeing the smuggler had to pay five-fold on 4 barrels, which would more than cover the duty on the 19 barrels?

And are we to suppose that in the next war with France Germany will destroy the cannon she captures, lest she injure the business of the Krupp manufactory? GEORGE HEMPL.

STRASSBURG, February 9, 1888.

PROTECTION, OR PLUTOCRACY?

TO THE EDITOR OF THE NATION:

SIR: Much as I desire tariff reform, it does not seem to me that the "American colony in Europe" furnishes a case in point. Argument from those facts savors too much of the protectionist method of claiming all the prosperity of this generation for the one thing, duties on imports.

It has been my observation that one could live as cheaply in almost any American city as in the European, provided he would take the same position towards society at home that he does abroad. In Europe, where he is little acquainted, he can escape the necessity of a large establishment and the expensive pressure of social requirements. If he chooses to live in a *pension*, or keep one servant and invite sparingly, he can do so without incurring social obloquy. In the case of those who do make a "spread," the difference in prices simmers itself down principally to the matter of servants and wages.

After eliminating the other reasons for staying abroad, such as the advantages of art, music, or climate, it seemed to me that persons were living there more or less permanently because they could do so more quietly, and wished to escape that false social standard, too prevalent among us, which rates a man according to his expenses instead of his moral worth. Plutocracy, rather than protection, has driven them to foreign parts. J. M. V.

BALTIMORE, February 25, 1888.

COAL ON THE PACIFIC COAST.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* of February 9 contains an article on the coal tariff which reaches the conclusion that "American coal producers would suffer nothing" by the removal of the duty. This statement is based on the assertions that "there is no foreign coal which could come into competition with American coal anyway," and that "very little coal would be imported if the duty were repealed." While these statements are doubtless true of the Atlantic seaboard, they are not substantiated by the condition of the coal traffic on the Pacific. The British Columbia coal is as superior to the American product as the Nova Scotia coal is inferior. Further, the mines of Washington Territory are not so cheaply worked, and are not so close to the sea, as the neighboring mines in British Columbia. The duty on coal is therefore essential to the prosperity of the coal interests of Washington Territory. These interests are not unworthy of attention. Their value, as estimated by the Legislative Committee on Mines, is upward of $13,000,000. The output of the nine leading mines for 1887 was 690,212 tons, and the total output for 1888 is estimated at nearly a million tons.

I do not mean to imply that the Washington Territory coal companies are entitled to protection at the expense of the rest of the country, but I do wish to suggest that the *Nation's* conclusion that "the duty on coal is maintained because it is of no use," is defective.

Respectfully, S. A. E.

SEATTLE, W. T., February 20, 1888.

[The "conclusion" that we drew was from "assertions" made by the agent of a railroad and mining company in opposition to repeal of the duty.—ED. NATION.]

MR. BLAINE ON AMERICAN "CHEAP LABOR."

TO THE EDITOR OF THE NATION:

SIR: In looking through some of the consular reports issued by the Department of State, I found in No. 12, published in 1881, and relating to the "Cotton Goods Trade of the World," the following passage:

"From these returns [referring to certain English official reports] it is seen that every American spindle consumes sixty-six pounds of raw cotton, while each British spindle consumes only thirty-two pounds, or less than one-half the American consumption per spindle."

"It thus appears that each American operative works up as much raw material as two British operatives, turns out nearly $1.50 worth of manufactures to the British operative's $1.00 worth, and even in piece goods, where the superior quality and weight of the American goods are so marked, the American operative turned out 2.75 yards to 2.50 yards by the British operative."

This passage occurs in the introductory letter of transmission, and is signed "James G. Blaine." Since it is down in the same report that in America the wages paid in the cotton industries only slightly exceed those paid in England, is not this pretty good evidence from the pen of the protectionist leader that American labor is cheaper than English when measured by the unit of production?

W. S. A.

BOSTON, MASS., February 23, 1888.

A MALIGNED TERRITORY.

TO THE EDITOR OF THE NATION:

SIR: So much has appeared in the newspapers of the country concerning the great storm of January last, which swept with such fury the whole Northwest, that the readers of the *Nation*, as well as every one else, are no doubt heartily tired of the subject. But in many, if not most, instances the truth has been so covered up with falsehood, exaggeration, and misrepresentation that it has entirely disappeared. The result has been to create a false impression in the minds of those unacquainted with this section, and especially is this true as to Dakota.

Because I believe the *Nation* is read by a greater number of reasoning persons than any other journal of its character, I shall be very thankful if you will give space in your valuable paper to a few words concerning this matter, which may tend to a better understanding of the facts.

The number of persons who perished has been by some placed at several hundred, while others have not stopped short of a thousand. No attempt has been made to conceal the facts, as has been charged in some quarters by persons whose interests are hostile to those of the residents of Dakota; on the contrary, every effort has been made by the press and by others to ascertain the name of every person who met his death in the "blizzard." The list is now complete, and shows the number to be one hundred and thirteen.

While the truth is appalling, yet when it is considered that the area covered by this report is 150,000 square miles, or equal to the combined area of all of New England, New York, and Pennsylvania; that practically the whole of this great country is without fences, and, as a rule, sparsely settled, the greatest wonder is that the mortality is so small.

Three things should be borne in mind: (1.) That the storm came at a time of day when many were absent from home, and the children were at school—without a moment's warning, out of a clear sky, on a thawing day; and in five minutes the mass of whirling snow was so dense as to blind the eyes to the nearest objects. (2.) That no such storm was ever before known in the Territory. (3.) That the total unfamiliarity of the inhabitants with the terrors of a "blizzard" was the immediate cause of death in almost every instance, for not to exceed one in a thousand had ever witnessed a storm of this character, and many ventured out and were lost who might have remained safe within doors.

These are the facts. If another storm of equal severity should rage to-morrow, I venture the opinion that not a human being would perish.—Thanking you, I remain truly yours,

EDWARD A. MORSE.

HURON, DAKOTA, February 20, 1888.

Notes.

THE eagerly expected new volume of poems by James Russell Lowell, 'Heart's-ease and Rue,' will be published early in March by Houghton, Mifflin & Co., who also announce a novel by Mrs. Margaret Deland, the poetess of 'The Old Garden'; 'Reincarnation,' by E. D. Walker; and 'Current Religious Perils,' being the eleventh volume of Joseph Cook's Monday lectures.

Cupples & Hurd, Boston, will publish directly two genealogical works, one being the sixth edition of Whitmore's 'Ancestral Tablets,' in an improved form, the other, 'How to Write the History of a Family,' by W. P. W. Phillimore, M.A.; also a work on mental healing, 'What shall make us Whole?' and 'Thomas Carlyle's Counsels to a Literary Aspirant and What Came of Them,' a letter of 1842.

'Historic Waterways,' six hundred miles of canoeing on Wisconsin rivers, by Reuben G. Thwaites, Secretary of the State Historical Society, is in the press of A. C. McClurg & Co., Chicago.

On March 25 the New York Shakspere Society will issue the first volume of 'The Bankside Shakspere,' a separate reprint of each play, with the First Quarto text paralleled with the First Folio, and both texts numbered line by line. Five hundred copies only will be printed, and should be applied for (per series, not per volume) to Mr. L. L. Lawrence, Newtown, Queens Co., N. Y., or to Trübner & Co., London.

Thomas Whitaker will be the American publisher of a 'Dictionary of Anecdote, Incident, Illustrative Fact,' gathered from pulpit and platform, and copiously indexed.

A series of recollections, 'At Home and in War,' by Col. A. V. Verestchagin, who participated in the Turkish campaign of 1878 and in the Turkoman campaign, has been translated by Miss Isabel F. Hapgood, and will be published with portrait illustrations by T. Y. Crowell & Co.

Reference has been already made in our columns to the fact that the University of Leipsic has engaged to receive and to preserve, for purposes of scientific study and historical re-

search, all books, pamphlets, or other publications relating to the development of religious ideas and institutions in the United States, under their various forms of manifestation in our religious denominations of every kind. We are now authorized to state that the Smithsonian Institution, through its system of international exchanges, will undertake the transmission of all works having this destination, if forwarded to Washington without charge to the Institution.

Some notable new foreign works are the 'Monuments of Greek and Roman Sculpture,' historically arranged under the direction of Heinrich Brunn, edited by Friedrich Bruckmann, illustrated by permanent phototypes from the originals, and to appear in eighty parts at one pound each (London: Asher & Co.); an 'Englisches Namen-Lexikon,' a pronouncing biographical dictionary (Berlin: Haude & Spener; New York: Westermann); and a popular reprint, by permission, of the royal edition of the St. Talice commentary on the 'Divine Comedy' issued in 1885, with the addition of a copperplate engraving of a hitherto unknown portrait of Dante, asserted to be the best (Milan: Ulrich Hoepli; New York: Westermann).

The 'Annual Index to Periodicals,' for the year 1887, which ranks fifth in the series of so-called "Cumulative Indexes," comes to us from the untiring compiler (Bangor, Me.: W. M. Griswold). It is now, by elimination, an almost purely American index, but still includes the *Revue Coloniale*, *Revue de Belgique*, and *Revue Historique*.

A very remarkable collection of marine views is brought together in the fifty heliotype plates of 'American and English Yachts' (Chas. Scribner's Sons). They were all taken from nature, by Mr. N. L. Stebbins, and fairly represent the progress of yacht-building in the Victorian era, at least from 1851 to the present time. One finds both the *Volunteer* and the latest edition of the *America*, and the most famous American and British-built craft, including among the latter several (like the *Irex*) never seen in our waters. Even catboats are admitted along with sloops and schooners, and at the end are placed our finest steam yachts, the *Alva*, the *Atalanta*, etc., and those wonderfully swift Herreshoff productions, the *Stiletto* and the *Now Then*. Particulars as to maker, owner, dimensions, and racing record are annexed to each plate. Mr. Edward Burgess furnishes a characteristically modest introductory sketch of the rise of yachting, and of the causes which have determined the development in building on both sides of the Atlantic. The handsome and solid oblong volume has a permanent value for study and reference.

Part III of the 'Anglo-Saxon Dictionary' published by the University of Oxford has appeared. This is the Bosworth or Bosworth-Toller dictionary, based on the manuscript collections of Dr. Bosworth, but edited and enlarged by Professor Toller. Dr. Bosworth was born in 1789, and he skirmished about in Hebrew, Arabic, Latin, Greek, and such things at first, so that he did not fairly settle down to Anglo-Saxon till his middle life. His dictionary was published first in 1838. He was many years making collections for this new edition, and had nearly completed the first part when he died, in 1876. He deserves much for the time and money which he devoted to Anglo-Saxon. He founded the chair of Anglo-Saxon at Cambridge. But his scholarship belongs to the period prior to scientific phonology, and his dictionary work seems deplorable to the new philologists. This part (Hwi-Sar) is the work of Professor Toller, and very good work it is. He has gleaned the latest vocabularies and critical studies, and brought together a rich collection of illustrative quotations from the whole field of printed Anglo-Saxon, with references not only precise, but duplicated very often for different editions of the original. It will be most welcome to all students of the grandmother tongue.

Mr. Morley's address before the Edinburgh Philosophical Institution, last November, upon 'Aphorisms' has been reprinted in a handy form (Macmillan & Co.). It is a subject which the author is especially fitted to treat, both by his natural taste and his familiarity with the French examples of this branch of literature, and he makes a very good review of the principal writers of pregnant sayings. He thinks that the best part of literature is that which sums up such wisdom about life, and certainly it is, so far as matter is concerned; but perhaps no form of literature so easily degenerates into mere point, or accustoms the mind to rest in half-truths, or imposes a sounding platitude so often in the place of real ideas. With such a guide as Mr. Morley to pick out the best and truest things, all goes very well; but literary aphorisms are not, like proverbs, stamped and current with the acceptance of all men, and the young reader may do better than get his philosophy of life from these "makers of thoughts," whose absence in our literature is often deplored more loudly than the occasion warrants.

'Ireland's Disease: Notes and Impressions,' by Philippe Daryl (Routledge & Sons), is a translation of letters written to *Le Temps* in the summers of 1886 and 1887—a mixture of wheat and chaff, amusing writing, careful and careless observation, reliable and unreliable information. The broader lines of the problem are correctly limned; and, barring particulars, a perusal of the work leaves upon the whole a tolerably correct impression on the mind of the distracted and bewildered condition of Ireland at the present moment.

In a little volume entitled 'The Geological Evidences of Evolution,' published by the author in Philadelphia, Prof. Angelo Heilprin has expanded a lecture delivered at the Academy of Natural Sciences in Philadelphia, and furnished it with clear and satisfactory illustrations. It contains little, if anything, which has not been for some time the common property of biologists, but has the merit of stating in a comprehensible way a few of the reasons why they have recognized in fossil animals of successive strata good evidence of evolutionary processes. The preacher or layman who desires to know something of the facts, and something of the kind of facts which recommend themselves to the naturalist in considering such questions, will do well to read this little book, of which the externals are attractive and the contents reliable and easily understood.

The 'Report on Indian Fibres and Fibrous Substances exhibited at the Colonial and Indian Exhibition, 1886,' issued by E. Spon, a modest volume of seventy pages, is the most important recent contribution to our knowledge of vegetable fibres. It contains in a compact, although not very convenient, form the results of fresh studies in the chemistry, microchemistry, and microscopy of the more useful and promising textile and paper fibres. Two of the authors, Messrs. Cross and Bevan, are well known from their success in the management of refractory fibres; and a colleague, Dr. George Watt, is even more widely known from his energy in collecting and his skill in displaying the vege table products of India in the Exhibition of 1886.

The Indian Survey Department has just published a report of the travels of M—H, a "native explorer," in Nepaul and southern Tibet. He crossed the Himalayas by the Pangula Pass, which he estimated at over 20,000 feet in height. Along the path he noticed, what he did not see elsewhere, large masses of rock "poised like capitals on pillars of frozen snow, about thirty feet or forty feet in circumference, and twenty feet to thirty feet in height." Not being permitted to go to the north or east, he turned to the west, and made his way with much difficulty, the Tibetan officials interposing every possible obstacle to his advance, to Dingri. From this town, situated in a plain, well cultivated, though at a height of 13,860 feet, he went to Jonkhajong, a Tibetan fort, but could go no further, and accordingly returned to India. The chief interest of his journey, which equalled neither in extent nor in the importance of the geographical observations those of Nain Singh or the Pundit A—K, seems to be in the reports of the trade between Nepaul and Tibet and the condition of the country. From his story it would appear that the Tibetan frontier is still guarded with the greatest vigilance to prevent all save authorized visitation.

We are tempted to linger on some topics suggested by 'Canadian Leaves,' a series of papers read before the Canadian Club of this city, and published by Napoléon Thompson & Co. We can, however, do little more than recommend them to any one desirous of studying the condition of the Canadian mind both towards the mother country and towards the United States. The most elaborate paper is Mr. Goldwin Smith's on "The Schism in the Anglo-Saxon Race," a review of the causes and consequences of the American Revolution, with unavoidable reference to the Celtic race and the Home-Rule contest, but with an earnest desire for the mutual perfect understanding of the Union, the Dominion, and Great Britain. Mr. Edward Collins discusses the future of the Dominion, pronouncing in favor of independence, and Principal Grant takes much the same attitude in "Canada First." Congressman Butterworth's "Commercial Union between Canada and the United States," and Mr. Erastus Wiman's discourse to the same effect, are here printed in extenso. Other papers on old Acadian and Canadian history, on the literature of the Dominion, on its mineral resources, its great Northwest, its Pacific Railroad, etc., etc., fill out the handsome pamphlet volume. A portrait of each writer accompanies his paper.

We understand that Mr. T. B. Drew, librarian of the Pilgrim Society at Plymouth, Mass., has uncovered a very important lot of old newspapers, chiefly a collection made by Judge William Cushing of the United States Supreme Court. No fewer than 134 kinds and 5,192 numbers have been brought to light, and those of the *Columbian Centinel* alone make twenty volumes. The earliest papers bear date of 1728. Some account of these rarities may be expected in the *New England Historic-Genealogical Register*.

The volume of Proceedings of the Massachusetts Historical Society just issued is of rather more than usual general interest. Among the noteworthy memoirs of deceased members is the appreciative sketch of Mr. C. C. Perkins by Dr. Samuel Eliot, in which Mr. Perkins's careful preparation for and single-hearted devotion to his lifework, the promotion of the study of art by means of literature, of galleries, and instruction in the public schools, is very clearly shown. While this is naturally chiefly dwelt upon, Mr. Perkins's eminent services in the cause of music are not overlooked. There are also printed several letters of Dr. Joseph Priestley, a selection from the Winslow Papers,

chiefly relating to refugee loyalists, and the "Records of the Old Colony Club," a Plymouth social institution which existed between the years 1769 and 1773. Of greater interest are the Journals of Gen. Henry Dearborn, kept at various times during the Revolutionary war. They give plain and sometimes amusing accounts of camp life, as well as of events in the Burgoyne campaign and a description of the battle of Monmouth. It is rather surprising to find numerous entries of festivities, especially "Desent" dances and "Eligent" balls. Spelling was not the gallant soldier's forte, especially in French names, as witness "Marques Le fiete" and "Count De Asstange." The influence of these allies is shown in the orders which he received to march "back to Reading, toot sweet."

In the *New England Magazine* for February Dr. J. M. Drew presents some documents exculpatory of Ethan Allen and other Vermont Revolutionary leaders from the charge of disloyalty in their negotiations with General Haldimand. These are shown in the light of a ruse —"a necessary political manœuvre to save the frontiers" of the State.

From Moulton, Wenborne & Co., Buffalo, we receive the prospectus of the *Bibliographer and Reference List*, a monthly to be born in May, with the design "to furnish booksellers, public libraries, and individual bookbuyers with a handy help" in the selection of books. It remains to be seen how far it will supersede the bibliography of the *Publishers' Weekly*.

Among the newer magazines we remark *Technology*, a scientific quarterly issued, in good style and with readable contents, by the senior and junior students of the Massachusetts Institute of Technology. The first number appeared in September, 1887.

Bookworm for February contains a first paper by William Blades on the origin of printing, to whose latest views respecting the controversy between Holland and Germany we referred specifically the other day.

"O famoso invento de Guttemberg" are the first words of the new *Mensageiro Litterario* published at Oporto by J. J. de Mesquita Pimentel. Apology is made for the defects of its bibliographical department, and we may well await further issues before describing its character.

We have received from Chas. Scribner's Sons the first two numbers of the year of *Art and Letters*, which is simply *Les Lettres et les Arts* in an English dress, retaining all the embellishments and general typographical luxuriousness of the French edition. We say "simply," but we are well aware how great an undertaking it is to maintain a second parallel issue, even if, as would appear inevitable, the poetry has to be left untranslated. No one who can read French would hesitate which to prefer, but we doubt not that the publishers rightly calculate on a sufficient support from solely English-reading lovers of costly illustrated works. Our own readers are well aware, from constant notices, what is the character of *Les Lettres et les Arts*—a periodical without a rival in kind or in degree; the highest result yet reached of a combination of literary and pictorial art.

There is little that calls for remark in *Le Livre* for February, whose solitary full-page adornment is a curious portrait of Théophile Gautier, etched from a photograph taken in 1856.

The *Revue des Deux Mondes* announces that it will publish during the present year the following novels: "La Vocation du Comte Ghislain," by Victor Cherbuliez, "Un Artiste," by Octave Feuillet, and "Blanches Couronnes," by Ludovic Halévy.

The *Illustrirte Zeitung* for February 11 has two striking maps, the one showing the manner in which the Russian forces are massed on the German and Austrian frontier, the other showing the disposition of the French Army on the German frontier.

Archiv für Soziale Gesetzgebung und Statistik is the title of a new quarterly magazine edited by Dr. Heinrich Braun (Leipsic: H. Laupp; New York: Christern). The first article on the list of those engaged is on the condition of the unemployed in the East End of London. Others relate to Austrian savings-bank legislation, workingmen's homes in Havre, Sunday rest in Germany, to Russian, Swiss, and Belgian topics.

The principal articles in the last number of the Journal of the Royal Statistical Society are the inaugural address of the President, the Hon. G. J. Goschen, on the "Increase of Moderate Incomes," and that of Mr. Robert Giffen before the British Association, "On the Recent Rate of Material Progress in England." Among the other papers is an amusing review of Mr. Mulhall's works by M. de Foville, entitled "The Abuse of Statistics." His conclusion, after an apparently careful examination of the figures relating to France in the 'Dictionary of Statistics,' is, that "errors absolutely swarm." This is translated from a French statistical journal, as is also M. François Bernard's paper "On the World's Wheat Production."

— The *Atlantic* for March opens with an admirable short story of but half-a-dozen pages by Sarah Orne Jewett. It is a character sketch of two women, one poor and one well-to-do, who watch the body of a third according to the old New England custom, and so fall into confidences and talk of the dead woman's charities, and of the different ways of people in giving. The scene, the dialogue, and the memory of the dead as a kind of felt presence about the night-watchers as they speak together, are blended naturally (and yet with real art) to make a perfect little study from New England life. The story is much beyond the ordinary line of what is thought good work, and is as excellent as the best Miss Jewett has done. There is much other fiction in the number, and in the first place ranks the beginning of Mr. Henry James's "Aspern Papers." Dr. Holmes, however, is the real new-comer of the month, with a new series of papers which he calls, with a faint reference to the celebrated Breakfast Table, "Over the Teacups." He does no more than display his design here, and tell a story of such coincidence as the Psychical Research Society is pleased to hear of, and he has a word to say of the Boston group of its investigators. It is intimated that other characters than the "Ego" will be introduced. Several weighty articles, which cannot be noticed at length, deserve mention. Mr. Cook's discussion of "The Marriage Law in the Colonies" is supplementary to his contribution last month, to which we called attention, and is equally wide in compass and historically interesting. Mr. Fiske's American paper is general in character, but as usual one reads it through; and Prof. Thayer's analysis of the Dawes bill, and the situation of the Indians under it, is a real help to the understanding of a complicated matter, in which many persons take a humane, and would be pleased to take an intelligent interest. The article points out what is left undone by the bill, and so stands as a summary of the present state of the Indian question.

—*Harper's* for March has many beautifully printed engravings which give it the look of a holiday number; and in the article upon modern Spanish pictures they are the principal means of informing us of the characteristics of the school. The text is mostly biographical—details of names, dates, education, and the leading triumphs of the artists make its substance, with a real sketch only of Fortuny, which gives us a close view of the man, his habits and character. The topic of travel is of most importance in the number. Mr. Warner's paper on the Northwest is especially admirable and instructive, because he does not merely record what he saw, but attempts very successfully to explain the greatness of the country that lies behind St. Paul and Minneapolis, give a full account of its railroad activities, of its spirit of advance, of the vast interests which are being created there, and generally to show that when the Westerner speaks of his country as being "big," he has much more in his mind than the extent of its acreage. It is altogether as good a paper as could be wished, to inform the Eastern mind of what the opening of the Northern wheat fields involved in the way of character as well as of material results. Mr. Howells's second Swiss paper is one of minor incidents and passing characterizations, after his usual style, and he has a quotable felicity of expression in his description of Geneva as "outwardly a small moralized Bostonian Paris." The region of the Saguenay is picturesquely treated, with as much attention to its poor, blueberry-picking, unkempt, and unhopeful people as to the beauties of its summer and winter scenery; and here, too, the illustrations are most excellent. An account of the Cherokee Nation, with some particular reference to the working of their land system, and one of the estate of the youngest son of Gen. Lee in Virginia, with some colonial reminiscences, take us to other parts of our country. Col. Higginson has a sketch of a provincial New England vagabond, and in near neighborhood to it is one of the Empress Eugénie, very well done; and there are several other articles, all interesting. The number altogether is one that ranks at an unusually high level of excellence.

—The leading article in *Scribner's* is a study of the campaign of Waterloo, by Mr. John C. Ropes. He remarks upon the confused and contradictory records of the battle to be found in different histories, and makes this the excuse for returning to the subject, which he tries to treat impartially, and he has given great attention to it. The paper, which is to be supplemented by a second, is confined to the battle of Ligny and the movements immediately preceding it. The narrative is remarkably clear, and the various lines of advance and action are treated in so orderly a way, and kept so distinct, that one has no difficulty in following them. The result is a curious illustration of Tolstoi's view that in war the things that are expected to happen never occur, and the issue depends on the bearing of many fortuitous influences. One could pick out half-a-dozen important instances of this in the two days' manœuvring which is here described, and, if Mr. Ropes's view is correct, these chances were what determined the campaign against Napoleon. He thinks Wellington was altogether in error at the outset, and "guessed wrong," as did also Napoleon. The occupation of Quatre-Bras by the English was an accident, and the wandering of Erlon's corps between Ney's and Napoleon's battlefields was the blindest kind of bad fortune, for if this body of troops had either supported Ney or enveloped Blücher's flank (and it just missed doing both), the advantage to the French might have been decisive.

The confusion of actual warfare, even under great generals, the limits of prevision, and the accidents liable to occur in execution of a definitely formed and ordered plan, are most notably exemplified. Another interesting article is Mrs. James T. Fields's account of the books of Leigh Hunt, which came practically in an unbroken whole to Mr. Fields, who scattered a good many of them, but retained enough to make a real literary treasury. Many of them were annotated after Hunt's familiar fashion, and, of course, several have associations with other literary men. Shelley's 'Diogenes' is here, noted by him in Latin and Greek. It was a favorite volume, and we may be allowed to express the hope that these notes may be copied off before they have entirely faded out—a fate which Mrs. Fields says is rapidly overtaking them. The article is illustrated with many cuts and facsimiles, and among the rest Severn's drawing of Keats from memory.

—In the forty-second annual report of the Director of the Harvard College Observatory, Prof. Edward C. Pickering states that the work of that institution has been largely increased during the past year by means of three important accessions to its resources. The plans for the study of stellar spectra have been greatly enlarged by Mrs. Draper's continued liberality; the fund left by the late Uriah A. Boyden for the establishment of a mountain observatory has been transferred by its trustees to the President and Fellows of Harvard College, and the researches undertaken by its means are now directed at Cambridge; and finally the income of the large bequest of the late Robert Treat Paine has been available for the support of the work of the Observatory during the entire year. Each of the three sources of income above enumerated is greater than that often provided for the entire maintenance of an independent observatory; and in comparison with what is ordinarily attainable, the Observatory of Harvard College can no longer be regarded as inadequately endowed. Perhaps the most urgent need of the Observatory at present is a new building, or such modifications of the old one as will adapt it to the requirements of modern astronomy; and the erection of a new residence for the Director seems desirable.

—As at other observatories, the interference of the unusually unfavorable weather is remarked; no more than sixteen eclipses of Jupiter's satellites, for example, could be obtained by the new photometric method, whereas sixty-eight might have been observed had the weather permitted. The work undertaken with the meridian photometer in southern skies is about half completed. No work of greater moment is now in progress at the Observatory than the researches in stellar spectra provided for by Mrs. Draper, and known as the Henry Draper memorial. Of the varied investigations undertaken, the work of photographing the spectra of all the brighter stars north of the twenty-fifth parallel of south declination is now complete. By means of the unique apparatus of prisms, eleven inches square, and having refracting angles of 15° placed in front of the object-glass of the telescope, spectra of stars have been obtained which bear enlarging to a breadth of four inches and a length nearly three times as great, and in which hundreds of lines may be counted. Nearly 28,000 spectra have been photographed in this work, and good progress has been made in the direction necessary to make these researches available to the astronomer and physicist everywhere. As the effect of color in stars is eliminated in this spectrum work, the results are becoming useful in fixing the absolute magnitudes of the stars with a greater precision than is possible with either the eye or the photometer. In pursuance of the terms of the Boyden bequest, much progress has been made in the determination of the fitness of certain mountainous regions for the location of a permanent observatory, by means of apparatus, spectroscopic and other, by which the steadiness and transparency of the air are tested and recorded. All the meteorological conditions of the atmosphere are examined by means of self-recording instruments. During the summer of 1887 complete sets of all this apparatus were tried by Prof. Pickering and his assistants on Pike's Peak, at Seven Lakes, and at Colorado Springs, at altitudes of 14,000 feet, 11,000, and 6,000 respectively. Also, Mount Lincoln, 14,300 feet, and Mount Bross, 14,000 feet, as well as other places, were visited, to determine the availability of these points for the permanent station.

—'Montaigne, Moraliste et Pédagogue,' by Mme. Jules Favre (Paris: Fischbacher; Boston: Schoenhof), is a volume written by a thoughtful student of Montaigne, who has wished to study him *à fond*, and who desires to communicate, "to all souls who are endeavoring to perfect themselves," the moral strength and elevation she has found in this study. She has thought she could achieve this object by a collection of sentences, paragraphs, and pages—texts of greater or less length—arranged under subjects, with a running comment of her own. Unfortunately, texts from Montaigne, like Bible texts, may be made to assume, when presented disconnectedly, a very different significance from that which naturally belongs to them. Unfortunately, too, Mme. Favre does not tell her readers from what edition of Montaigne she quotes, which renders it difficult to follow up her references. And again, unfortunately, a considerable number of her extracts are from the 'Natural Theology' of "Raymond Sebon" [*sic*], and she accepts the thoughts of the Spanish author as those of him whom she calls "son prétendu traducteur." The author, who is the widow of Jules Favre, the famous Republican leader of the later years of the Empire and the earlier ones of the Republic, is now the *directrice* of a school for girls at Sèvres, and the present work is the result of her reading of Montaigne with her classes there. This explains the general direction that she has had in view throughout, as well as the arrangement and choice of the extracts which she has given.

—All who are interested in the development of German historiography in the nineteenth century will welcome a recent monograph containing a short acount of the life and works of Germany's great master of constitutional history. It bears the title 'Zur Erinnerung an Georg Waitz, von August Kluckhohn' ("Sammlung gemeinverständlicher wissenschaftlicher Vorträge. Neue Folge. Zweite Serie, Heft 9." Hamburg: J. F. Richter. Pp. 36). Professor Kluckhohn was one of Waitz's numerous pupils, and occupies the same chair of history at Göttingen that Waitz once held. In speaking of the latter's influence, the writer says: "It is a fact that in France, Germany, and England, during the past twenty or thirty years, there has been no noteworthy investigator of the constitutional history of the early Middle Ages who has not in his researches leaned upon Waitz, deriving the greatest aid from his admirable literary knowledge and his exact investigations of innumerable questions of detail" (p. 11). "The figure of the fane of science and the priests in the service of the same has often been abused; but George Waitz was a real priest in the temple of science. He regarded the latter as something divine, and its service as a holy one. On that very account he was called to initiate others into it" (p. 17). Professor Kluckhohn's paper deepens one's impression that Waitz exerted a very widespread influence, and that he was a man of great versatility, though commonly regarded as one of the most conspicuous prototypes of minute historical investigators.

—Besides the various publications of M. Pierre de Nolhac, chronicling his successive discoveries of Petrarch autographs, the last few months have otherwise notably increased that abundant literature which clusters around the name of the leading personage in the interesting drama of the Renaissance. Two productions, in a certain way complementary to those of M. de Nolhac, are 'Un Decennio della Vita di M. Pietro Bembo,' by Vittorio Cian, in which three chapters are devoted, in great part, to the Cardinal's library, and to the autographic Petrarch codices once belonging to it; and an essay of much value by Dr. A. Pakscher, "Aus einem Katalog des Fulvius Ursinus," published in the *Zeitschrift für romanische Philologie* (vol. x., pp. 205–245), stating the results of a critical examination of the same codices, which passed from the library of Bembo into that of Fulvio Orsini, and thence into the Vatican. The outcome of Dr. Pakscher's investigations is to confirm—if confirmation were needed—the genuineness of the four Vatican codices. His article comes in good time as a response to the assault on the authenticity of the loose folios of "rough drafts" (Vat. 3196), made by Carl Appel (pp. 30–54 especially) in his very elaborate description of 'Die Berliner Handschriften der Rime Petrarca's.' This work is a memoir on the seven codices, containing the lyrics of Petrarch, which were acquired by the Prussian Government through its purchase of the Hamilton manuscripts. All but one of the seven are on vellum, but the oldest can hardly go back further than the first quarter of the fifteenth century. Dr. Appel gives them, however, an importance perhaps not quite deserved, by using them as the basis of some interesting discussions concerning the dates, form, and order of the sonnets, the text and arrangement of the Trionfi and other kindred topics. As to the variants of the Canzoniere which he cites, they are, of course, now rendered almost undebatable by the rediscovery of Petrarch's own final copy of his lyrical productions.

—'The Peasant Songs of the Ufimsk Government, District of Menzelinsk,' noted down by M. Paltchikoff, is an extremely interesting collection of Folk Songs which has just been published in Russia. This collection differs from that of the ordinary type, *i. e.*, from the collection of a few songs with pianoforte accompaniment, arranged according to the taste of some musician. And in the second place, it is restricted, not to a single government, nor to a single district, but to even less—to one locality. In the ordinary collection, the changes effected in order to render the songs presentable in cultivated form sometimes extend as far as a rewriting of the air, a change of time, and so on. The result is almost invariably the same: a peasant singer is unable to recognize an air with which he is familiar. The difficulty lies in the fact that hitherto all collectors (with the exception of Melgupoff) have failed to observe that no one singer executes the whole air when singing with a chorus. There are, practically, as many parts as there are voices, and rarely less than four; hence, attempts to represent a chorus by a song for one voice have never succeeded. M. Paltchikoff began his

labors like his predecessors, but, finding the single-voice system utterly inadequate, he listened more attentively, and this volume represents the result of his observations. Unfortunately for many persons whose skill in music is not great, the author has not furnished a single instance of combined harmonies, contenting himself by giving a number of them separately in exact illustration of the peasants' mode of procedure. Out of the 125 songs contained in the volume, 80 have never appeared in print. The text of the book presents more than 30 ballads which are not to be found elsewhere. The collection presents a very valuable mass of raw material, and is accompanied by a careful musical and literary index of the songs and collections used by the author for verifying his work, which will facilitate comparisons with material already published.

HISTORIES OF THE COLORED TROOPS.

A History of the Negro Troops in the War of the Rebellion, 1861–5, preceded by a review of the military services of Negroes in ancient and modern times. By George W. Williams, LL.D., Colonel and late Judge-Advocate in the Grand Army of the Republic. Harper & Bros.

The Black Phalanx; A History of the Negro Soldiers of the United States in the Wars of 1775–1812, 1861–5. By Joseph T. Wilson, late of the 2d Regt. La. Native Guard Vols., 54th Mass. Vols., Aide-de-Camp to the Commander-in-Chief G. A. R. Hartford, Conn.: American Publishing Co.

THE history of the American colored regiments is yet to be written. That remarkable achievement, the creation of a serviceable force of nearly 200,000 soldiers out of a race of helots, was not merely one of the most picturesque, but one of the most essentially interesting features of the great Civil War; and yet it has hitherto only found fragmentary chronicle in a few regimental biographies. The delay is easily explained. Unlike the white volunteer regiments, which usually came from a certain well-defined locality and went back to it again—their remnants kept together, their record safely cherished by local pride—the colored troops were either utterly scattered when disbanded; or else, if the rank and file of a regiment remained in one locality, they were soon separated from their officers, were stranded in a more or less hostile community, and had not themselves the education to write out their record. An attempt to form a national organization of those who had served with colored troops went to pieces, some fifteen years ago, on the question whether it should be confined to the officers or include private soldiers also, and it remains to be seen whether that projected last year in Boston will secure a more permanent existence. Meantime the materials for such a work have been steadily accumulating, and many misapprehensions, personal or local, have been cleared away. It is understood that an elaborate chapter on the origin and career of the colored troops has already been prepared for the series now in course of publication by the Century Company; and two independent histories by colored authors have appeared almost simultaneously to sum up the information already gained.

Both of these books show honest intentions and a certain amount of praiseworthy diligence. Both claim to be the result of much labor in archives and in personal intercourse; both are by authors who served with colored troops and who have had some literary experience; but both show a want of method and an inability to command their own materials, so that they leave the reader with a renewed interest in the subject, but with a very imperfect sense of clear comprehension. Each gives some facts and documents which the other omits. Of the two Mr. Williams's book is the more grandiloquent, while Mr. Wilson is grandiloquent once for all by yielding to the whim of calling the colored troops a "Phalanx"—a phrase corresponding to nothing said or done in the actual army, but so insisted upon by him that he speaks of the 54th Massachusetts Volunteers, for instance, as the "54th Phalanx Regiment," which is very confusing.

The want of clearness in both books is felt from the beginning, in the absence of any distinct and systematic account of the origin and first service of the pioneer colored regiments. Not that there is not much information given in regard to them, but it is so distributed in the different chapters of both books as to fail of all methodical impression on the mind. Mr. Wilson even says: "The date of the first organization of colored troops is a question of dispute, but it seems as if the question might be settled either by the records of the War Department, or the personal knowledge of those interested" (p. 123). But the facts are in reality well enough known, and nothing is needed to set them distinctly before the reader except a little method in the statement. Any apparent confusion results from the irregular action of the Government itself, which at first enlisted colored troops under some especial impulse or pressure, here and there, and immediately strove not to let its left hand know what its right hand was doing; which postdated the muster of the early regiments until the time when the regiment reached the minimum, even where they had been mustered in by companies; and which finally enhanced the general confusion by renumbering nearly all its colored regiments at haphazard, so that the earliest raised had often the latest numbers, and in four cases, at least, there were duplicate regiments with the same number—this happening with the 79th, 83d, 87th, and 88th. This was, however, later; but at the very beginning, although there were five infantry regiments of colored men organized during 1862, they were yet raised under such different conditions that all claims to priority must depend wholly on the ground on which such a claim is to rest. When we speak popularly of the priority of a regiment we may mean either (1) priority of actual enlistment, or (2) of *authorized* enlistment, or (3) priority in muster, or (4) in coming under fire, or (5) in sustaining actual loss of life. Now, if we adopt (1) the first standard thus given, the precedence belongs unquestionably to the 1st South Carolina, which began recruiting under Maj.-Gen. Hunter's orders (May 9, 1862), and one company of which was not, like the rest, disbanded under orders from Washington, but became the nucleus of the reorganization of the regiment under the same name (afterwards 33d U. S. C. T.), by authority given Brig.-Gen. Rufus Saxton (these orders being dated August 22, 1862), and commanded by Col. Higginson. But if we adopt (2) the second standard, the precedence belongs to the 1st Kansas colored (afterwards 79th U. S. C. T.), which was raised under authority given to Maj.-Gen. James H. Lane about August 1, 1862, had its recruiting officers appointed August 4 (see Wilson, p. 227), and had its first enlistment August 6; but was not mustered in (by companies) until much later, nor was its Colonel (Williams) mustered until May 2, 1863. If we accept (3) the date of muster as the basis of priority—as is the case with the rank of officers—the three regiments raised by Maj.-Gen. Butler at New Orleans should have precedence, being, indeed, enlisted after August 22, 1862—three months later than the (original) 1st South Carolina, and nearly a month later than the 1st Kansas Colored—but mustered in more promptly (September 27, October 12, November 24). These three regiments were the 1st, 2d, and 3d Louisiana Native Guard (afterwards 73d, 74th, and 75th U. S. C. T.), and commanded by Cols. Stafford, Daniels, and Nelson. But if (4) precedence under fire is in question, we come back to the 1st South Carolina, the pickets of which had a skirmish on St. Helena Island, S. C., under Capt. Trowbridge, October 26, 1862 (Official Army Records, xiv, 189). But, as no casualties occurred on this occasion, if we give precedence (5) to the regiment which first lost men in action, it belongs again to the 1st Kansas Colored, of which one officer (Lieut. Crew) and eight men were killed and nine men wounded at Island Mound, Mo., October 29, 1862 (Official Army Register of the Volunteer Force, viii, 256, 336), although this regiment, like the 1st South Carolina, had not yet been mustered in when thus under fire.

We are aware that Gen. B. F. Butler has recently made for the Louisiana Native Guard statements inconsistent with this, but we follow official authority. Gen. Butler's claim, made in the Boston *Herald*, August 6, 1887, that his colored troops were "out" fighting under Gen. Weitzel in "September or October, 1862," is unfortunately refuted by the correspondence between him and Weitzel (Official Army Records, xv. 158–171), from which it appears that Weitzel wrote (November 1, 1862) that the colored regiments had not yet arrived, and again (November 5) that he was not willing to command them. The first official reports of the Louisiana colored troops in action are dated April 11, 1863, when Col. Daniels reported to Gen. Sherman that a part of the Second Louisiana Native Guard had had a skirmish at (East) Pascagoula, and had behaved exceedingly well (Williams, p. 223). In this affair the regiment had three men killed and seven wounded (Official Army Register, viii, 249). It must be remembered by the historian of the war that these Louisiana regiments were at first enlisted under a proclamation calling only for "free colored citizens," and that Gen. Butler wrote to Secretary Stanton that "the darkest of them was about the complexion of the late Mr. [Daniel] Webster," and to Gen. Halleck that he had "kept clear of the vexed question of arming the slaves" (Official Army Records, xv, 555–6, 559). This is not said to diminish the great importance of the action of Gen. Butler in enlisting these regiments, but only to state it more definitely. It was very valuable as another entering wedge, but had an exceedingly limited scope as compared with the direct enlistment of slave regiments, as undertaken previously by Hunter, and subsequently carried out on so large a scale throughout the country.

The two works before us really supplement each other from the fortunate circumstance that each happens to fill gaps in the other. Mr. Williams's book is better arranged, although it leaves in this respect much to be desired; and although Mr. Wilson's has no index and his arrangement is confused, it is made so in part by the insertion of important documents not to be found in that of Mr. Williams. He has, for instance, a valuable narrative of the pioneer Northern regiment, the 1st Kansas, which has never yet had its fair share of prominence, partly because of the burning of the early records of the Kansas Adjutant-General, and partly through the more conspicuous service of the 1st South Carolina, and afterwards of the 54th and 55th Massachu-

setts. He also has some valuable reports from Gen. Gillmore's artillery officers as to the service of colored troops in the siege of Charleston. On the other hand, Williams has a fuller account of the earlier South Carolina operations, of the extensive recruiting under Maj. Stearns, and (on the whole) of the service of colored troops with the Army of the Potomac. He also gives the text of the Confederate orders which threatened the first officers of colored troops with hanging, and Wilson (p. 527) gives an instance where this threat was executed. Both writers give very fully the contest of these troops for full pay. Both do adequate justice to the pioneer officers in the matter, except that Williams omits all mention of Gen. J. H. Lane, to whose influence the organization of the 1st Kansas was due, and he also subordinates Gen. Saxton quite too much to Gen. Hunter. The latter will stand in history in unquestionable precedence as to arming the blacks; but it is also unquestionable that he did it, as he did everything, in a thoroughly impetuous and haphazard way; that he was habitually under influence of staff officers who had no sympathy with his efforts, and often thwarted them; and that his whole project would have gone to pieces unless revived, as it was, by the firmer purpose of Saxton. Even then there was no severer blow to the enlargement of the colored troops than when Hunter, with easy changeableness, recalled them from the St. John's River, whither they had been sent for the express purpose of penetrating into the interior and recruiting on a large scale. Mr. Williams is in error, by the way, when he speaks of Gen. Saxton as having "relieved Gen. Hunter at Port Royal, S. C." (p. 100), inasmuch as Gen. Saxton was not in direct military command at Port Royal, but received permission to enlist troops in the somewhat anomalous position of Military Governor; an office which he held under several different Department Commanders, including Mitchell, Hunter, and Gillmore.

Both these historians give what may seem a rather disproportionate amount of space to the early days of recruiting, and to the service of the first regiments organized. This is, however, inevitable; for the first contest of the black soldiers was really for the right to exist, to be trusted, to be decently treated both by friends and foes. After colored regiments had ceased to be a novelty, their history was inevitably merged in that of the army corps or divisions to which they respectively belonged. The whole number of individual colored soldiers mustered into the service—including, doubtless, as in similar estimates of the army generally, some reënlistments—is given by both Williams and Wilson, from the Adjutant-General's returns, at 178,975. These are further analyzed by Williams (pp. 139-40) as including 99,337 organized by the general Government itself and 79,638 by separate States and Territories. Of these, 36,847 are reported by him as having been killed or as dying in the service (p. 329); and the number of separate engagements in which they took part is given as 449. Such a list necessarily includes many trivial skirmishes; but as the official index of battles in which the colored troops actually sustained casualties includes 249 separate occasions (Official Army Register, vol. viii, Appendix) it is probable that the above larger estimate—including also those skirmishes where no casualties took place—may not be very much out of the way. The record of the colored troops, if painted in rather too glowing colors by these historians of their own race, is nevertheless a solid and honorable one; they not merely did all that which was originally expected of them by many of their advocates—namely, to hold points already gained by white troops—but really a great deal more; they held their own, as a whole, without need of special allowance; and they worked under many disadvantages in the way of poor arms, disproportionate fatigue duty, and slowly yielding distrust. When we consider the many curious and almost inexplicable disappointments of the war—as, for instance, how much less aid than was expected the Union Army received from the officers trained in European wars—the actual service rendered by the colored troops needs only to be modestly stated in order to be fully recognized. And had that actual service been far less, the mere fact of their existence was an important element in the whole bearing of the strife on public sentiment. Each new volume of the invaluable 'Official Records of the War' reveals to us, by the letters and despatches of Confederate officials, the fact that the arming of the blacks produced precisely the impression desired upon the Southern mind, and was an essential element in the gradual discouragement and decay of the Confederacy. The predictions of Chase and Wilson at Washington, of Hunter, Saxton, Phelps, and Thomas in the field, were being vindicated all the while, had the North but known it, in the solicitude and anxiety produced behind the lines on the other side; while, at the North, the fact that the negroes had actually borne arms for the Union and on so large a scale, was perhaps the most important immediate factor in that great change of public opinion which ultimately placed the ballot in their hands.

LESSEPS'S RECOLLECTIONS.

Recollections of Forty Years. By Ferdinand de Lesseps. Translated by C. B. Pitman. 8vo. 2 vols. D. Appleton & Co. 1888.

M. DE LESSEPS is one of the notable old men of our era of old men. He is the junior of the Emperor William by eight years, and of Moltke and Bancroft by five, but he is the senior of Bismarck by nine years, of John Bright by six, and of Gladstone by four. He entered the consular service at the age of twenty, and was employed in that and in the diplomatic service for almost a quarter of a century. After his voluntary retirement from office, the great enterprise which he carried to a triumphant conclusion, and which cannot fail to secure his permanent fame, brought him into contact with the leading spirits of the age, with whom he treated on a footing of equality.

The genuine memoirs of such a man could not help possessing surpassing interest, and would be received with acclaim by the entire reading world, and also by the world which seldom if ever reads. But the book which he now gives forth is far from meeting the expectations which its title naturally arouses. Only a very small portion of it can by the most strained construction be included under the designation of "Recollections." It is difficult, indeed, to surmise what purpose its author had in view in offering it to the public. Much of it is devoted to the two gigantic schemes to which M. de Lesseps has given the last thirty years of his life, and may be regarded as a huge pamphlet designed to influence public opinion in favor of the Panama Canal. Whatever effectiveness it may possess in this capacity would probably have been enhanced by omitting several chapters which swell the bulk of the volumes, but make the impression of being dragged in without rhyme or reason.

Fully one-half of the entire work recounts the beginnings of the Suez Canal, but presents very little new material. It consists of extracts from a journal kept from 1854 to 1863, supplemented by letters, documents, and speeches. Its chief interest lies in recalling the marvellous energy, persistence, and force of character which M. de Lesseps displayed in overcoming the obstacles he encountered before the canal was even begun. It may be assumed that his object in rehearsing this history is, not to vaunt himself, but to reason by implication that inasmuch as he made the Suez Canal a perfect success in spite of all the drawbacks he had to contend with, he can do as much with the Panama Canal. The difficulties, however, differ radically in the two cases. His great trouble in the first was the narrow policy of British statesmen who, following the lead of Palmerston, opposed a dogged resistance. The only notable exception was Gladstone. Lord Palmerston's hostility was rendered more formidable by the professional opinion of Robert Stephenson, who was very positive that the project was not practicable. The result has demonstrated how easy it is for great men to commit great blunders; but this is not a new discovery, as equally great blunders were committed by the eminent experts who confidently predicted that no locomotive could drag a railway train, and that no steamship could cross the ocean.

In the case of the Panama Canal, M. de Lesseps has struck upon a rock which has wrecked many a magnificent project. An error in calculation seems a small matter in itself, but it has proved fatal in many instances, and bids fair to do so in this. If the Panama Canal turns out a failure, it will be mainly for lack of money. Perhaps the most instructive lesson to be drawn from the contrast between the two undertakings is this: When M. de Lesseps conceived the project of a canal at Suez he was forty-nine years old; he went to work cautiously, deliberating on every step he took; he had the more or less active support and sympathy of several powerful governments, and he fell upon a sanguine and optimistic period. On the other hand, when he embarked on his Panama project, he was seventy-four; he was naturally flushed with success, and animated by the same exaggerated confidence in his star that led the first Napoleon to his doom; he had to depend for material support upon a country and a time which had suffered severe drains and losses, and was neither able nor willing to furnish the unlimited funds without which he was helpless. If the final verdict should be that M. de Lesseps, like many other famous men, has outlived his usefulness, it will be well to remember, not only that no subsequent failure can dim the splendor of his one great achievement, but that even before he entered on that he had already, although a comparatively young man, a useful and honorable career behind him.

The first three chapters of the present work give some intimation of the interesting reading which his genuine autobiography would have offered. The first, of 119 pages, relates the circumstances under which he accepted a mission to the short-lived Roman republic in 1849, and how, in consequence of not receiving the support of his Government in the course he pursued, he retired permanently from the diplomatic service. His mission was a difficult one, and the impression one gains from his recital is that he was made a cat's-paw by the home authorities, and became a victim of their vacillating policy. The French Government was in a transition stage, and did not know its own mind, being torn by internal conflicts which culminated in the *Coup d'État*. M. de Lesseps, in a letter written November 30, 1859, ten

years after, gives the following no doubt accurate account of his political status:

"My whole life has been spent in the service of my country, nor have I ever meddled in home politics. I have never once set my foot, even out of curiosity, in a public political meeting of any kind. During my thirty years' consecutive employment abroad I was only four times on leave in Paris, and I was not present at the revolutions of 1830 or 1848. Put out of active employment upon my own demand, in 1849, and receiving no pay or pension, I devoted myself entirely to my family, and succeeded in making good the inroads upon my small fortune caused by the expenses of my latest missions abroad" (vol. ii, p. 134).

From an American point of view this seems an odd statement to be made by a man who on many occasions demonstrated his patriotism; but in France the conditions here indicated are almost the only ones on which an honorable man could remain in the public service without forfeiting in some degree his self-respect. It is a sad commentary on French history of the past half century, but it is a true one.

Another interesting autobiographical fragment is the following, on page 129 of the first volume:

"At the age of twenty I was sent upon a mission, in the year 1825, under the orders of my uncle, J. B. de Lesseps, the sole survivor of the La Pérouse expedition, who was then Chargé d'affaires at Lisbon. Since then I have held different posts in the administration of foreign affairs at Tunis, in Algeria, in Egypt, in Holland, and in Spain. At the outbreak of the Revolution of 1848, M. de Lamartine summoned me from Barcelona to Paris, and sent me to Madrid as Minister Plenipotentiary. I had been eight years in Spain, during which time I had been upon terms of intimacy with the principal generals and public men, and though I had never mixed myself up in the political dissensions, I had established friendly relations with all the different party leaders. Lamartine said to me, 'We are at the beginning of a revolution here; we cannot tell if foreigners will be friendly to us. It is important for us that things should be quiet in Spain. You know the court, the representatives of the different political parties, and the population at large.'"

M. de Lesseps remained in Madrid only a year, and was then sent to Rome, after which, as already related, his diplomatic career came to a close. According to his own statement, his return from Rome was the origin of the Suez Canal, to studying which he gave up his time because he had nothing else to do. Mr. Senior, however, in his 'Conversations and Journals in Egypt and Malta,' relates that it was mainly by the advice of M. Mathieu de Lesseps, French Consul-General in Cairo, and father of M. Ferdinand de Lesseps, that the Sultan selected Mehemet Ali as Pasha of Egypt, and that when Ferdinand became Consul-General, Mehemet Ali reposed much confidence in him, and intrusted to him in a great measure the education of his favorite son, Said Pasha, Viceroy of Egypt from 1854 to 1863, under whom and whose successor the canal was undertaken and carried to completion. M. de Lesseps's own account is as follows:

"The successor of Abbas Pasha, the Viceroy of Egypt, was the youngest son of Mehemet Ali, whom I had known well as a child, and taught to ride. He was enormously fat, and I made him take exercise, much to the delight of his father. This lad, who was very intelligent, was made to learn fourteen lessons a day. Mehemet Ali said to me one day: 'As you are interested in my son, here are his notes.' I told him that I did not wish to see them, as I could not read even then very well, and all I wanted to see was the last column showing his weight for the past and the present week. If there was an increase, I should punish him, if there was a decrease, I should reward him."

This must have been between 1836 and 1838, while the consulate of the elder De Lesseps was thirty-three years earlier. It would thus seem as if fate had decreed in advance who should build the canal, for it is highly probable that but for the circumstances just detailed there would never have been a canal.

Among other passages which throw an amiable light on the straightforward character of M. de Lesseps, is one, a little too long to cite, in which he recounts how, in 1848, he recovered from the mob in possession of the Tuileries the jewels and other valuables belonging to the Infanta of Spain. M. de Lamartine, to whom he applied for the property in the first instance, said that the people in the Tuileries had erected barricades and would allow no one to enter the palace. He had no power over them, but referred De Lesseps to the Mayor of Paris. The Mayor was also afraid to tackle the mob, but gave him a letter of introduction to their leader, without knowing whether they had one. De Lesseps took this letter to the gate, and said that he was the Ambassador of the French Republic in Spain, and wanted to recover the property taken from the Infanta. The result of taking the bull by the horns in this courageous manner was that, after some parleying, all of the goods were surrendered to their lawful owner.

There are other instances of boldness and dash which only increase the regret of the reader that M. de Lesseps did not omit his incongruous chapters on "Steam," "Abyssinia," "The Origin and Duties of Consuls," and the like, and give us, instead, more copious extracts from the journals which he seems to have kept, and which it is to be hoped will some day see the light.

RECENT FICTION.

Sabine's Deception. By Princess Olga Cantacuzene-Altieri. Translated by E. Nute. Harper & Bros.

The Last Von Reckenburg. By Louise von François, translated by J. M. Percival. Boston: Cupples & Hurd.

Narka the Nihilist. By Kathleen O'Meara. Harper & Bros.

Hithersea Mere. By Lady Augusta Noel. Macmillan & Co.

The Right Honorable. By Justin McCarthy and Mrs. Campbell-Praed. D. Appleton & Co.

Free Joe. By Joel Chandler Harris. Charles Scribner's Sons.

'SABINE'S DECEPTION' is a good story of French provincial life, wretchedly translated. Its atmosphere is pure and clear, and the people have a moral excellence which would repay the study of Parisian journalists and playwrights. Sabine's whole life had been so open to the sunlight that the little deception practised to insure her sister's happiness seemed to her a deed of darkness, and doubtless caused her more anguish than did the relinquishment of her lover, so faithful in letter and faithless in spirit. Sabine is drawn carefully from nature. The author perceives, as it almost seems that only French novelists can perceive, that truth has many sides. Sabine is positive, prejudiced, rigid, but she is also courageous, loyal, and full of passionate tenderness for those dependent on her. No sort of perfection is ascribed to Sabine, but a natural proportion is observed between her defects and her good qualities. Of course, the sacrifice which marks the victory of her strength over her weakness, is made for people who can never remotely appreciate its fineness. In fiction such a sacrifice is rewarded by the reader's sympathy. The Sabine of romance gets enthusiastic admiration; the Sabine of reality goes on till the end, managing the farm, studying the causes of potato rot, and spoken of behind her back as a hard, cross-grained old maid, who has no soul above a sixpence, and never had.

Women novelists are too apt to imagine an ideal beauty in instances of self-sacrifice that are wild or foolish and lack any sense of personal dignity. The author of 'Sabine's Deception' does not confound fantastical nonsense with real nobility, nor does the half-French, half-German author of the 'Last Von Reckenburg.' The noble Fräulein Eberhardine is not unlike Sabine, and is forced by the same natural characteristics to a similar act of renunciation. She is bound, by what in fairy tales is described as the mysterious laws of her being, to defend the weak and unworthy who depend upon her, no matter how great the cost to herself. Then the obligation is increased by a sense of what is due to her own rank when protection is demanded by a plebeian, one whom circumstances have made her companion and, with certain reservations, her friend. The novel in which Fräulein Hardine displays the nobility of her nature and of her order is thoroughly romantic. The scene is laid in the early years of the century in a German village where the Von Reckenburgs subsisted chiefly on the consciousness of their long descent and on the deference accorded it. Their feeling that a Von Reckenburg is neither degraded by poverty nor exalted by riches, that personal dishonor is as impossible to them as personal dishonesty, is so genuine and delightful that a fiery radical could scarcely withhold respectful acquiescence. The village never dreams of questioning the validity of the poverty-stricken Von Reckenburgs' claim to superiority. When Dörl, the common sinner, grovels at the patrician Hardine's feet and is lifted, comforted, and shielded from the worst consequence of her sin, there is an almost comical recognition of the immeasurable social distance between the two. The beauty of the story is that the reader accepts the situation as naturally as Dörl and the rest of the villagers, and the credit of this effect should be given to the author's unpretentious, sincere literary manner. The interest in Hardine's sorrows and Dörl's sins is strong enough to survive the artistic blunder of telling the end before the beginning. The translator has done his work well, and has resisted the temptation to sacrifice his author to prevailing fashion in style or to personal idiosyncrasy.

The opening of 'Narka the Nihilist' promises an exciting display of heroics. Narka is a Jewess dependent on a noble Russian family; her father and brother have suffered a shameful death from Russian tyranny, and her personal beauty is of the superb, heroic type. All these preliminary statements prepare the reader to assist at midnight conspiracies, to hear the whiz of bombs, and to wade with Narka through tyrants' blood to victory or death. Expectation of horrors is, however, disappointed. Narka aids her lover, Prince Basil Zorokoff, implicated in a plot against the Czar, to escape across the frontier, and herself suffers a short imprisonment in Cronstadt. But she escapes to Paris, where, being inveigled to one Nihilist meeting, the dirt and disreputableness of the conspirators disgust her and terminate her Nihilistic career. The author has herself no fixed ideas about Narka, and her uncertainty about Prince Basil is equally certain. Sometimes he appears to be splendidly firm and loyal, and sometimes he is a vacillating cringer to authority and caste. He is a miserable creature by contrast with his sister, the Baron-

ness de Beaucrillon. She is an unimpeachable Russian aristocrat, an exquisite creature, all grace and delicacy and charm, with a high and holy belief in the knout as the instrument appointed by God for keeping people in their proper place. There is no evidence that the author has ever personally observed Russian princes and princesses, or that she has thought out the behavior of sane people in situations of vital import. Her plan is as undetermined as are her characters. She is not hampered by any necessity for arranging events which march in logical succession to a catastrophe, but alternates storm and calm mechanically, and introduces capriciously occurrences which have nothing to do with what is supposed to be her original motive. The summing up of the whole matter is not a dénouement, but an end which is just as delightful for a novel about a Yankee girl as for one about a Russian Jewess. Narka, having "tasted something of the inebriation that comes to those who drink the bitter cup with courage," appears in "Norma" at *La Scala*. The King of X——, a most excitable monarch, is present. He "rushes on the stage, and conducts the beautiful artist to the royal box, where the Queen embraces her, and, drawing a costly diamond ring from her own finger, places it on Narka's amidst cries of *Evviva la Regina! Evviva la Narka!*"

'Hithersea Mere' is another novel written on the happy-go-lucky principle. The beginning foreshadows a tale of decorous sorrow verging on solemnity, and we so attune our mind. The theologian and poet, Jasper Somerville, is dead. The world mourns its loss; his widow is plunged in woe, and his daughter, Rhona, knows that no matter for whom the amaranths may bloom in future, for her they bloom not. The first gleam of light comes with the suggestion that a biography of the honored dead be written. Rhona eagerly accepts the proposition, and drives her reluctant mother to the work. Together they proceed to an uncle's house in Essex, close by Hithersea Mere and several other natural features equally entitled to the distinction of supplying a name for the novel. Round this house centre the people who make the story, and there would centre the movement if there were any. These people are quite remarkable. There are four or five men who love but once and love for ever; there are several maidens who spontaneously bestow their affections unsought, and one who dies rather than recall or transfer hers. This modern Elaine is the last person to be suspected of intensity. Her name is Hilary. She is the granddaughter of a bishop. She practically lives in a donkey-cart in the society of ferrets, which it is her delight to turn loose on the county rats. When in very high spirits, she takes the ferrets home and sets them on to bite her grandfather's stockinged legs. Her apparently light nature is steadied by her love for a blind man who won't have it, and coldly permits her to die rather than yield. While all this is going on, Rhona is nagging her mother to despair about the biography, and, at the same time, making her running with Adrian Mowbray, the lord of Hithersea Mere and territory lying adjacent. He, like the blind man, has loved once and for ever. He is a power in politics, and has written for reviews articles not to be mentioned in the hearing of Christian ears. His services are enlisted for the biography. The divine's letters break down his scepticism, and the divine's daughter takes the place of the lost first love. This outline can convey no idea of the agony in which these rare souls are perpetually writhing—an agony which they lay aside as a garment when duty calls them to county dinners, garden-parties, and Sunday-school feasts. The scenes and people have been common property of English novelists for two generations, and the author's talent is most conspicuous in the original conceit of the biography, and in her erratic principle of selection.

'The Right Honorable' is what it professes to be, a novel of English politics and society. No attempt is made to philosophize London society, with its extremes of refinement and vulgarity, its forms and ceremonies arbitrarily enforced and as arbitrarily scattered to the winds by the few who have the privilege of making and breaking; but a fairly good panoramic view is presented, and the showmen never linger long enough on one scene to weary the audience. Excepting that a change of form of government at the end of the reign is foreshadowed, the political crisis imagined has no serious significance. The sketches of British politicians and their methods are clever, and some scenes in the House of Commons are described with vivacity and notable literary effectiveness. The plot is conventional, but is the construction of people who know their trade, who have the end in view from the start, and never lose sight of it or distract the reader by a wild-goose chase.

The first scene is on a home-bound Australian steamer, where the principal characters, Sandham Morse and Kooràli Middlemist, meet for an hour and part. Ten years afterwards they come together in London. Morse is the Right Honorable and happily married to Lady Betty, a frivolous, bright, good woman, with a great regard for the court, to which her radical husband is antagonistic. Kooràli is Mrs. Crichton Kenway, with a husband at once a scamp and a cad, and two children. It is directly foreseen that Morse and Kooràli will love each other, and as instantaneous is the conclusion that even if in reality any harm and scandal should come of it, in a novel written by respectable British authors for the respectable British public nothing very shocking will be permitted. Therefore the interest in the dénouement is not too intense to exclude enjoyment of all that leads to it. Therefore, too, one cannot enter into Morse's emotional difficulty about "ordering his stout heart to bear it" when his wife, Lady Betty, has run away from him with her father, and Kooràli, after much agitated discussion, has decided to run away both from him and her intolerable husband with her children. It is all so much a foregone conclusion that Morse's agonized reminiscence of Horace is decidedly foolish. It is a symptom of laziness when experienced novelists resort in a strait to the *deus ex machina* of the distraught playwright, the virtuous, all-helpful, not to say irreclaimably meddlesome friend. Such a one appears here in the person of Lord Arden, a quiet, well-bred gentleman, whom the authors, meaning to exalt, have really maligned.

The literary workmanship is so smooth that though from knowledge of their separate work one may ascribe certain passages to Mr. McCarthy and others to Mrs. Praed, the two hands are not easily distinguishable. The intellectual level is never low. The prevailing tone is lightly satirical, but the whole history of humanity is not reduced to a series of light ironical jests. The most flippant and silly have moods that resemble seriousness, and, through all the clatter of ready tongues and clash of conflicting interests, there is an echo, a murmur, of the great movement of a great world.

Mr. Harris's stories bound together under the title 'Free Joe' depict the life and characters with which he has already made us familiar. The Georgian negro, bond and free, the poor white, and the mountaineer are given enduring life by his pen. It may be heresy to suggest it, but one feels that his portraits of the Southern aristocrat, as he was before the war, are no less truthful. The rich young slave-owners with rather provincial tongue, views, and clothes, who rejoiced to sit by the hour in the corner grocery with their heels in the air, have a startling semblance of reality. The war undoubtedly deprived them of traditionally magnificent surroundings, but it can hardly be responsible for a total disappearance of the haughty mien tempered by infinite condescension, the unvarying elegance of diction, the chivalrous virtue, with which fancy loves to invest the old-time despot. In all his stories Mr. Harris prefers to describe the relation between master and slave as one of loving protection and grateful devotion, rather than one of brutal terrorism and craven fear. The master is always a hero to his valet, and the valet's love for the master passes that of a brother. Fortunately for those who like a pleasant tale, the author stands apart from the crusade to divorce the true and the beautiful.

TWO ENGLISH TOWNS.

Oxford. By Charles W. Boase. [Historic Towns. Edited by Edward A. Freeman and the Rev. William Hunt.] Longmans. 1887. 8vo, pp. viii, 230.

Exeter. By Edward A. Freeman, D.C.L., LL.D. [Historic Towns.] Longmans. 1887. 8vo, pp. xiii, 255.

Mr. Boase gives as the argument of his book the following quotation from Mr. J. R. Green:

"The University of Oxford is so far from being older than the City, that Oxford had already seen five centuries of borough life before a student appeared within its streets. The University found it a busy, prosperous borough, and reduced it to a cluster of lodging-houses. It found it among the first of English municipalities, and it so utterly crushed its freedom that the recovery of some of the commonest rights of self-government has only been brought about by recent legislation. The story of the struggle which ended in this usurpation is one of the most interesting in our municipal annals, and it is one which has left its mark not on the town only, but on the very constitution and character of the conquering University" (p. v).

Mr. Boase describes in detail this long struggle between "town and gown," showing us how, in consequence of a riot in which the townsmen killed about forty scholars, Edward III. in 1355 deprived the city of important judicial and administrative powers, and conferred them upon the University (p. 90); how from that time the latter grew steadily in power (p. 91), and how, at Wolsey's request, Henry VIII. in 1523 granted a charter which "virtually placed the greater part of the city at the mercy" of the Chancellor and Scholars (p. 103).

After this, the author has so very little to say concerning the civic constitution of Oxford that the uninformed reader will, we fear, infer that the city as a municipal entity ceased to exist. But this was not the case. In chapter ii. Mr. Boase ably describes the early organization of the municipality, which differed very much from that of the seventeenth and eighteenth centuries. He alludes to the latter on page 182 when he says: "The townsmen were, in fact, uneasy under the government of a narrow corporation." Mr. Boase nowhere describes this "narrow corporation"; nor does he give us any account of the later courts, officers, and other machinery of Oxford town government. Turner's 'Selections from the Records of the City,' though relating only to the sixteenth century, furnishes sufficient data

to fill up this *lacuna*. Even the important Reform of 1835 is disposed of in a few words (p. 208); we are not told in what it consisted—what was superseded by the new civic constitution. Some of the more minute details concerning the inner life of the University might well have been omitted to make room for a few pages concerning later municipal history.

In justice to the author it must be said that the projectors of this series have very shortsightedly chosen to relegate internal municipal history to a subsidiary place in each volume. But Mr. Boase has shown a somewhat greater neglect of this subject than the other contributors to the series—a neglect which even the domination of the University does not fully justify. We must not, however, dwell too long upon a minor blemish in a book which, taken as a whole, is a most meritorious piece of work. The author displays all the qualities of an accurate, painstaking scholar, with a comprehensive knowledge of his authorities and the power of using them judiciously. He gives us an excellent account of the development of the University and of the participation of Oxford in the national life of England. We highly commend the book to all who are in any way interested in that

"Sweet city with her dreaming spires."

"The present volume," says Dr. Freeman in the preface to his 'Exeter,' "I wish it distinctly to be understood, does not represent any independent research into the Exeter archives. Of those archives, both municipal and ecclesiastical, I know enough to be able to say that they are of very high importance; and it is to be hoped that they may some day be given to the world in the series put forth by the Master of the Rolls. But to study them as they must be studied in manuscript would call for the offering of no small part of a life, and such an offering it is clear that I cannot make." As the printed materials for the study of the history of Exeter are extremely meagre and, in great part, unreliable, no one—not even so distinguished an historian as Mr. Freeman—can write a satisfactory sketch of its annals without consulting the manuscripts in the archives of the town. Is it because the author is inexperienced in the manipulation of original records that he considers "no small part of a life" necessary to explore those of Exeter with any degree of success? As the municipal muniments of this city are remarkably complete, extending back to the time of Edward I., and are admirably arranged and catalogued, we do not hesitate to affirm that a student versed in the mysteries of mediæval paleography and accustomed to investigate original sources, could make very valuable additions to the sum of our knowledge concerning Exeter by working only a few weeks in its archives. That Mr. Freeman refrained from doing this is the more to be deplored because his example is likely to influence forthcoming contributions to the series of which the volume before us forms a part.

This shortcoming is most apparent in the author's account of the municipal development of the city, which is very deficient, especially those portions relating to the Middle Ages. In his account of the momentous transformation of the town government from a democracy to an oligarchical Common Council (pp. 141-153), he plainly stands on shaky ground. Many of his data, whether derived from Izacke or Hoker, are to be accepted with distrust. He does not clearly inform us even in what century the oligarchical element began to prevail, and he is plainly at sea with regard to the early dual character of the Common Council — "the twelve" and "the twenty-four." He himself admits here and there that he needs "further light" (pp. 147, 148, 165). This he would doubtless have found had he scrutinized the dorse of the early Court Rolls in the civic archives of Exeter. Still, it would be unjust not to add that his account of the growth of this "select body," however unsatisfactory and incomplete, is interesting, and that he deserves much credit for confronting an important problem which most local historians of England pass over in silence.

The following few sentences contain some serious errors:

"In the reigns of John and his son, Henry the Third, three changes took place at Exeter which gave an abiding shape to the civic and ecclesiastical state of the city. The municipal constitution of the city, its parochial divisions, the constitution of the cathedral church, were all now remodelled after the types common to other cities and other churches. . . . From the year 1206, or earlier, the *Præpositus* or Reeve ceases to be the head man of the city. A succession now begins which has gone on to our own day, that of the Mayors of Exeter. . . . The Reeve or Provost had been a royal officer; the Mayor was the chosen head of the citizens; . . . the King or other lord now deals with an organized body capable of acting as an artificial person. A little later the lord's dues have changed into a fee-farm rent, and the appearance of the Mayor most likely marks the time of this change also. This great landmark in the history of the city seems not to be fixed by any surviving charter. . . . Exeter has now a chosen chief magistrate, and her citizens are now addressed in various corporate styles. . . . The work of making is now done. The city stands forth fully finished, in all its points, municipal and military, episcopal, monastic, and parochial" (pp. 57-59, 72).

The reeves of English towns, during the reign of John, frequently became elective without assuming the title of mayor. The grant of the mayoralty did not create a corporation, as Mr. Freeman and old jurists assert; it was only one of several steps in the development of the corporate conception. The presence of a mayor had nothing to do with the possession of the fee-farm; the bestowal of the latter, in many cases, preceded the advent of the former by several decades. The municipal constitution of Exeter was far from complete at the close of this period (A. D. 1225). We will call attention to only a few of the many formations added to the civic polity in later times. Here is one which we will describe in Mr. Freeman's own words:

"A charter of this king (Edward II.) establishes the judicial powers of the elective magistrates within the city and its suburbs. The pleas of the Crown were reserved to the officers of the Crown, but the lesser jurisdiction, civil and criminal, pleas of land and tenements, trespasses and contracts, were entrusted to the Mayor and bailiffs. As the city was not yet a distinct county, and as the Earls were dangerous neighbors, this judicial independence was a most timely privilege" (p. 86).

Now, "judicial independence" is regarded by the best authorities as the corner-stone of the English municipal constitution, as its most characteristic feature. Again, Parliamentary representation was not yet a recognized institution of boroughs in 1225. The erection of the city into a separate county was another important step in advance. "In his [Henry VIII.'s] day the city received the highest privilege that can be given to an English city or borough. He gave two charters to Exeter, by the second of which, in 1537, the city was severed from the body of the county of Devon, and became a county of itself, with all the rights of a county, under its own Sheriff" (pp. 98, 99). And yet Mr. Freeman says that already in 1225 "the city stands forth fully finished." The absurdity of his position becomes still more apparent when we consider that he himself takes pains to describe a complete revolution of the town government from a democracy to an oligarchy, which, according to his own account, could not have begun before the fourteenth century. The gravity of such errors is augmented by the fact that he has striven "to make this volume in some sort introductory to the other volumes of this series" (p. v).

In defining the classes of English towns, in pp. 1–4, the author ignores two important modes of classification—both more organic, more exhaustive, and more useful than those which he mentions—namely, the division into royal and baronial (or manorial) boroughs, and the grouping of towns according to their affiliation with certain typical municipalities, whose laws and customs most of the other communities borrowed. (See the *Antiquary*, vol. xi.) Mr. Freeman says that Kingston-on-Hull "stands almost alone as a great and abiding haven called into being at the bidding of a single far-seeing king" (p. 3). This notion concerning the origin of Hull was exploded as far back as 1827, by Frost in his 'Notices relative to . . . Hull.' The statement, on p. 155, that "the Recorder in short is a lawyer; the Chamberlain is bound to be a local antiquary," is more epigrammatic than accurate. The Municipal Reform Act was passed in 1835, not in 1836, as stated on pp. 228 and 230.

The redeeming feature of the book consists in its many apt comparisons between the municipal development of England and that of the Continent. Here are some examples:

"Again, the English town always remained a mere municipality; it never became an independent commonwealth, like an old Greek or Italian city, not even like a free city of Germany, Italy, or Provence, an independent commonwealth, less the rights of the Emperor" (p. 60).

"The history of Exeter is less than the history of Nürnberg because the history of England is greater that the history of Germany" (p. 61).

"The home of a city in its municipal character, its place for assembly and debate and administration of justice, is the Guildhall. In idea it is the first of the three chief buildings of a city, alongside of the church of the Bishop and the castle of the King, or other lord. . . . But it comes of the special character of English history that nowhere in England does the municipal element stand forth before all eyes in the shape of a building on a level with those which represent the military and ecclesiastical element. Nowhere does the municipal house proclaim itself as the true head of the city, nowhere does it announce its presence from afar, like the cities of Italy and Flanders, by towers rivalling the proudest of those that shoot up from the minster or the fortress. In England the palace of the King at Westminster has become the *palazzo pubblico* of the whole nation" (p. 179).

Biographies of Words and the Home of the Aryas. By F. Max Müller. Longmans, Green & Co. 1888.

Like all Professor Müller's publications, this book addresses itself both to scholars and to the wider public. He eminently possesses the art of making philological research generally attractive, and popular discourses interesting to those who know; but of the dozen essays composing the collection, only the two longest, "The Home of the Aryas" and "The Earliest Aryan Civilization"—together more than two-fifths of the volume—possess a general interest. Though strictly philological, they have an historical character, and they complete each other. In them the author contends, both with the weapons of comparative philology and discursive dialectics, for the correctness of the view that the original common home of the Aryan, or Indo-Germanic, nations was somewhere in the interior of Asia, and probably in

the vicinity of the upper course of the Oxus, whence, at a remote period of antiquity, the Indic and Iranian peoples migrated southeastward, toward Hindostan and Persia, and the Hellenic, Italic, Celtic, Teutonic, and Slavic northwestward, spreading over Europe. A quarter of a century ago this view was generally held by scholars, but latterly it has been repeatedly assailed in learned monographs. At one time Professor Müller himself, on the strength of a few linguistic facts, was inclined to follow Benfey in fixing the Aryan home on the borders of Asia and Europe, near the shores of the Black and Caspian Seas; but he has returned to his earlier conviction, after a study of the bolder antagonistic opinions lately propounded by philological dissenters.

Of these Lazarus Geiger places the original home of the Aryan race in Germany, Cuno in the centre of that country, Poesche in its southwestern corner, Tomaschek in eastern Europe, and Penka in Scandinavia. One of the main facts that have induced philologists to declare against Asia as the cradle of the race is the absence of common Aryan names for animals which must have been known to the early inhabitants of that continent. Such animals are the lion, tiger, elephant, and camel, the names of which in the Indo-Iranian languages are different from those more or less common to the Aryan idioms of Europe. The name of the dog, on the other hand, is common to both main divisions of the Aryan family, being *kyōn* in Greek, *can-is* in Latin, *hun-d* in German, *kú* in Irish, *szů* in Lithuanian, *svan* in Sanskrit, *span* in Zend. (Let those of our readers who may be startled by such apparently bold identifications reflect that in the Latin subdivision itself *can-is* has been modified into French *chien*, which a Slav would phonetically write *šj*; *calx*, lime, into *chaux*, which in English is to be spelled *shō*; and *caulis*, cabbage, into *chou*, pronounced *shu*). This is a negative argument against the Asian home, but the positive is stronger. The northwestern and southeastern Aryas have a common name for the bear, for instance—identical in derivation, though not in sound; consequently "they must, unless it can be proved that one language borrowed the word from another, have known the bear before they separated, and have lived in a country where that animal was well known." Their common name for the birch tree—*bhūrga* in Sanskrit, *bereza* in Russian, *Birke* in German—points in the same direction.

But these arguments are far from decisive; in fact, our author treats them as crumbling at the first touch. That the Aryas sprang from a very southern climate he and his school never pretended; it has long been known that they had common names for winter (Sansk. *himā*, Lat. *hiems*, Slavic *zima*), ice (Iran. *isi*), and snow (Slav. *snieg*, Lat. *nix*, Zend. *snizh*, to snow). The region which is generally fixed upon by the upholders of the Asiatic origin of the Aryas has long winters, ice, and snow, and birch-trees, and neither lions nor tigers, as appears from the following "classical passage" of the Central-Asiatic traveller, Ujfalvy: "Les vallées qui avoisinent le Pamir . . . satisfont à toutes les données de la paléontologie linguistique. Il y a là un pays froid, de la glace et de la neige en hiver; l'été est court. Les plantes alimentaires et les animaux domestiques sont bien ceux que signale le vocabulaire aryaque. On trouve le pin, le bouleau et le chêne. Les grands fauves n'y vivent pas. . . ." The bear may have lived there, or may have been brought there, and carried about, as he is in many a country of which he is not a native. And as to the absence of common Aryan names for the largest animals, "suppose that the elephant and the camel had really been known and utilized as beasts of burden by the united Aryas, when living in Asia, would it not have been most natural that, when transplanted to more northern regions, their children, who had never seen a camel or elephant, should have lost the names of them?" And if "Drs. Penka and O. Schrader have shown that the picture which linguistic palæontology has drawn of Aryan life previous to the separation coincides with the picture which archæological palæontology constructs from the neolithic remains discovered in Scandinavia" and the lacustrian dwellings of central Europe, "how would this prove that the Aryas were autochthonous in Scandinavia, or in Switzerland, or along the Po?"

In this way, and by a great deal of arguing, defensive and aggressive, Professor Müller makes out a very plausible case for the Central Asian theory, but one far from fully convincing; for, as he himself says, "the evidence with which we have to deal is so pliant that it is possible to make out a more or less plausible case" for many regions, Asiatic or European. He is not over-positive himself, and generally treats his opponents with studied courteousness, though he almost loses patience when the question of greater primitiveness is raised between his favorite Sanskrit and any language of the western Aryan branch. He is convinced that "even the blackest Hindus represent an earlier stage of Aryan speech and thought than the fairest Scandinavians," though, on the other hand, asserting and reasserting that when he speaks of Hindus, Greeks, Romans, Germans, Celts, or Slavs, he means "neither blood nor bones, nor hair nor skulls," but simply those who speak the respective language, whether inherited or adopted from a conquering or a conquered people. As to the history of the Aryan development—the date of the Aryan separation, the way it took place, or the rise of Sanskrit literature—he confesses almost complete ignorance, and his expositions of the relations of languages and dialects to each other, of linguistic growth and decay (not here originally presented), are marked by characteristic clearness and moderation; but in the comparative list of words, collected from the dictionaries of the seven principal languages of Aryan descent, from which a collective picture of "The Earliest Aryan Civilization" is to be abstracted, he more than once transcends the line which separates the certain and probable from the possible—as, for instance, when he connects Pers. *Yakh* (which is probably borrowed from a Turanian idiom; *cf.* Magy. *jég*, Ostyak *yenk*, ice) with Teut. *Eis*, *ice*, Zend. *isi*; Sansk. *gyâ*, bowstring, with Gr. βιός; or Sansk. *sâlya*, shaft, with Gr. κῆλον and κήρ.

Shakespeare in Fact and in Criticism. By Appleton Morgan, A.M., LL.B. New York: William E. Benjamin. 1888.

THE author of this volume begins one of his essays with a compliment to Richard Grant White. "The lamented Richard Grant White," he says, "was that rarest of all creations—a Shaksperian commentator with no nonsense about him." It is apparently the ambition of Mr. Morgan to follow in Mr. White's footsteps, and especially to have "no nonsense about him." Such a man necessarily begins by asserting that other persons in his trade have a great deal of nonsense about them; and consequently we find in these pages little more than a loud and heated denunciation of the æsthetic and scholarly commentators on Shakspere, and particularly of Mr. Furnivall. There has been, certainly, enough of "too curious considering" about the development of Shakspere's mind and art, and the legitimacy of intrinsic evidence has been strained to the extreme in obtaining more from the plays and sonnets than meets the ear, with reference to Shakspere's life and character; but Mr. White, on his side, also pushed to the extreme the opposite view, and by his negations was forced to end with turning Shakspere into a sordid person. Mr. White, however, had something to say in the occasional explosions of temper in which he indulged. He did not simply fume and call men fools and crazy-bodies, and think the argument done when he had only expressed his feelings violently; he showed some cause with which one might agree or not, independently of the critic's expletives. In the present volume, however, we find no unusual learning, no ingenuity or originality in dealing with the well-known materials, no critical power or penetration of mind which would entitle the writer to speak with authority or palliate his indulgence in violent language respecting the scholarly and cultivated, and sometimes eminent, men whom he attacks. If he had allowed himself towards them a small portion of the charity which he shows for the Baconians, with whom he agrees as little, the volume would have avoided its worst features. In the matter of his essays there is nothing which requires consideration.

Henry Holt & Co.

HAVE READY:

THE LIFE OF THOMAS HOPKINS GALLAUDET, Founder of Deaf-Mute Instruction in America. Square 12mo, with portraits, $1.75.

"The book has the subtle charm of the best biography."—*Hartford Post.*

UNCLE SAM AT HOME. By Harold Brydges. 12mo, illustrated, $1.25.

"Exceptionally bright, diverting, and readable. Satire and fact are mingled pleasantly for the purpose of describing America and Americans from a social and political standpoint. . . . Witty, ingenious, and instructive, and underlying the infectious humor is a strong foundation of common sense. . . . Spiritedly and cleverly illustrated."—*Boston Gazette.*

"Ought to be widely read, both because it is extremely entertaining, and holds the mirror up to some of the foibles and inconsistencies that we do not perceive, living in the midst of them. The book is capitally illustrated."—*Boston Times.*

"The book is one of the most readable and brightest that have issued from the press for a long time."—*Hartford Post.*

MRS. ALEXANDER'S 'A LIFE INTEREST.' Cloth, $1.00; paper, 30 cents.

HENRY HOLT & CO., New York.

GERMAN SIMPLIFIED. SPANISH SIMPLIFIED.

The following will be found eminently practical for self-instruction: (1.) German Simplified—Complete in 12 numbers (with keys), at 10 cents each. (2.) Spanish Simplified—12 numbers (with keys) 10 cts. each; No. 7 now ready; a new number on the first of every month; Sold by all booksellers. Sent, postpaid, on receipt of price, by Prof. A. Knoflach, 140 Nassau St., New York.

Germany.

PROF. A. FLEISCHMANN, *Eldena, Pommern.* Thorough study of German, French, and other branches. Summer resort for seabathing. Fine surroundings. Isle of Rügen, University of Greifswald. For circulars address PROF. J. M. CROW, Ph.D., Grinnell, Iowa.

CLARENDON PRESS NEW BOOKS.

AGENTS FOR THE UNITED STATES,

MACMILLAN & CO.

NEW WORK BY MR. ANDREW LANG.

Just published, tastefully printed in small 4to, on special hand-made paper, half vellum, gilt top, with Portraits, $3.75.

PERRAULT'S POPULAR TALES. Edited from the Original French Editions, with an Introduction on Fairy Tales, &c. By Andrew Lang, M.A., late Fellow of Merton College.

THE WIT AND WISDOM OF SAMUEL JOHNSON. Selected and arranged by G. Birkbeck Hill, D.C.L., Editor of the Oxford Edition of 'Boswell's Life of Johnson.' Tastefully printed in crown 8vo, cloth elegant, gilt top, $2.

"An extremely interesting book."—*Globe.*

NEW WORK BY DR. MARTINEAU.

A STUDY OF RELIGION; its Sources and Contents. By James Martineau, D.D., LL.D, late Principal of Manchester New College, London. 2 vols., 8vo, cloth, $6.

CONTENTS:

Book I.—The Limits of Human Intelligence Considered.
Chap. 1. Form and Conditions of Knowledge.
2. Appreciation of Kant's Doctrine.
3. Absolute and Empirical Idealism.
4. Relativity of Knowledge.

Book II.—Theism.
Chap. 1. God as Cause.
2. God as Perfection.
3. Unity of God as Cause and God as Perfection.

Book III.—Review of Opposing Systems.
Chap. 1. Pantheism.
2. Determinism and Free Will.

Book IV.—The Life to Come.
Chap. 1. Death in its Physiological Aspect.
2. Death in its Metaphysical Aspect.
3. Death in its Moral Aspects.

"The richest and most satisfying treatises on the intellectual and moral questions which concern ethics and religion that have appeared in the English language during the century. They are the monument of a lifetime devoted to the disinterested pursuit of truth. . . . One who has mastered these four volumes (the 'Types of Ethical Theory' and the 'Study of Religion') and the literature which they include in their range of thought has gone to the bottom of many of the problems which relate to the present and the future of mankind outside of a personal revelation from God."—*New York Times.*

BY THE SAME AUTHOR.

TYPES OF ETHICAL THEORY. By James Martineau, D.D., LL.D., late Principal of Manchester New College, London. Second Edition, 2 vols., crown 8vo, $4.50.

"The most important and original work which English Philosophy has produced for at least a century and a half."—*Spectator.*

MR. W. L. NEWMAN'S EDITION OF THE 'POLITICS.'

THE POLITICS OF ARISTOTLE. Edited with an Introduction, Two Prefatory Essays, and Notes Critical and Explanatory, by W. L. Newman, M.A., Fellow of Balliol College, late Reader in Ancient History, Oxford. Vols. I. and II. 8vo, cloth, $7.

Vol. I. Introduction to the 'Politics.' Vol. II. Prefatory Essays. Books I. and II. Text and Notes.

"A work of the first magnitude in its kind; . . . may prove the definitive edition for a long while to come."—*Oxford Magazine.*

"Mr. Newman's Introduction is an important contribution to political philosophy, and this edition of the 'Politics' when completed must rank as the standard one for British students."—*Scottish Leader.*

"A most conscientious, most interesting, and most important work."—*Saturday Review.*

PART I. OF A NEW SCHOOL GEOGRAPHY.

GEOGRAPHY FOR SCHOOLS. By Alfred Hughes, M.A., Assistant Master at Manchester Grammar School.

Part I. PRACTICAL GEOGRAPHY. With Diagrams. Crown 8vo, cloth, 60 cents.

This 'Practical Geography' is based on the results of several years' experience in the Modern side at the Manchester Grammar School. It has been found possible, within the limit of an ordinary term's geographical course to include the consideration of many classes of problems which are not usually treated at school.

A GREEK TESTAMENT PRIMER. An easy Grammar and Reading Book for the use of Students beginning Greek. By the Rev. Edward Miller, M.A., Rector of Bucknell. Fcp. 8vo, cloth, 90 cents. *Just Ready.*

HISTORY OF AGRICULTURE AND PRICES IN ENGLAND, A. D. 1259–1793. By J. E. Thorold Rogers, M.A. 8vo. Vols. I. and II. (1259–1400), $10.50. Vols. III. and IV. (1401–1582), $12.50. Vols. V. and VI. (1583–1703), $12.50.

"A work which should be in every good library, and will be from henceforward indispensable to the student of English history."—*Guardian.*

"Quite an indispensable book to all who wish to study closely our social and economic history."—*Academy.*

FOURTH AND NEW EDITION.

SPECIMENS OF ENGLISH LITERATURE, from the "Ploughman's Crede" to the "Shepheardes Calendar" (A.D. 1394 to A.D. 1579). With Introduction, Notes, and Glossarial Index. By W. W. Skeat, Litt.D. Fourth Edition, extra fcp. 8vo, cloth, $1.90.

NEW WORK BY THE DEAN OF WESTMINSTER.

LECTURES ON THE BOOK OF JOB. Delivered in Westminster Abbey by the Very Rev. George Granville Bradley, D.D., Dean of Westminster. Crown 8vo, cloth, $1.90.

** Uniform with 'Lectures on Ecclesiastes.'

"This scholarly and yet most effective and popular book. . . . No one who takes up the volume is willing to lay it down till he gets to the end of it. . . . A volume which could not have been written by a mere expert in Hebrew scholarship, or a mere layman who had not mastered the drift of the immense mass of modern and ancient criticism on this remarkable book."—*Spectator.*

A NEW VOLUME OF THE CLARENDON PRESS SERIES OF GERMAN CLASSICS.

BECKER'S FRIEDRICH DER GROSSE. Edited with Notes and Historical Introduction by C. A. Buchheim, Phil. Doc., Professor of German at King's College, London, editor of the Clarendon Press Series of German Classics. Extra fcp. 8vo, cloth, 90 cents.

"Dr. Buchheim, by his excellent edition of the German Classics, has done far more than any other man to forward the study of German in England and America."—*Westminster Review.*

A SECOND ANGLO-SAXON READER, ARCHAIC AND DIALECTAL. By Henry Sweet, M.A., author of 'An Anglo-Saxon Reader,' &c. Fcp. 8vo, cloth, $1.10.

The primary object of the present book is to give the student the means of making himself acquainted with the leading features of the non-West-Saxon dialects of Old English.

NEW EDITION OF MERRY'S 'ODYSSEY,' I.-XII.

HOMER—ODYSSEY. Books I.-XII. Edited with Notes, Introduction, and Synopsis of Homeric Forms. By W. W. Merry, D.D., Rector of Lincoln College, Oxford, editor of 'Aristophanes in Single Plays,' 'Selections from Herodotus,' &c. In one or two parts. Fortieth Thousand. Fcp. 8vo, cloth, $1.10.

"Mr. Merry's editions have revolutionized the study of Homer throughout the country."—*Oxford Magazine.*

THE THEORY AND USE OF A PHYSICAL BALANCE. By James Walker, M.A., Demonstrator at the Clarendon Laboratory. Demy 8vo, with lithographs, stiff covers, 90 cents.

Intended originally as a chapter of a book on Practical Physics for the use of students at the Clarendon Laboratory.

TRANSLATIONS OF FOREIGN BIOLOGICAL MEMOIRS. Translated under the superintendence of, and edited by, Professor J. Burdon-Sanderson, M.D., F.R.S. I. MEMOIRS ON THE PHYSIOLOGY OF NERVE, OF MUSCLE, AND OF THE ELECTRICAL ORGAN. Demy 8vo, cloth, $5.25.

LETTERS OF DAVID RICARDO TO THOMAS ROBERT MALTHUS, 1810–1823. Edited by James Bonar, M.A., Oxford, LL.D., Glasgow. 8vo, cloth, $2.75.

** "The following Letters are now printed for the first time from the original MSS., kindly lent for the purpose by Colonel Malthus, C.B. The collection covers the whole period of the friendship of the two men."—*From the Preface.*

MACMILLAN & CO., 112 Fourth Avenue, New York.

THE March Century

Contains a number of articles of unusual interest. They include:

Russian State Prisoners.

By George Kennan.

Further revelations of life in Russian prisons—"The Departure for Siberia" described by an exile; the touching story of the celebration of the Centennial Fourth of July (1876) by prisoners in the House of Detention at St. Petersburg, etc.

Some Pupils of Liszt.

By Albert M. Bagby, with portraits of Eugene d'Albert, Friedheim, Fraulein Aus der Ohe, and other noted pupils—Aus der Ohe's early life—her first public appearance at eight years of age, etc.

A Story by Helen Gray Cone.

"Hercules: A Hero," a character sketch.

Salisbury Cathedral.

One of England's most noted buildings described by Mrs. van Rensselaer, with eleven illustrations by Joseph Pennell.

The Libby Prison Tunnel.

An illustrated article of thrilling interest, narrating the escape of 109 Union officers from Libby Prison by night through a fifty-foot tunnel, dug with two broken chisels.

No accurate and complete account of this ingenious and daring undertaking, led by Colonel Rose, has before been printed. Captain Moran, who tells the story, was among those who escaped.

Bismarck.

The peculiar influence of the German Chancellor and the secret of his success—with two portraits.

"The Graysons."

By Edward Eggleston. In the present instalment of this widely-read novel of Western life, Abraham Lincoln is introduced as one of the characters. As already stated, the appearance of Mr. Lincoln in this story at the same time with the Lincoln History is a pure coincidence.

Immigration by Passport.

A question of increasing national importance considered by the Rev. Theodore T. Munger.

The Call to Arms.

Interesting chapters of the Lincoln History, by Messrs. Nicolay and Hay, describing the fall of Sumter and Mr. Lincoln's part in the affairs which led to it, the call for 75,000 men, etc.

The Home Ranch.

Cowboy life in the West, by Theodore Roosevelt, with nine striking pictures by Remington—"Roping in a Horse-Corral," "A Bucking Bronco," "Cruising for Stock," etc.

Franklin in France.

His home and host, by John Bigelow. With a reproduction of a drawing by Victor Hugo, and other illustrations.

The Departments

Contain brief papers on "The Public-School Probem," "Mind Training," "To the Deaf," etc. There are poems by C. P. Cranch, R. W. Gilder, and others, and the final chapters of George W. Cable's novelette, "Au Large."

All dealers sell The Century; price 35 cents. Ready everywhere on and after March 1.

The Century Co., New York.

"One must read The Century *if nothing else."*

BOOKS.

Priced Catalogues issued from time to time, sent gratis to any address.

The Nation.

NEW YORK, THURSDAY, MARCH 8, 1888.

The Week.

THE correspondence between Secretary Bayard and Sir Charles Tupper on this side of the water, and between Minister Phelps and Lord Salisbury on the other, anterior to the recent fishery negotiation, establishes beyond question the necessity of the Commission which has lately concluded its work. It shows that any other mode of reaching a peaceful solution of the difficulty was impossible, owing to the great distance between the two seats of government and the length of time that must elapse in exchanging notes respecting each grievance arising under the enforcement of Canadian fishing regulations. It proves that Mr. Bayard has been moved by the most sedulous care for the interests of his own country and of American fishermen. Whatever opinion may be held concerning the outcome of the negotiations, the good faith of the parties cannot be impeached. The moral effect of the negotiation has been most wholesome. Whether the treaty is ratified on our part or not, the *rapprochement* accomplished by it has been salutary. It has softened asperities everywhere except among the fishermen themselves, who, of course, "claim everything." It is significant of this softened feeling that the desire for reciprocity between the two countries is gaining ground. The most pointed evidence of this fact is the introduction of a joint resolution by Mr. Hitt of Illinois to promote commercial union with Canada. Mr. Hitt is the foremost Republican member of the House Committee on Foreign Affairs. The movement initiated by Mr. Butterworth of Ohio a year ago, and substantially endorsed by Senator Sherman in his recent speech in Boston, has secured so strong a reinforcement in Mr. Hitt that we may almost say that it is now an unproclaimed part of the Republican creed.

Mr. Joseph Chamberlain's speech on Friday evening left a very strong impression of the bona fides of all parties to the fishery negotiations. Good faith and an earnest desire on all sides to remove causes of dissatisfaction must commend the treaty to public approval in the end, whatever hasty adverse judgment may be formed at the outset. Mayor Hewitt gave a very brief and terse expression to this common-sense view of the matter after Mr. Chamberlain had concluded. His remarks were in notable contrast to the string of half-truths that the Chamber of Commerce was induced to give its sanction to a few days ago. The idea that we are giving an equivalent to Canada by offering her something that neither party wants, in exchange for something that she wants to keep and we want to get, is perfectly absurd. We do not believe that the resolution passed by the Chamber of Commerce expresses the mature opinion of that body, still less that of the commercial community of New York. Look for a moment at the situation of Newfoundland. The very existence of her people depends upon the fishing advantages which nature has given her. Take those away without an equivalent, and the inhabitants must starve or abandon their homes. "He takes my life who takes the means whereby I live." Newfoundland buys all her supplies from us. She has nothing but fish and fish-oil to give in return. She has bait and sailors and a base of operations for her dower and her livelihood, and she has nothing else. She asks in exchange for these the equal privilege of selling her catch in our market. These things were reserved to her in the Treaty of 1818, which we have elected to stand on in preference to that of 1870. Yet some of our merchant princes would take the bread out of the mouths of these humble people inhabiting the margin of storm-swept rock, on the ground that we have given them a fair equivalent when we have offered them bait and sailors and a base of fishing operations where there are no fish. Mr. Chamberlain has done something to dispel the prejudices born of ignorance and inattention which stand in the way of a ratification of the treaty. But the prejudices which grow out of a selfish desire to monopolize the American market will, of course, yield to nothing but superior force. The duty on pickled fish being at the bottom of all our fishery disputes, its eventual fate is involved in the larger tariff controversy that is now dawning upon us. What all good citizens should hope for is that no accident may happen in the meantime contrary to the peace of nations.

The Internal-Revenue Reduction Bill reported by the Committee of Ways and Means repeals the taxes on tobacco (not cigars and cigarettes), and reduces the various license taxes, the details of which are not yet published. The estimated reduction of the revenue from this source is $24,500,000, of which $16,000,000 comes from the excise duty on manufactured tobacco. It is stated that the licenses of retail liquor-dealers are to be repealed in favor of the States. These amounted last year to $4,587,268. In order to bring the total reduction up to $24,500,000, it will be necessary to repeal all the license taxes, including those on dealers in tobacco, cigars, and malt liquors, leaving in force only the excise duties on distilled spirits, cigars, cigarettes, snuff, beer, oleomargarine, and bank-notes. The internal revenue will thus be cut down to $94,300,000, the present taxes and licenses yielding $118,800,000.

The *Financial Chronicle* notes symptoms of tightness in the money market, growing out of the large collections of revenue and the locking up of money in the Treasury. Since the 1st of February, it says, there has been an addition to the net currency holdings in the Treasury vaults of $13,500,000, notwithstanding the Secretary has added to the deposits in national banks $2,500,000, and has sought to make the deposits larger, but has been unable to do so, the banks to which the deposits were offered declining to take them. The *Chronicle* considers this state of things dangerous, and urges speedy action by Congress "for immediate and liberal reductions of the revenue." It considers the bill reported by the Senate Committee on Finance "directing" the Secretary of the Treasury to invest in Government bonds 80 per cent. of the bank-note redemption fund, now amounting to upwards of $98,000,000, an extremely unwise measure, since it leaves no discretion to the Secretary, and virtually enables the bondholders to exact whatever premium they please. "It is a positive direction to invest $80,000,000 in bonds regardless of price at a time when the Government is expected to invest probably $150,000,000 of additional surplus in the same way." This is certainly very reckless legislation. We do not believe that such a bill can pass the Senate, however much the Republican party may desire to put the Secretary "in a hole."

The House has passed a bill authorizing the Secretary to invest the surplus in the purchase of bonds in his own discretion. This is a repetition of an existing law, and is passed to overcome the scruples of the Secretary, who has stated officially that he desires contemporaneous authority for so grave a responsibility. The rumor comes from Washington that the Senate will not act upon the House bill at all, taking the ground that it is mere surplusage to reënact an existing law concerning the surplus. If the Senate should adhere to this position, the Secretary would be obliged to recede from his, so far as to assume that the failure of Congress to rescind the existing authorization, after their attention had been called to it, was equivalent to a reënactment of it. A law is a law until it is repealed, and it is immaterial whether it was enacted by the Fiftieth Congress, or the Fortieth, or the First. There is probably some party spite in the refusal to consider the Secretary's scruples, but the Senate's position, if it shall take such a position, will be a defensible one. So much cannot be said of the bill reported by the Finance Committee, which leaves the Secretary no discretion as to the investment of $80,000,000, but invites the bondholders to corner the market against him.

Mr. Randall's remarks on the bill to authorize the Secretary of the Treasury to purchase bonds with the surplus revenues caused no little sensation on both sides of the House. His discourse on this bill led him to make some remarks on the coming tariff bill. He said that it had been given out that there was a conspiracy against the protective system of the United States. He did not believe that there was any such conspiracy. "I beg to say," he continued, "to those who have an affrighted fancy, that, so far as American industries are concerned, they are not to-day in any danger." In conclusion, he expressed the belief that the Democratic party would remain united. This means that Mr. Ran-

dall has decided not to oppose the Ways and Means Committee's bill, and thus land himself and his flock in the Republican party. This is wise. The Republicans have no use for Mr. Randall, except as a Democrat. If he were one of them, they would give his seat in Congress to some "old-timer" of their own. The significance of Mr. Randall's remarks is all the greater for this reason. It implies that Pennsylvania will make shift to get on even without a duty on wool, and with something less than $17 per ton on steel rails.

The remarkable feature of the pension debate which has been running in the Senate for the past week is the readiness shown by the Republican Senators to do the bidding of the Grand Army of the Republic, whatever that bidding might be. Mr. Manderson of Nebraska, in explaining the bill of which he had the management, said that he "had been charged by the Grand Army of the Republic with the duty of helping to pass this bill as it came from the hands of its Pension Committee." Mr. Davis of Minnesota, a Chairman of the Pension Committee, defended that Committee from the charge that it had brought in a carelessly drawn bill, by saying that "the members of the Grand Army of the Republic formulated the bill introduced by the Senator from Nebraska," and that "your Committee, when many of these features which have been called to the attention of the Senate were called to their attention, felt exceedingly loath to disturb the phraseology or the principles upon which it is based." Mr. Plumb of Kansas raised the question whether the bill really represented the wishes of the Grand Army, and Mr. Manderson replied that "this bill in exact language was formulated by the Pension Committee of the Grand Army of the Republic." The whole course of the discussion showed that the Republican members of the Senate were ready to pass any pension bill upon the assurance that the Grand Army wanted it, and that they considered the assurance that the Grand Army wanted it the only reason necessary to be given.

Senator Vest of Missouri told the exact truth when he said, of the pension debate, that the Senate had been engaged for some days past in a political auction for the "soldier vote," and he was abundantly justified in the satire which he employed in describing the various bids of the Republican candidates for the Presidential nomination. It is another illustration of the great advantage which the Democratic party reaps from having such a President as Mr. Cleveland, that his pension record enables Democratic Senators to feel a confidence of popular support in opposing the pension-grabbers which they never before experienced. Timid Democrats in Congress a year ago were afraid that his veto of the Dependent Pension Bill was going to harm the Democratic party, but they have learned that Republican papers were right when they declared that "the country will applaud and sustain him in it" (Albany *Express*); that "the veto will be generally approved by public sentiment throughout the country" (Troy *Times*); that "the people of the United States owe recognition to the courage of President Cleveland for his action" (Poughkeepsie *Eagle*); that "undoubtedly the country is with him" (Buffalo *Express*); that "the veto will prove a great public service" (Philadelphia *Press*); and that "he has justified himself at every point" (Chicago *Tribune*). The amazing thing is, that Republican Senators should fly in the face of public opinion as thus expressed by Republican papers.

It is very plain that all the friends of free wool are not in the Democratic party. Mr. McCreary of Kentucky having introduced a bill (H. R. 1473) for a pan-American conference, in order to promote arbitration for the settlement of disputes and "to encourage such reciprocal commercial relations as will be beneficial to all, and secure more extensive markets for the products of each of said countries," Mr. William Walter Phelps made a "rousing speech" in favor of it in the House last Thursday, and claimed the glory of this conception for Mr. Blaine, and taunted the Democrats with sluggishness and general ineptitude in that it had taken seven years for them to understand and appreciate the advantages of pan-Americanism in commercial intercourse. All that Mr. Phelps said was very fine, but what, we beg to inquire, becomes of the tariff on wool when the pan-American reciprocity treaty comes into force? Reciprocal commercial relations require the mutual repeal of duties. What are the dutiable articles that South America desires to sell to us? First of all, wool; second, copper and copper ore. Coffee, hides, and India rubber are already on the free list. When the pan-American conference that Mr. Phelps is so anxious for assembles, the first thing to be put into the reciprocity treaty will be wool and copper. Unless these are admitted free from the Argentine Republic, Chili, etc., the conference may as well not be held at all. It would be a lame and impotent conclusion to hold the conference merely to promote arbitration for the settlement of disputes. All that could be arranged without a conference. Indeed, we have so few disputes with South American countries, and they are so much accustomed to acknowledge our primacy in the affairs of the Western Hemisphere, that, however much a general system of arbitration might be to their advantage, it would not be to our advantage, because we have things pretty much our own way now.

Mr. Edward Atkinson has brought out in the last number of *Bradstreet's* his reply to Sir Morton Frewen, Mr. Bear, and other English critics who had called in question his statement made before the British Association for the Advancement of Science, that the American farmer could make as much profit to-day on wheat at 34s. per quarter in Liverpool as he could make at 50s. per quarter in 1873. The statement of Mr. Atkinson was made from his general knowledge of the cheapening of transportation and production since 1873. Mr. Bear and others denied Mr. Atkinson's statements very roundly and very sharply. He now publishes his justification in an article of three pages, not only sustaining his former statement, but affirming that American wheat growers can do as well with wheat at 28s. as they could in 1873 at 50s. In other words, he has lowered his margin as much as 6s. per quarter. The reductions in cost since 1873, which are shown separately and in detail by Mr. Atkinson, are as follows, in terms of English money:

Reduction in the railway charges...	11s. or more
Reduction in the steamer charges ..	5s.
Reduction in planting and reaping .	2s. or more
Reduction in milling and sacking...	3s. or more
Reduction in elevating, handling, etc	1s.
Minimum reduction per quarter..	22s.

Take 22s. reduction in cost from 50s., the Liverpool price in 1873, and we have 28s. as the equivalent which puts the American farmer on the same footing that he held in 1873. Mr. Atkinson gives his authorities for his several calculations, and we think that he has made out his case. The fact that wheat continues to go to Liverpool in large quantities at about 30s. per quarter, would seem to confirm Mr. Atkinson's original thesis, and to establish presumptively his later one.

Senator Sherman has bestirred himself and induced the Senate to pass a resolution requesting the President to negotiate a treaty with the Emperor of China providing that no Chinese laborer shall enter the United States. Mr. Sherman's motive is transparent—too transparent to effect its purpose. He has found that his votes against the Anti-Chinese Bills years ago have made him unavailable as a Republican candidate for President on the Pacific Coast, and he is trying to "make himself solid" on the other side of the continent by extraordinary zeal against the Chinese now. But it will not avail. The people will remember that he voted against the Anti-Chinese Bills when the issue was a vital one, and no death-bed repentance will atone for that offence.

In the long list of political Americanisms, we meet with no fitting name for christening the pet stratagem of our Florence statesman. His master-stroke is rejecting in good set terms a proffered and coveted honor, while all the while hoping that no number of refusals will prove a rebuff. The keen eye of the ancient comedians detected this weakness in Athenian demagogues who declined office with a view to making their election surer, and Philippides gave it the name *accismus*. Accismus is not to be found in Webster. Though never as yet discovered in any English book made to be read, it has been printed by Chambers, Smart, Worcester, and the New Dictionary, as if with prophetic instinct that it would be needed. Dr. Murray defines it "a feigned refusal of that which is earnestly desired." This form of words comes pat for describing Blaine's declinatures, and preëminently the last. We must always eke out our vocabulary with Greek. How could we do without telegraph, telegram, telephone, phonogram, telepathy, etc.? Let us thank the Greeks for teaching us accismus, which

our idiom may perhaps shorten to accism, as it contracts *schisma* to schism. Accismus is better than "still hunt," which befits a process rather than an action. It is better than *nolo episcopari*, which is worn out, and has an ecclesiastical squint, as growing out of the canon-law maxim, "Indignus est sacerdotio nisi fuerit ordinatus invitus." It is better than Cæsarism, which is consecrated to indicate cravings not for a first, but for a third Presidential term. In fine, a word in its newest gloss is demanded to brand the newest mock-modesty in our political aspirants.

The "Pauper Immigrant" Law was put to a curious test a short time ago when our Consul at Liverpool sent to New York a seaman who shipped on an American vessel at San Francisco, and who was left sick and crippled at his consulate. As a foreigner without means of support, he was not permitted by the Board of Emigration to land, and, with the concurrence of the Treasury Department, he was returned to Liverpool at the vessel's expense. Now, under an old and well-known law, our consuls are required to furnish relief to all American seamen found destitute within their districts. This relief includes board, clothing, medical aid, and transportation *to the United States*. The subjects of this relief must be American seamen, but the regulations of the Department of State have for many years included in this class all persons, of whatever nationality, who ship with an American vessel from one of our home ports. As a matter of fact, the majority of American seamen to-day entitled to the privileges mentioned are not American citizens. When left upon a consulate, they are not only entitled to be sent to the United States at the expense of the Government, but no master of one of our vessels can refuse to take them on board when the Consul requests it. The troublesome individual in this case was a foreigner, but he was, under the relief laws mentioned, an American seaman, and it was not possible for the Consul at Liverpool to refuse him transportation, or for the captain of the vessel to deny him passage, without incurring the penalties of the law. We understand that upon his return to Liverpool the Consul made a report to the Department of State, which led to a conference between it and the Treasury Department, resulting in an agreement that hereafter such seamen, known as "consuls' men," should be permitted to land unmolested.

The homicidal mania seems to be breaking out again at the South with renewed virulence. In Culpepper (Va.) two young editors, Mr. Barbour of the Piedmont *Advance* and Mr. Williams of the Culpepper *Exponent*, had a deadly encounter. As usual, "the families of both are very prominent in the county." The trouble arose over a satirical letter about Williams's uncle in the *Advance*, signed "Jack Clatterbuck." Barbour resented it bitterly in the *Advance*, and after several exchanges of vituperation came the usual closing observation, that Williams was "a little dog barking at a gentleman's heels." Thereupon Williams "armed himself" and went to see Barbour, and then Barbour's first shot went through Williams's heart, and Barbour also fell to the floor dangerously wounded. "The excitement over the tragedy" in the county is, we need hardly say, "intense." About the same time a "terrible battle occurred among citizens of the Fifth District of Monroe County," Miss., at a meeting of school trustees to consider the action of a teacher who had expelled some pupils. The affair had been arranged, and the meeting was breaking up when the "difficulty" suddenly broke out. James Bailey, jr., killed R. A. Rutledge and his son Edward and Benjamin Fish, and shot off accidentally one of his own brother's fingers, and then made his escape through a window, receiving a shot in the ribs and a stab in the back as he fled. There were others as active and energetic as Bailey, but no record has been kept of their deeds. The school-house is riddled with bullet-holes. How the teacher fared does not appear, but he probably escaped. The affair, we need hardly say, "has created a great sensation in that portion of the country, and may not be over yet." In fact, we fear "the battle" was only adjourned. The friends of the dead Rutledges have to kill some one in order to close up the account. The bullet holes in the school-house will remind the children of what the Fifth District of Monroe County expects of them when they get their pistols and enter on manhood.

That a clever novelist may not be a wise judge of public affairs surely should need no demonstration, and yet it is difficult to see what else than this is shown by the long article on "The Negro Question" which the *Tribune* on Sunday published from the pen of Mr. George W. Cable. The substance of it all is that Mr. Cable is greatly discouraged over the present situation, and that he does not have faith that time will work an improvement, while he has, after all, no definite remedy to suggest. Really, it is hardly worth while for a man, even though he be a good story writer, to fill seven long columns of fine type in a newspaper to reach so lame and impotent a conclusion as this. Mr. Cable shows an ignorance alike of past developments in the North and of present tendencies at the South, which unfits a writer for intelligent and candid treatment of the subject. He talks as though, on the one hand, the negro everywhere in the North received as fair treatment as the white man, and as though, on the other hand, no progress in the right direction were anywhere making in the South. Both of these theories are fallacious. In Brooklyn, "the City of Churches," the negro who goes to the theatre, even as a Grand Army man at a Grand Army entertainment, is relegated to the gallery, whatever his wealth or standing, and in Ohio and Kansas negro parents, within a few months, have had to fight through all the courts the most bitter opposition to the admission of their children to schools attended by white children. Of the progressive tendency at the South it is sufficient to cite two illustrations. Mr. Cable complains that "an expensive isolation of race from race is kept up even in the teachers' institutes," whereas this isolation was broken down in Kentucky some years ago and is beginning to yield in North Carolina. At the recent public reception to the President in a hotel at Jacksonville, Fla., negroes were admitted on a perfect equality with whites. Mr. Cable is unduly depressed.

The truth is, that there is no possible offhand solution of the negro problem at the South. It was never solved, so far as it has been solved, in any such fashion at the North. The negro did not secure his rights in the North summarily. In 1865 Connecticut gave 6,000 majority against an amendment to the Constitution giving him the right to vote, and Minnesota 2,500 majority against a similar amendment. In 1867 Kansas refused by 9,000 majority to strike out the word "white," and Ohio gave 38,000 majority the same way. It was more than twenty years after the close of the war before Ohio, which meanwhile had been boiling with indignation over the maltreatment of the negro at the South, reached the point of abolishing the last of the "black laws"; and even then communities which prided themselves upon being educational centres fought bitterly against mixed schools, carrying the controversy up to the Supreme Court, which has just decided that they must yield. When Mr. Cable has lived longer at the North, and learned more of its history, he will find it necessary to reconstruct the theories which he has ignorantly framed as to the race line in this part of the country. Meanwhile, it is to be hoped that he will not be more impatient with his old neighbors in the South than Northern people, who have noted the slowness with which race prejudice has declined under the most favorable circumstances here, and who have a great deal of charity for their brethren in a region where even slower progress is reasonably to be expected.

The strike in the Lehigh collieries, which had been dragging along for six months, collapsed utterly on Friday, when all the strikers made a rush for reëmployment on the old terms. All were taken back except the leaders, who have not only been refused employment by the companies, but find themselves so bitterly condemned and distrusted by the strikers that they are likely to have to leave that part of the country. The men declare not only that they were duped by their leaders, but that the latter have made a great deal of money out of the strike. Of course they have—that is what most strikes are for. It is most encouraging to find the duped workingmen coming to a realization of this truth. A curious fact about this strike is that it lasted precisely as long as the strike in the anthracite region in 1877, which seems to show that six months is the maximum period during which miners are able to subsist without work.

THE TARIFF BILL.

THE bill reported by the majority of the Ways and Means Committee is so moderate in its reduction of duties, and so little calculated to disturb or unsettle any established industry, that the Republicans in Congress will have to strain themselves heavily to make any kind of fight against it. It does not go beyond the average reduction recommended by the Tariff Commission of 1883, although differing in details from the bill then recommended. It is in harmony with the recommendations of Senator Sherman and Representative Dawes in 1872, made at a time when there was no necessity pressing upon the Government to reduce a surplus revenue, as there is now. In his speech supporting tariff reduction in that year Mr. Sherman said :

"It must be remembered that the present duties, taken together, are far in excess of what they were before the war, and that they have been three times largely increased since the passage of the Morrill Tariff Act of 1861. . . . The result of such duties is to secure to mechanical industries higher wages than can be earned in other kindred employments. Such excessive protection not only ceases to diversify production, but forces labor into protected employments. If the present rates of duty were high enough during and since the war, when home industry was burdened with heavy internal taxes—with stamp duties, income taxes, and high rates on raw materials—then, surely, they are now too high when all these taxes are removed. . . . I have listened with patience day by day to the statements of gentlemen who are interested in our domestic productions. I am a firm believer in the general idea of protecting their industries, but I assure them, as I assure their representatives here, that if the present high rates of duties, unexampled in our country, and higher by nearly 50 per cent. than they were in 1861, are maintained on metallic and textile fabrics after we have repealed the very internal taxes which gave rise to them, and after we have substantially given them their raw materials free of duties, we shall have a feeling of dissatisfaction among other interests in the country that will overthrow the whole system, and do greater harm than can possibly be done by a moderate reduction of the present rates of duty. And I am quite sure that intelligent men engaged in the production of various forms of textile and metallic fabrics feel, as I do, that it is wiser and better to do what is just and right, to make a reduction in their products, at least to the extent of the reduction in this bill on their raw materials, rather than to invite a controversy in which I believe they will be in the wrong."

That all that Mr. Sherman then said is applicable to the present tariff, and more, is evident from the fact that the average rate of tax on dutiable goods is nearly 4 per cent. higher now than it was then. It should be remarked also that, although protective tariffs have been maintained in this country continuously for ninety-nine years—that is, during the whole period of our national existence under the Constitution—they are now higher than they ever were before in our history, being upwards of 47 per cent. average on dutiable goods, the highest previous tariff (that of 1828) having averaged only 43 per cent.

The circumstances being such, and the necessity of bringing the revenue down to the measure of the public expenditures being immediate and pressing, we are not surprised to find that the Republican attack upon the bill is made rather upon the mode of its preparation than upon the merits of the measure. It is called a "dark-lantern bill," because the majority of the Committee did not admit the minority into their confidence while it was in course of preparation. The answer to this is, that the minority have it now, and can try their teeth on it to any extent. They can offer as many amendments now as they could have done at any time. The darkness has been dispelled and the light of day has burst upon the scene. The disclosure is by no means dreadful. American industry is not flat on its back. The earth will still yield her increase, even though wool goes on the free list, and certainly manufacturing industry will not be harmed by that proceeding, or by the corresponding reduction on woollen goods. The truth is, that we have been importing the wool in the form of cloth that we ought to have imported as wool and manufactured ourselves. The wool tariff is the very key and pivot of the tariff situation, and the repeal of the duty on that article is the chief merit of the present bill, regarded as a measure of industrial reform.

The greatest merit of the bill is that it reduces the revenue $50,000,000. The calculation of the Committee is that the reduction on sugar will be $11,000,000, on raw materials $22,250,000, on woollen manufactures $12,000,000, and on miscellaneous articles $5,000,000. In order to secure the requisite reduction, say $70,000,000, and to provide against possible increase of importations of some articles on which the duties are reduced, but not repealed, it will be necessary to cut down the internal revenue by $25,000,000 to $30,000,000. Of the measure by which the Committee propose to effect this reduction, we have spoken on another page.

Looking at all the difficulties surrounding the Committee, and considering the enormous jungle and morass that the present tariff has placed in their way, we think that they have done very well. Undoubtedly changes of detail will be made before the bill comes up for general debate, but the public will not fail to bear in mind that the most menacing condition that is or can be placed athwart the country's pathway, industrially and morally, is the piling up of money in the Treasury for which the Government has no honest use.

THE PUBLIC AND THE LOCOMOTIVE ENGINEERS.

A MEETING of delegates from fifteen divisions of the Brotherhood of Locomotive Engineers was held in Tammany Hall on Sunday, at which the following curious preamble and resolutions were passed:

"Whereas, It is learned from good authority that the managers of the various railways throughout the country have combined in secretly aiding and assisting the management of the Chicago, Burlington and Quincy Railway in their present trouble, and

"Whereas, Such action on the part of said managers is cowardly and unfair, therefore be it

"Resolved, (1.) That we, as representatives of the various divisions of the Brotherhood of Locomotive Engineers in this vicinity in convention assembled, do hereby denounce said action on the part of said managers, and declare that we, as an organization, are justified in resorting to extreme measures in overcoming this outside interference with the affairs of our brother engineers upon the Chicago, Burlington and Quincy Railway.

"(2.) That to this end we recommend that, if the aforesaid difficulty is not settled within a reasonable time, upon a fair and reasonable basis, all the Brotherhood men upon the connecting lines of the Chicago, Burlington and Quincy system will resign their positions upon a given date.

"(3.) That if this action, as a means of last resort, is not sufficient to gain the just and reasonable demands of the engineers and firemen upon the aforesaid railway, we, as an entire organization throughout the United States, Canada, and Mexico, join issue with them in a universal demand for their acknowledged rights—of being paid the established rates for work actually performed."

One of the oddest hallucinations of labor agitators and organizers is the notion that they can somehow start a select little society which will be so strong that it will, by doing something on "a given date," in obedience to a preconcerted signal from somebody, be able to bring the whole American people to their knees, and be able to exact from them such concessions as are usually made only to the demands of a conquering army. Poor Powderly had this dream in his weary head when he started the Knights of Labor. His notion was that by getting all the trades into one organization, ruled despotically by a small Council, he could order "general strikes" on a "given date," and thus bring all the industry of the country to a standstill, and compel the community to treat with the Grand Master Workmen and the General Worthy Foremen as it would treat with the commander of an invading force which had just crushed the last attempt at armed resistance.

The public has been for some years—in fact, for nearly as long as people in our time remember any news of the day which does not concern them personally—accustomed to hearing Mr. P. M. Arthur and the Brotherhood of Locomotive Engineers spoken of as a very conservative, prudent, and public-spirited body, forming a marked contrast in their management of their affairs to the other trades-unions. This view of them, too, has been fully justified by their course during the past ten years, and no journal has been more careful to take it than the *Nation* has been. We have refrained from any allusion to the hot-headed and demagogic beginnings of Arthur's career as a labor agitator. But now that he seems disposed to repeat his old follies, and convert every trade dispute into an attack on the whole community, and to try to paralyze the business of a whole nation, in order that a few hundred men may force a corporation to employ them at rates fixed by themselves, it seems time to recall his earlier performances as a labor manager.

He succeeded in 1873, as head of the Brotherhood, a very conservative man named Wilson, who refused to countenance a strike on the leased lines of the Pennsylvania Company in that year. When he took office, he was full of fight, and began a policy of steady striking on the New England roads. His strikes, being novelties both to the public and the roads, were mostly successful. The roads succumbed because the public opinion was in that early, rudimentary stage in which everything that "Labor" did or said seemed right. His plan of operations at

that time was to decide on a strike secretly and give secret instructions to the engineers as to the hour at which the strike was to take place. Two hours' notice, and only two hours' notice, was then given to the company, and when the time came every engineer stopped his train wherever it happened to be, and stood by the engine for two hours more to give the company an opportunity to give way. If by that time it had made no concession, he took himself off, though we believe it was not uncommon for him to detach the locomotive and convey himself to the nearest station, leaving the train standing in the middle of the track, no matter how many passengers it contained, or what was the season or the weather. One of Arthur's strikes, and the most atrocious of all, was carried out in this manner on the Grand Trunk Line, in December, in the midst of Canadian snow and ice; and trains containing women and children were abandoned on the track, far from towns or houses, and men who were sent to work the engines were actually mobbed and driven off by the ruffians of the Brotherhood, acting under his directions.

At last, however, the companies were roused into resistance by Arthur's growing audacity. He had carried through five strikes in six months, and had boasted at a meeting of his followers in Faneuil Hall that he had only "to raise his hand to stop every railroad running out of Boston." This impudence was more than the community could stand, so when he made an onslaught on the Boston and Maine Road early in 1877, he was collared and subdued. His formal demands in this case were small—ten cents a day increased pay to sixty-seven men; but the real question involved was whether an irresponsible agitator should be allowed to take the management of the road out of the hands of the owners, and in defiance of the community. The corporation resisted him. They secured men enough to run a few trains during the first two critical days. To one of these men $1,500 in cash was offered if he would leave his engine; another was assaulted and badly beaten; and all of them were coaxed, or jeered at, or threatened and insulted from one end of the line to the other. But the company triumphed. In a few days it had the line in working order, and the public feeling ran so strongly in its favor that Arthur did not dare to carry out his threat of a general strike on the Boston roads. Had he done so, it would have been immediately met by the introduction into the Legislature of a law forbidding any corporation, under heavy penalties, to intrust a locomotive to a member of the Brotherhood. Such a measure, based on the principle that these men paid their highest allegiance to another power than the law of the State, and could not be relied on not to abandon trains full of passengers in dangerous positions, was, we understood at the time, drafted and ready for immediate submission. But it was not necessary. Arthur paused in his mad career, and was so sobered by the exhaustion of the funds of the Brotherhood in supporting the men whom he had induced to strike, that he turned over a new leaf, became the enemy of strikes, and a most useful and influential apostle of conciliation and moderation, and such he has remained until now.

We have no criticism to offer here on his quarrel with the Chicago, Burlington and Quincy Road. He may be right in his contention that the engineers ought not to be paid according to their experience and skill, and the responsibilities put on them, although, if he be, it must be because drivers of locomotives differ in mental and moral constitution from the rest of mankind. But his engineers have left the employment of this corporation voluntarily, and for reasons that seemed good to them. What they are now contending for is the right to be employed, at a rate of wages fixed by themselves, by men who do not wish to employ them on any terms. This is, in the eyes of the rational portion of the American people, a ridiculous claim; but, whether ridiculous or not, they will not permit a business dispute between one small knot of laborers and one railroad, or factory, or mine, to be made the pretext for suspending the trade and transportation of the entire nation, and threatening large cities with scarcity of food and provisions. The man who supposes that this will be submitted to is more foolish than we believe it is likely for any one who has had Arthur's experience ever to become. Therefore we trust he will cease his vaporing, and either settle his quarrel with the C., B. and Q., or give up trying to settle it, and go into some other line of activity. His threats just now are those of a public enemy, and he must be careful or he will get himself treated as such. The community will not put up with insolence from a person of his dimensions which it would resent by a great war if it came from a foreign statesman. If he has the power he says he has, it ought to be taken away from him; if he has not, and is trying to get it, he ought to be stopped.

THE FINANCIAL SITUATION OF MEXICO.

It is only within the last few years that an attempt to give an idea of Mexican finances has been worth the making. The finest calculation might be sponged from the slate, without warning, in the whole chaotic period between 1821 and 1876. Indeed, one of the things which have sorely bothered the heads of the statesmen of Mexico, not to speak of students of her affairs, has been the puzzle of determining the resultant of the various conflicting adjustments and compromises effected, from time to time, in regard to the national debt. Since the comprehensive financial legislation of 1885, however, something like method has been introduced into the madness of this part of the problem. And when we add the solidifying influence of twelve years passed without a revolution, the new impulses given to national development and foreign commerce, the greater regularity in governmental income and expenditures, we find ourselves in a position to arrive at a fair approximation to the true financial situation of Mexico to-day. The greatest single obstacle now in the way is the lack of clear and accurate statistics. In the last report of the Secretary of the Treasury appears a brief historical sketch of the glaring imperfections of the reports of his predecessors, in which it is admitted that, with all the improvements made in the *Memorias* of the present, they still come far short of presenting a full and satisfying account of the nation's finances. This can easily be assented to. Still, the material available is sufficient to enable one to indicate results broadly, and with a degree of accuracy perhaps as great as is necessary.
